The chairman of the London-Brighton & South Coast Railway, C. Macrae, made it quite clear at the annual meeting of the company that while the electrification of the London suburban lines would be continued as circumstances permit, the conversion of the main line to Brighton is still a matter for the future. He said that the extension of the electrical system to the railway from Balham Junction to West Croydon, which passed through a congested area, was nearing completion, and it was hoped that this section would be open for electric traction by Sept. 1 next. This section, however, formed only a small part of the whole scheme which had been prepared by the company's consulting electrical engineer, Sir Philip Dawson. The full scheme had been submitted to the Ministry of Transport, and it included the electrification of the whole of the suburban area as well as the equipment of the main lines to Brighton and Lewes, with which in course of time it was hoped to proceed. The outlay of capital would be very considerable, and as the present time was not opportune for raising money the directors had determined that until the times improved extension of electrification should be confined to those sections of the suburban system where the needs were greatest. The grouping and amalgamation of companies, as provided by the Railways Act, 1921, was having a paralyzing effect on schemes of electrification. The London & Brighton Company was to be amalgamated with the South Eastern & Chatham and the London & South Western Companies. Each of these companies had a different system of electrification, so that there was a bar on the London & Brighton Company going ahead with its own program. The Ministry of Transport had, however, appointed a committee to report on the steps advisable for the companies concerned to take on the electrification schemes they had in contemplation. In regard to capital for developments, the directors had thought that there might be a possibility of obtaining powers from Parliament to raise money by borrowing without being put under the obligation that the exercise of borrowing powers should be contingent on a previous issue of three times the amount of share capital. Application was made for a Parliamentary bill for the purpose, but objections were raised by debenture and preference stockholders and others. In the meantime the appointment of the Ministry of Transport committee above referred to was made, and as the main reason for the promotion of the bill was to obtain capital for electrification work, the advisability of waiting for the report of the committee became obvious. The directors had accordingly deemed it wise to withdraw their bill from Parliament.

R. H. Wilkinson, general manager of Bradford Corporation Tramways, in the course of an inquiry regarding an application by his municipality for further borrowing powers, made the remarkable statement that owing to the increased cost of tramway track construction 75 per cent of the town Council's lines would eventually have to be abandoned unless some form of transport cheaper than the tramcar was adopted.

Surface Lines Spurred to Advertise

The London County Council, spurred on no doubt by the intense competition of motor buses, continues to advertise its tramway undertaking vigorously. A recent poster informs the public that the total cost of the system has been £14,500,000, and that the capital repaid out of revenue to date amounts to £6,000,000. The sum paid last year for interest on and redemption of capital was £600,000. It is proudly added that when the balance of capital indebtedness has been paid off Londoners will own the finest tramway in the world, and debt charges will be nil.

The first year's working of all-night tramcar services in Glasgow has resulted in a loss of £1,098.

At the British Industries Fair, held in London early in March, an exhibition of some of the artistic designs for London underground railway posters received much attention from foreign buyers who visited the Fair.

In the House of Commons on March 13 it was officially announced that the Treasury had agreed to guarantee a loan to be raised by the London underground railway companies for the extension and improvement of its tube railway system. This means that the long-contemplated developments are likely to be put in hand soon.

Paving Requirement Modified

Commission Unwilling to Pass Added Burden of New Paving on to Car Riders

In spite of a contract calling for repairing of Yale Avenue, Swarthmore, Pa., the Philadelphia (Pa.) Rapid Transit Company has been freed from all obligations except those included in repairing its own tracks and paving between them and for 18 in. on either side. This decision, handed down by the Public Service Commission on Aug. 16, 1921, and just published, is based on the principle that the ordinance provisions were unjust and unreasonable, would result in increased expenses to the company that would devolve upon the public and that anything which stands in the way of securing reasonable and adequate service or imposes upon the public an unnecessary burden of increased rates opposes the public policy of the State.

The borough of Swarthmore, in submitting the case to the Public Service Commission, protested that the municipal ordinances should be the factor used by the Public Service Commission in determining the duties of the railroad company. The company admitted the jurisdiction of the commission, as did the city, but contended that its duties must be determined by the commission upon the facts disclosed by the evidence by applying the commission's principle of what is a just and reasonable standard.

The report of the commission reviews the history of the case and shows that the Philadelphia, Morton & Swarthmore Street Railway and the borough of Swarthmore made a contract in September, 1900, whereby the traction company was given permission to operate on the streets of the borough, and in return agreed to reconstruct the paving on Yale Avenue from curb to curb. Under the type of paving adopted originally and with the wear and tear to which the roadway was then subjected the cost to the railway of meeting its paving obligation was about $490 a year for the entire area involved. Since then, however, the situation had changed and the type of paving originally installed had become entirely inadequate. When the time came to pave with new and more expensive material it was sought to shift the added burden to the railway.

The commission pointed out that the railway offered evidence, which was not contradicted, to show that its total annual revenues from the Borough of Swarthmore in 1919 were $10,080 and its yearly operating expenses in conducting that service $9,070. It is obvious, therefore, according to the commission that if the complainant's contention was sustained and the ordinance provisions made enforceable, either in the courts or before the commission, one of three eventualities would occur:

(a) The company would be so shorn of revenues that the public, including the Borough of Swarthmore, would ultimately be deprived of all street car service.

(b) The rate of fare imposed upon the Swarthmore patrons would be increased so high as to be practically prohibitive.

(c) The financial burden of maintaining the Swarthmore service would have to be passed on to and be borne by other car riders of the Philadelphia Rapid Transit Company in Philadelphia and elsewhere, who are not immediately concerned in the Swarthmore service.

In consequence of the condition of affairs thus recited the commission ruled as follows:

> Any or all of these contingencies are violative of the basis upon which proper public utility regulation rests. The utilities no longer function as private enterprises. They have public duties to perform. They are required to render adequate service at reasonable rates, and the rates must produce the revenue to maintain that service. To require the car riders to pay what would appear to be exorbitant rates, or to accept the alternative of being obliged to forego the benefits of all service because the operating company's revenues are required to be diverted in order to meet such ordinance obligations, is as unwise a public policy as it is bound to be destructive of the service which the public require and which such carriers are expected to render.

In short, the commission, after reviewing briefly the intent of the legislation creating that body, said that "it would be a waste of argument to attempt to establish the obvious, namely, that the commission is called upon to exercise the police power of the State when rates are involved, but cannot do so where service, facilities and practices, affecting intimately the same public, are involved."

Wage Agreement Reported

Railway employees of the Dominion Power & Transmission Company, Hamilton, Ont., are reported to have reached an agreement on wages as a result of the efforts of a board of conciliation which was appointed under Federal labor laws to arbitrate the dispute. The proceedings of the conciliation board were interrupted while the parties were brought together. The definite results were not announced, but it was stated that a basis of agreement had been arrived at and that when the contract is drafted it will receive the ratification of the board of conciliation without further litigation.

New York Hearings Postponed

Frank Hedley, president of the Interborough Rapid Transit Company, New York, N. Y., said on March 24 at the hearing of the Transit Commission that he would advance his program for the purchase of 350 cars now contemplated during the next five years if the Interborough could get from the Manhattan Railway, which owns the elevated railway system, a reduction in the present rent for the elevated lines.

Mr. Hedley said that if the city would provide the necessary storage yards and shop facilities, and if there were no difficulties about power, it would be possible to begin to put the cars into service in about seven months after a start was made. The purchase of additional cars would permit the Interborough to extend its period of maximum operation so as to spread the rush-hour traffic over a longer time.

Ex-Justice Clarence J. Shearn, special counsel of the commission, said Mr. Hedley would be questioned concerning the possibility of improving the service in non-rush hours at a subsequent hearing.

Upon the representation of James L. Quackenbush, general counsel of the Interborough, that the crucial period in the negotiations of that company with the Manhattan Railway for a reduction of rent would occur during the week ended April 1, the commission adjourned its inquiry into Interborough service until the afternoon of March 30 and agreed to postpone the Interborough valuation hearing, scheduled for March 29, for a week. Mr. Quackenbush said that Dwight W. Morrow of J. P. Morgan & Company, representative of the 5 per cent bondholders, was expected to return on March 27.

Engineering Congress Should Be Internationally Promoted

A very pronounced feeling exists in engineering circles in Washington, D. C., that the proposed Engineering Congress to be held in connection with the Philadelphia Sesquicentennial should be promoted in a national and international way, and that this can best be done by the Federated American Engineering Societies. Local promotion of the congress would be handicapped, it is believed, by the assumption that Philadelphia engineers naturally would be inclined, by the incidental benefits to their city, to represent such a gathering as certain to be a momentous occasion. If the arrangements were handled by the national machinery which the organizations in many branches of engineering have set up it is believed a distinctly different impression will be created.

Another Subway Plan for Chicago

Committee of Local Engineers Prepares Plan for Local Transportation Committee, Giving Locations and General Designs for Initial System in the Central Business District

A COMMITTEE of five Chicago engineers comprising Bion J. Arnold, chairman of the Board of Supervising Engineers, Chicago Traction; R. F. Kelker, Jr., city supervisor of transportation; Harold Almert, representing the American Society of Engineers; Charles E. Fox, Illinois Society of Architects, and Joseph H. Prior, Western Society of Engineers, appointed by the local transportation committee, Chicago City Council, made its report to the transportation committee on March 27, presenting locations and general designs for an initial subway system.

This committee of engineers has served without pay as the result of a resolution passed by the transportation committee of the City Council on Feb. 21, 1922, requesting recommendations for its guidance.

The engineer committee recommended the immediate construction of two east and west and one north and south low-level subways for the use of surface cars, and one high-level north and south subway for rapid transit purposes. The surface car subways are planned for Washington Street and Jackson Boulevard, extending from Grant Park on the east to Clinton Street on the west; and under Clark Street, extending from Thirteenth Street on the south to Grand Avenue on the north. The subway for rapid transit purposes would be located under State Street and extend from a junction of the South Side Elevated Railroad at Eighteenth Street to Division Street on the north, thence west in Division Street to a junction with the Northwestern Elevated Railroad near Franklin Street.

The Washington Street surface car subway would be connected with the present Washington Street tunnel under the river, which is so constructed that connection could be made to it at either end without changing the permanent structure. The subway under Jackson Boulevard would connect with the tunnel under the river at Van Buren Street. Through these two east and west subways, about 80 per cent of the surface line cars that now serve the northwest and southwest portions of the west side could be operated. The Clark Street subway would serve to handle approximately 45 per cent of the surface cars now operating through the business district and serving the north and south parts of the city. It could take care of practically all of the through-routed cars, while the morning and evening rush-hour trippers could be operated on loops now in place on the surface. These three surface-line subways would all be built with two tracks.

The engineers estimate that the Washington Street subway could be constructed as a tunnel and not seriously disturb the present utilities in the street, at a cost of approximately $4,500,000. The subway in Jackson Boulevard could be similarly constructed at a cost of about $4,900,000. Owing to the limited space between the top of the Illinois Tunnel Company's structure and the surface of the street, the construction of a subway in Clark Street would necessitate taking care of the utilities now in the street by means of suitable utility galleries. For this reason the engineers estimate the cost of this subway, including the cost of taking care of the utilities and the new tunnel under the river, at about $9,000,000.

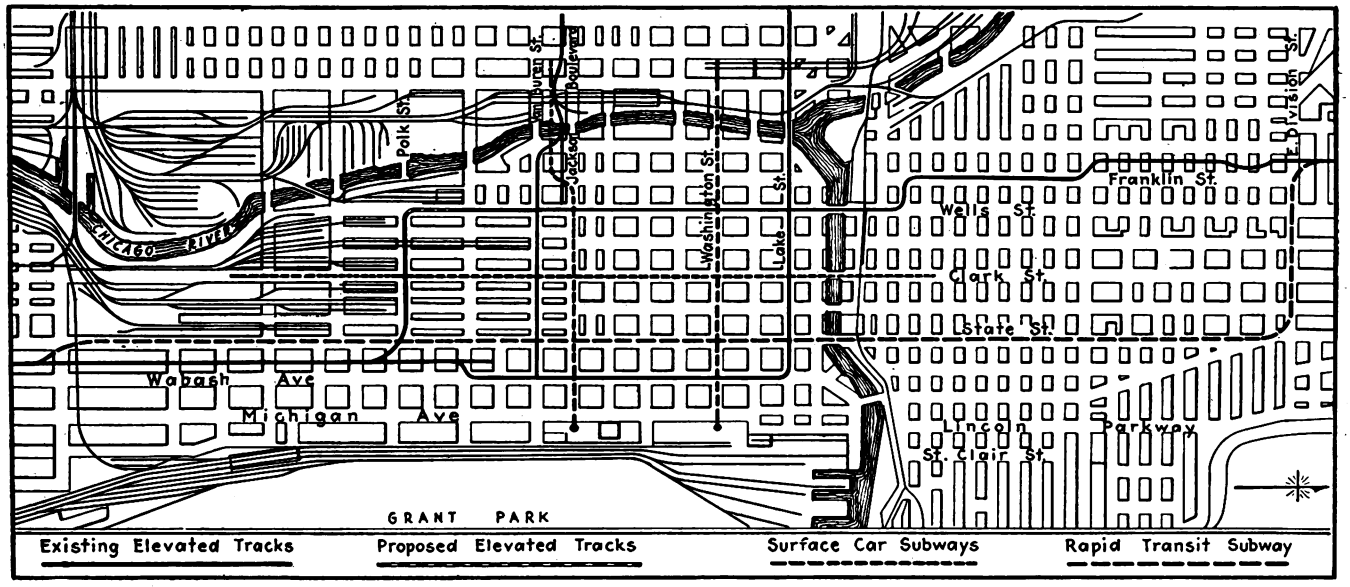
Stations for these surface-car subways would be located between State Street and Michigan Boulevard in both of the east and west tunnels. There would also be two transfer stations, each two blocks long, in the Clark Street subway, one at Jackson Boulevard and one at Washington Street, and each having an extension westward from Clark Street to Wells Street. There would be a through station on Clark Street at Harrison Street.

Rapid Transit Subway

The rapid transit subway would be constructed as a two-track low-level subway in State Street, so arranged that it can later be made a four-track subway. Owing to the limitations imposed by the location of the Illinois tunnel, the construction of this subway would necessarily involve taking care of the property of the utility companies now in the street. The engineers state that this can best be accomplished by locating the two tracks first constructed on one side of the street, preferably the west side, permitting the construction of the complete unit on the west side of the street including the utility gallery, and thus not preventing the building of the east tracks, with their utility galleries, when needed for a comprehensive subway system.

Stations of sufficient length to accommodate ten-car trains would be located at Twelfth Street, Harrison Street, Jackson Boulevard, Washington Street, Chicago Avenue and at Division and Clark Streets. The estimated cost of this subway is $16,000,000.

If the State Street subway is constructed as described, the engineer committee states that it could be best utilized in conjunction with the present elevated system, but that this would involve the construction of an extension of the elevated system in Wells Street from Van Buren Street to Polk Street, and then east to a connection with the main line of the South Side Elevated Railroad. This would involve an ex-



MAP SHOWING ROUTE OF SURFACE CARS AND RAPID TRANSIT SUBWAY LINES PROPOSED BY ENGINEERS TO CHICAGO COUNCIL COMMITTEE

Digitized by Google

penditure of about $1,200,000, which should be furnished by the elevated railroad companies. Arrangements should be made at the same time for the elimination of the grade crossings on the elevated lines at Van Buren and Wells Street. This extension and grade separation, if built and operated in conjunction with the State Street subway, will double the track capactiy of the elevated lines serving the West Side.

The subway system as just described is so planned as to form the nucleus of and connect up with any one of the three comprehensive plans previously submitted to the local transportation committee, namely, the Arnold plan of 1911, the Harbor and Subway Commission Plan of 1913 and the Chicago Traction and Subway Commission plan of 1916. All of these systems provide for either the unification of existing transportation systems or the independent operation by the city of a comprehensive rapid transit subway.

A summary of the total cost of the initial subway scheme as recommended by the committee of engineers follows:

Washington Street Subway	$4,500,000
Jackson Boulevard Subway	4,900,000
Clark Street Subway	9,000,000
Total cost street car subways	$18,400,000
Rapid Transit Subway, State Street	16,000,000
Total estimated cost all subways	$34,400,000

These estimates are all for structures only, ready for the installation of tracks and equipment.

It is interesting to note that the amount of money in the city traction fund, as paid from the proceeds of surface lines operation, is now approximately equal to the total cost of these initial subways recommended by this committee of engineers.

Supplemental Report Suggests Another Subway

In addition to the matter appearing in the report of the committee of engineers as abstracted above, a supplemental report was also presented to the local transportation committee March 27, in which reference was made to the rapid growth of the district lying east of State Street and between the Chicago River and Lincoln Park. There has been much agitation for a subway to serve this district. With regard to this, the supplemental report states that special transportation, in the form of a subway for this district, while desirable from a municipal point of view and attractive from the standpoint of ease and low cost of construction, cannot, in common with the initial subways recommended, now be justified on the basis of earnings on the capital investment required.

Should the present development continue, however, even for a short period of time, transportation for the district should be provided, and probably by means of a subway connecting the outlying districts north and south and passing along the east margin of the city and following the suggestion contained in the Traction and Subway Commission's report of 1916. This subway would extent from a portal at about Eighteenth Street and Indiana Avenue, on the south, following Indiana Avenue, to Twelfth Street, thence north in the parkway east of Michigan Avenue, under the river to St. Clair Street, and thence swinging into North Michigan Avenue, at Chicago Avenue, up the parkway east of Lake Shore Drive and under Lincoln Park, with a portal located at North Avenue. This subway would connect with the Grant Park ends of the west side subways opposite Jackson Boulevard and Washington Street, thereby providing facilities for looping or rerouting cars from all parts of the city.

Columbia Increases Service

More Cars Being Run Under Police Protection—Arbitration Refused by South Carolina Company

There has been no recurrence of violence by strikers on the lines of the Columbia Railway, Gas & Electric Company since the early part of last week. The police continue to guard each car by a detail which follows in an automobile, but the number of policemen in each automobile has now been reduced from four or five to two. By March 28 twelve cars had been put in service, beginning operations at 7 a.m. and running to 7 p.m.

Efforts by the union to get somebody to arbitrate the trouble so far have been unsuccessful. Among those suggested have been the industrial relations committee of the Chamber of Commerce and an arbitration board to be appointed under the Gerald Arbitration Act, but the company has refused to submit what it conceives as its "business affairs" to arbitration, and if an effort is made to enforce the Gerald Act the company has declared that it will test its constitutionality. In a statement issued March 25 R. Beverley Herbert, attorney for the company, said in part:

> We wish to call the attention of the public to the fact that there was no dispute with the union or our former employees about wages or the hours of work. The union accepted the wage scale and hours we offered. The dispute was as to whether or not we would submit to arbitration the question of discharging an employee whose services were not satisfactory to the company. We think any one who will consider the matter will understand that we could not employ men and let them or any one else other than the company decide whether their services were satisfactory and whether we would continue to employ them.
>
> We have nothing against the former employees and are not opposed to unions or union labor. On the other hand, we have genuine sympathy for labor and for our former employees. When they went on a strike we put the cars in the barn and let them stay there a month, hoping that the men would come back to work and we then gave them every opportunity to come back to our employment before we employed other men. We tried to make them understand our position and to see that we were in earnest. We think they have failed to understand that either we will have to operate the street railway as a business concern or cease to run the cars at all. With us it is not a question of going back to the old contract. It is a question of running the street railway company without arbitration or going out of the street railway business.

Improvements Planned for Rochester Lines

An inclusive program of track reconstruction and service improvements for 1922 for the Rochester lines of the New York State Railways was recently outlined by Charles R. Barnes, commissioner of railways. The contemplated improvements will cost about $500,000. The plan provides for the installation of cross-town service in the northern part of the city, tapping the Clifford, Portland, Hudson, Joseph, Clinton Avenue, St. Paul, Lake Avenue, Dewey Avenue and Driving Park Avenue lines. The Dewey Avenue service will be extended from Ridge Road to Stone Road. Trackless trolley cars will be used on both the cross-town lines and the Dewey Avenue extension. The Clinton Avenue north line will be extended from the present terminus to Keeler Street, a distance of 1,750 ft.

Service will be extended on the Lyell Avenue line by utilizing the tracks of the Rochester, Lockport & Buffalo Railway. Owl-car service will be furnished soon on the Park and Dewey line.

Mr. Barnes' statement says that consideration is being given to the extension of service in Chili Avenue and Culver Road sections of the city by the installation of trackless trolleys.

A terminal building and loading platform will be erected at Ontario Beach Park in time for the summer travel.

In his statement itemizing the improvements Mr. Barnes says that extensions of service in the past have not kept pace with the growth in population and area of the city. He also said that it was the consensus of opinion among street railroad men of the country that on account of the cost of track construction supplemental city service could best be furnished by buses.

Commission Demands Further Improvements

In a letter to Franklin T. Griffith, president of the Portland Railway, Light & Power Company, Portland, Ore., the Public Service Commission demands that the company expend during 1922 the sum of $500,000 in maintenance, construction and reconstruction work. The letter stated that during the hearing held in February, 1920, and preceding the issuance of an order increasing car fares there had been filed with the commission certain expenditures in the amount of $819,950 necessary to the rehabilitation of the company's trackage layout. Further, that as of Dec. 31, 1921, there had been expended upon the items set out in the exhibit the sum of $386,470, with an additional $78,000 on track reconstruction. Expenditures during 1921, with maintenance added, will bring the total expenditures on reconstruction and maintenance somewhat in excess of $520,000. The letter states that the investigation convinces the commission that it can equitably require the expenditure of a sum of not less than $500,000 on maintenance and construction in 1922.

Nashua Property Making Good Progress

The part electric railways play in the life of a community with some salient facts about this method of transportation as an industry was made the subject of an interesting and instructive talk fest recently at the Nashua, N. H. Country Club. The remarks were contributed by three well-known men in the railway industry, Edward Dana, general manager of the Boston Elevated Railway, W. H. Burke of the Stone & Webster management division, also of Boston and J. A. Queeney of the Railway Sales department of the General Electric Company, Schenectady, N. Y. Through the influence of E. W. Holst, engineer of the Nashua Street Railway, these three men were brought to Nashua.

Mr. Queeney took occasion to remark that under the two years' guidance of Mr. Holst the Nashua Street Railway had made rapid strides and that it was only a comparatively short time ago when the system was on the red ink side of the ledger. Some of the outstanding topics discussed at the recent Mid-Year Meeting of the American Electric Railway Association at Indianapolis, Ind., were referred to by Mr. Dana in his talk. He also gave some facts about the Boston Elevated Railway, commenting on its financial condition for the last year and declaring that it was on the principle that patrons of the road and not the general public should pay for the cost of their transportation, that the present board was operating reducing fare costs where practical. Mr. Burke gave some interesting statistics on the railway industry at the beginning of the inflation period and by means of a chart showed labor costs, revenues, etc. He said that the number of passengers had increased steadily on the average in recent years in a ratio of about 10 per cent.

Railway Unable to Perform Paving Work

President Wheelwright of the Virginia Railway & Power Company, Richmond, Va., has informed the Director of Public Works that owing to its serious financial condition his company will be unable to meet the franchise provision calling for an expenditure of $225,000 for paving and rebuilding of tracks. Accordingly Director Saville announced that the entire paving scheme for the year under the Roden bond issue would have to be revised.

In his letter expressing his regrets to Mr. Saville, Mr. Wheelwright said it was embarrassing for the management to have to take the position ostensibly of "laying down" since this procedure was far from its desire. In alluding to the company's financial condition he said that for the past year to Jan. 1 the company had failed to earn bond interest and taxes on the Richmond street railways by the sum of $297,057 and that for the past two months the situation had become acute. He said that the Council's failure to meet the urgent pleas of the company for relief in the matter of fares and franchises had been responsible for the railway situation in Richmond steadily growing worse.

Arbitration Board Deadlocked

No indication is forthcoming as to the prospects of a settlement of the Indiana, Columbus & Eastern traction line wage dispute by the arbitration board, which at present is deadlocked on the appointment of a third member. The line was a part of the Ohio Electric Railway before that system went into the hands of receivers. S. H. Hutchins, Columbus, Ohio, and C. W. Rich, Springfield, the two arbitrators, plan to hold a meeting soon in an effort to select the third man. Mr. Hutchins is also a member of the arbitration board which is attempting to solve the wage dispute between the company and its employees on the city lines in Lima, Ohio. The others on the Lima board are: C. A. Anderson, Lima attorney, and John Sweeney, Lima contractor. The old wage scale was 46 cents an hour. This is being continued pending settlement of the dispute. The company is proposing a reduction in the rate.

Investigation Made Into Serious Accident

An investigation is being made by Jerome Kuertz, Director of Street Railways, and officials of the Cincinnati (Ohio) Traction Company to determine the cause of an accident on one of the company's cars on March 24, which cost the life of a woman and injured nine other passengers. The accident occurred when a Clifton-Ludlow car got beyond control and slid down Clifton Avenue, one of the deepest grades in the city used for electric railway transportation, and crashed into a Vine-Burnet car.

Walter Draper, vice-president of the traction company, after viewing the scene of the accident and inspecting the car upon its arrival at the carhouse, said that the mishap was one of those things which could not be avoided, despite precautions. Both Mr. Draper and Commissioner Kuertz said that from all appearances both the motorman and conductor used every preventive to stop the car when it started on its runaway flight.

Condemns Radial Legislation

The Council of St. Catherines, Ont., unanimously indorsed a report of its special railway committee, in which hydro-radial legislation contemplated by the provincial government was condemned as prejudicial to the rights and vested interests of municipal corporations. The government was urged to take no further action toward nullifying previous hydro-radial enactments until a conference has been held between the government, the Hydro Electric Power Commission and the municipalities concerned.

News Notes

Association Formed.—An employees' association has been formed among the people employed by the Olean, Bradford & Salamanca Railway, Olean, N. Y. John Nutt, Olean, is president, assisted by an executive committee of eleven men.

Men Accept Present Scale. — Employees of the Scranton (Pa.) Railway have voted to renew their wage contract for another year. The agreement continues in effect until April 1, 1923. The company refused the men's request for an increase of 6 cents an hour.

Get Together Features Fun. — The Beaver Valley Traction Company, New Brighton, Pa., held a get-together of all employees and their families recently. In the language of the circus, the big show was at 7:30 p.m., but for late men a meeting was held at 1 p.m. At the evening gathering there were music, singing, monologues, readings, speeches, and other fun. A safety exhibit was a main feature of the evening.

Car Runs Down Hill.—The brakes of a Belt line car of the Public Service Railway failed to work on the up-grade on Newark Avenue, Jersey City, N. J., on March 28 and the car started down the hill, smashing into a loaded one-man Hudson line car. Twenty-four people suffered injuries. At the office of John F. O'Toole, assistant to the president of the Public Service Railway, it was said that it was not known just what the trouble was but that an investigation was being made.

Read "Service News."—In order to acquaint its employees with information about the company doings and other news the Savannah Electric & Power Company, Savannah, Ga., is publishing a monthly bulletin entitled *Service News*. The issues, distributed among the employees each month, contain some effective suggestions such as "Cultivate the feeling that the company wants to please its patrons," "Smilingly sell safe, satisfactory service" and "Kourtesy Kurtails Kicks."

Wages Reduced.—A reduction of 7 cents an hour in wages paid motormen was made April 1 by the Pine Bluff (Ark.) Company. Reductions will also be put into effect with all other employees of the railway department. The reduction was caused by a recent City Council ordinance requiring the company to reduce fares from 7 to 6 cents for cash fares. Motormen, who also serve as conductors, were paid 36 to 46 cents an hour. The new scale is 29 to 39 cents an hour. The motormen are on duty from ten to eleven hours each day, working seven days. This is the first reduction in wages made by the Pine Bluff company since 1918.

Financial and Corporate

Interurban to Be Sold

One of Oldest Traction Companies Is Unable to Continue Selling of Service —Cars and Track Only Assets

The stroke of midnight on March 25 tolled the passing of one of Cincinnati's oldest traction companies, the Interurban Railway & Terminal Company, with its Cincinnati (Ohio) terminal on Sycamore Street. For many years now the traction company has fought a losing fight, steadily working always with the debit side outweighing the credit side. The discontinuance of the Interurban Railway & Terminal Company follows much litigation by bondholders of the company, who won their fight to have the road closed and the property sold to the highest bidder. A month ago the State Public Utilities Commission granted a committee of bondholders authority to abandon the line. The cars and rolling stock will be placed on the market and the tracks torn up and sold for scrap. The passing of the Interurban Railway & Terminal Company also marks the disappearance of electric railway transportation between Cincinnati and New Richmond and Cincinnati and Lebanon.

When the interurban boom of the late '90s reached its zenith a company was formed in 1898 called the Cincinnati & Eastern Electric Company. It built an interurban line to New Richmond. Then in 1899 another company was formed called the Suburban Traction Company. It built a line part way to Bethel, Ohio, through Mount Washington. Still another company, the Rapid Railway, built a traction line to Lebanon, Ohio. Finally, in November, 1902, these companies consolidated as the Interurban Railway & Terminal Company and elected George R. Scrugham, president. Associated with Mr. Scrugham were W. E. Hutton, Charles H. Davis, Leo H. Brooks, deceased; George H. Worthington and others.

Two disastrous fires are part of the history of the Interurban Railway & Terminal Company. One destroyed the Sycamore Street terminal, with a loss of $100,000, and the other destroyed the carhouse at Coney Island with a loss of nearly $75,000. The company's chief asset will be its track and rolling stock.

Brooklyn Company Rejects Commission's Valuation Invitation

The Brooklyn (N. Y.) City Railroad on March 27 made public a resolution adopted by its board of directors regarding the appraisal of the valuation bureau of the New York Transit Commission. The resolution, passed at a board meeting on March 17, followed a general discussion by the directors of an outline of the appraisal presented by Vice-President H. Hobart Porter.

The directors believe that for reasons they set forth in detail they are not justified in expending the large amount of money necessary to examine and analyze the valuations referred to in the letter of the commission of Feb. 23 and to prepare the detailed criticism and objections which are invited.

Improved Conditions Continue

The Muskegon Traction & Lighting Company, Muskegon, Mich., is keeping up the good work started in January. As a result of that month's operation the company actually showed net earnings, but after interest charges a deficit remains. In February there was a balance after interest charges amounting to $32.43. For two months the electric railway has been operating without bus competition and has shown that it can meet its expenses better when the bus, as competitor, has been removed. The company carried 338,659 passengers in February. The improved business conditions on this property were referred to in the ELECTRIC RAILWAY JOURNAL, issue of March 11.

Deficit After Dividends

During 1921 the Omaha & Council Bluffs Street Railway, Omaha, Neb., carried 68,726,479 revenue passengers, as against 72,055,229 during 1920. Passengers carried on transfers: 1921, 18,907,734; 1920, 18,938,721.

The financial statements for 1921 and 1920 follow:

	1921	1920
Revenue from transportation	$4,262,852	$4,497,728
Other revenues	352,737	309,801
	$4,615,589	$4,807,529
Operating expenses	3,482,284	3,603,678
Net operating revenue	$1,133,305	$1,203,851
Taxes assignable to railway operations	437,620	427,862
Operating income	$695,685	$775,989
Plus non-operating income	38,966	29,914
Gross income	$734,651	$805,903
Total deductions from gross	637,457	637,490
Net income	$97,194	$168,414
Profit and loss adjustments	18,207	7,552
Adjusted net income	$78,986	$160,861
Preferred stock dividend requirements	200,000	20 ,000
Deficit	$121,013	$39,139

The total expenditure for additions and betterments during 1921 was $51,848, consisting mostly of costs of paving streets not previously improved and also laying heavier rails.

In its physical valuation reports now being considered by the Nebraska State Railway Commission for rate-making purposes, the company shows the following valuation totals for the system:

Four-year average, $21,740,254; 1919 reproduction, $25,126,177; present value (as of Sept. 1, 1919), $23,291,772.

Friendly Suit to Foreclose Commenced

Suit in foreclosure of a mortgage securing bonds amounting to $150,000 against the People's Traction Company, which operates the interurban line between Galesburg and Abingdon, Ill., has been filed by C. S. Harris in the Circuit Court, naming the Western Railways & Light Company, the People's Traction Company, the Galesburg Railway, Lighting & Power Company, and other companies concerned, as defendants. The suit is a friendly one, brought by the bondholders merely to protect their interest and speed up the negotiations for the exchange of securities now in progress.

The suit is brought in the name of the People's Trust & Savings Bank, Galesburg, trustee for the bondholders, two-thirds of the bondholders having made written request of the trustee to protect their interests by foreclosure of the mortgage.

All's Not Well in Radford

Electric railway service was suspended temporarily in Radford, Va., as a result of a controversy in which City Council, the Radford Water Power Company, which operates the street railway, and the jitneys are involved. Trouble began when a bus operator began carrying passengers between Radford and East Radford for 5 cents, after the railway had secured the approval of the City Council to put into effect a 7-cent fare. Accordingly the railway reduced its fare to 5 cents and the bus operator carried passengers for what they gave him. That evidently was the last straw or ride in this case as the car was put in the carhouse. It is stated that the jitney operator will be allowed to run his bus until his license expires in May.

Successor Company Organized at Lafayette

Articles of incorporation were filed with the Secretary of State on March 24 by the Lafayette (Ind.) Street Railway Company, Inc., the concern that is taking over the local lines at Lafayette, sold under foreclosure recently. The capital stock is $250,000 and Julius Berlovitz, Richard B. Sample, Charles L. Murdock, J. G. McKee and Allison E. Stuart are named as directors.

The directors have named the following officers: President, Julius Berlovitz; secretary, J. G. McKee; treasurer, Charles L. Murdock. Mr. McKee is a former traction line auditor, and was employed on the Murdock lines for several years. Mr. Murdock is the son of Charles M. Murdock, president of the First Merchants National Bank.

It was stated recently that a deed to the property recently purchased by the company will be issued April 1, and plans have already been made for the rehabilitation of the car lines. Engineers are now negotiating with various companies for rails, cars and other new equipment.

London Outlook Cheerful

Chairman of Underground Railway Group Looks Forward to Gradual Improvement in Future

In the latter part of February there were issued the directors' reports and accounts for 1921 of the London "common fund" companies. These are the Metropolitan District Railway, London Electric Railway, the City & South London Railway, the Central London Railway, and the London General Omnibus Companies. Over all the companies had a specially successful year, largely owing to increased fares, and dividends—though nothing to boast about in an absolute sense—were exceptionally high. The ordinary stock of the District Railway got a dividend of 1 per cent—the first on this stock for many years.

The gross revenue for the year of the five companies was £13,085,557. Their revenue liabilities, namely working expenses, rent, rent charges, interest on loans, debentures, guaranteed and preference stocks, and reserves for depreciation and obsolescence, amounted to £12,176,285, leaving £909,272 for the common fund, to be distributed among the companies in percentages fixed by agreements. The Metropolitan District got £109,113, the London Electric £320,552, the City & South London £54,556, the Central London £104,483 and the London General Omnibus Company £260,568.

The accompanying tables show the working results for each company.

Lord Ashfield spent an arduous day in presiding and delivering his chairman's address at each of the five meetings of the companies in the London "combine." It was no wonder that he suggested that in future there should be a joint meeting, as many of his remarks are applicable to all the companies. In addressing the shareholders of the Metropolitan District Railway he said that if it had not been for the coal strike from April to June of last year and the subsequent trade depression, the results from the increased fares in London would have reached expectations.

The volume of traffic in London was a barometer measuring the country's prosperity. Lord Ashfield set out in detail the proposals he had made to the Government last autumn for relieving unemployment by carrying out the authorized developments of the underground system, if the Government would guarantee the new capital (as provided for in the Trade Facilities Act) and if the Government would secure the General Omnibus Company against piratical competition for ten years.

Note—In consequence of the Government control of the Metropolitan District Railway in 1920, the traffic receipts and expenditures for that year are not comparable with those for the year 1921 and are omitted. In the previous year the receipts included £705,347 received as Government compensation.

Digitized by Google

As the Government declined to agree, a revised scheme had been sent in, and he hoped it would be accepted. Meantime the nature of it could not be disclosed. Expenditure on capital account of £707,000 had been incurred during the year for new rolling stock. In spite of current prices being at the maximum, it was impossible to refrain from ordering new cars, in view of the congestion of traffic. The price was 275 per cent above the pre-war price. To help to meet the cost a temporary loan of £400,000 was obtained from the company's bankers. New overhaul shops for all underground railways were being built at Acton at an estimated cost of £350,000.

Fall in Wages

In regard to the fact that a dividend (1 per cent) was being declared on the ordinary stock of the company (which very rarely receives any dividend) he said that it was practically paid out of the proceeds of the second half of the year, and arose largely from the distribution of the common fund of the associated companies having been revised as from July 1, 1921. In general, he considered the results for the year extremely satisfactory. This was the first time since 1882 that the company had declared a dividend on its ordinary stock and on that occasion the distribution was only three-sixteenths per cent. He had reason to hope that it would be possible gradually to increase the dividend in future years.

At the meeting of the London Electric Railway, Lord Ashfield, referring to the reductions in wages under the sliding scale as cost of living fell, said that the reductions in wages during 1921 meant a saving of £240,000 to the four associated railways. As for the fall in prices of materials, it occurred rather late in last year, and as the associated companies carried large stocks the benefit from the fall has hardly accrued. The average price of coal last year was 52s. 6d. per ton. For the current year to date the cost was less than 32s. 6d. per ton. The one factor which prejudiced the situation was a heavy falling off in the volume of traffic. However, the economies that could now be counted on would appear sufficient to maintain the companies in their present position, so that when the revival came, the companies should occupy a strong position.

An Unprofitable Extension

At the Central London Railway meeting Lord Ashfield said that 1921 was the first year during which the extension railway from Shepherd's Bush to Ealing had been continuously worked. Under an agreement with the Great Western Railway that company maintained the railway and worked the train service. For doing this the company received a share of the traffic receipts. This share had barely been sufficient to meet the expenses, and the results were very disappointing. The number of passengers carried during the year was about 3,200,000, while the number of passengers using the Ealing stations and the Metropolitan District Railway was more than 9,000,000. The discrepancy was due to the higher fares on the new route. The rates in vogue there were necessitated by the fact that the new railway was a part of the Great Western Railway, on which the fares were 75 per cent in advance of the pre-war rate. Negotiations were in progress for an adjustment of fares.

Bigger Tunnels Needed

At the City & South London Railway meeting, Lord Ashfield said the conditions had not been favorable for the company making a start for the reconstruction of the railway (particularly for enlarging the tunnels which are smaller than those on the other and more modern tube railways). The number of passengers for the year showed a decline of 23 per cent and the drop was more severe than in the case of any of the other railways in the group. It was hoped that an application for guarantee of additional capital by the Government under the Trade Facilities Act would be obtained. In looking to the future, he saw no reason why the position of the company should not improve.

The brief abstract just given indicates that with reviving trade and a maintenance of present fares until circumstances justify their reduction the underground companies should do fairly well.

More Rolling Stock Purchased Under Equipment Trust Plan

Putnam & Company, Hartford, Conn., are offering for subscription $171,000 of Connecticut Company equipment trust 5 per cent gold notes Series E. The trustee of the issue is the Security Trust Company, Hartford. The notes are dated April 1, 1922, and will mature in twenty semi-annual installments. They were offered at prices to yield about 5.35 per cent.

These notes are a direct obligation of the Connecticut Company under an equipment trust agreement between it and the Security Trust Company of Hartford, Conn., trustee. The title to the equipment under this agreement remains with the trustee until both principal and interest of all notes shall have been paid in full.

The total cost of the equipment is $229,000, of which 25 per cent, or $58,000 will be paid in cash. The notes therefore represent 75 per cent of the purchase price. The equipment consists of thirty-five standard 28 ft. single-truck steel safety cars with air-brakes and two 25 h.p. motors, each car having a seating capacity of thirty-two passengers, and three 40 ft. double-truck steel safety cars with air-brakes and four 25 h.p. motors, each seating fifty-two passengers. These cars are of the most modern design and construction. The double-truck safety cars are in use on the line between Torrington and Winsted, 12 miles distant. They were described in the ELECTRIC RAILWAY JOURNAL of Feb. 18, page 276.

Previous issues of the equipment notes were as follows:

Series A	Dated Oct. 15, 1915
Series B	" Sept. 15, 1916
Series C	" Jan. 15, 1920
Series D	" May 15, 1920

Of these Series A and B have been paid in full, while of Series C $45,000 has matured and been paid and of Series D $26,000 has matured and been paid.

The bankers point out that the company paid about $850,000 of these notes during the worst period of electric traction business, and that cash to meet these maturities has always been deposited with the trustee in advance of the due date. It is also explained that on July 15, 1922, there will be due from the company to the State of Connecticut about $778,000, of which $363,000 covers funded tax obligations, and $415,000 is on account of current taxes. To meet these payments the company has a cash reserve of $650,000. The balance is to be provided for during the next three months.

Financial News Notes

Loss Continues.—Filing of the regular monthly report for February of the operations of the Springfield (Ohio) Street Railway with the city manager, on March 25, reveals that the company has made no financial improvement over the month of January. A loss of $4,579 was sustained in February, as compared to a loss of $5,704 for January.

Property Sold.—Property of the Conway Street Railway, extending from Conway, Mass., to South River, on the Fitchburg line, a distance of 7 miles, operation of which ceased some time ago, has been sold to H. Jacob & Son, junk dealers, North Adams. The dealers said they would try to resell it as it stands.

Nueces Company Reorganizes.—The Nueces Railway, Corpus Christi, Tex., which owns and operates the street car lines of that city, has been organized with a capital stock of $10,000. Incorporators are R. W. Morrison, E. H. Eldridge and E. R. Kleberg. The trolley lines in Corpus Christi have not been operated since the fire destroyed the power plant several weeks ago. The power plant is being rebuilt.

Surplus of $656,226.—The West Penn Traction & Water Power Company, Pittsburgh, Pa., and its subsidiaries report gross earnings for the year ended Dec. 31, 1921, of $14,189,776, an increase of $581,827 over the earnings a year ago. The operating expenses decreased nearly $6,000. The net income increased from $1,256,495 in 1920 to $1,464,508 in 1921. After deducting preferred dividends amounting to $808,282 a surplus remained of $656,226.

Traffic and Transportation

Fares Reduced on Some Eastern Massachusetts Divisions

Fare reductions and zone extensions will go into effect on April 21 in the Lynn, Salem, Lawrence and Brockton districts of the Eastern Massachusetts Street Railway.

The trustees say that the Salem, Brockton, Lawrence and Lynn districts have been making the best financial showing during the past few months and in accordance with the service-at-cost plan under which the road is operating they are entitled to the lower fares.

In the Lawrence district, tickets will be sold at the rate of seventeen rides for 95 cents; in Salem at the rate of seventeen rides for $1, and in Lynn at the rate of nineteen rides for $1 or 5½ cents a ride.

A twelve ride $1 ticket will be issued in Methuen and other outlying towns in the Lawrence district, where the only fare now is 10 cents cash. In the Brockton district, a fourteen ride, $1 zone ticket to surrounding towns is increased to fifteen rides. The city zone ticket remains good for seventeen rides for $1.

Lower Fares Issue of Election

Immediate action for lower fares at Hartford, Conn., is among the items in the platform of the Democratic party for the municipal election that will take place on April 4. Richard J. Kinsella, Democratic nominee for Mayor, says, if elected, he will favor and insist upon a reduction of 25 per cent, or four fares for 25 cents instead of three, the present scale. The salient features of his platform are:

1. Reduce fares at once to four fares for a quarter.
2. Have Hartford division separated from state system as a unit for computing operating costs and receipts.
3. Decrease overhead by curtailing suburban trolley service during "hollow" hours of the day and night.
4. Maintain receipts in Hartford by improved service during rush hours and by increased number of passengers due to lower fares.

It is argued that the Republican administration has opposed action looking toward lower fares in Hartford. Decreasing the overhead expense, the Democratic nominee declares, would not work a hardship on the trolley system financially.

Pass Plan in Effect

The Cedar Rapids & Marion City Railway, Cedar Rapids, Iowa, has installed the monthly personal pass to give a reduced rate to regular riders. The line runs from the business district of Cedar Rapids to the suburb of Kenwood, thence to Marion City, a distance of 6 miles. A one-way cash fare is 18 cents, but books containing ten tickets are sold for $1.50. Under the pass plan a person who pays $1 a month will be entitled to ride at 10 cents per ride. Thus, if he rides twice each working day, or fifty times a month, his fare will be 12 cents instead of 18 cents. The plan went into effect on March 15.

Misunderstandings Cleared Up

Virtually all points of difference between the California State Railroad Commission and the Los Angeles Board of Public Utilities were settled on March 22 at a conference of members of the two bodies, it was announced by representatives of each, and assurances were given that closer co-operation between the commission and the board would follow.

Friendly suits, as previously requested by the Railroad Commission in a letter to the board, to test the question of jurisdiction over utilities in Los Angeles will be instituted either by the Railroad Commission or by the Board of Public Utilities, according to J. D. Kennedy of the utilities board, who stated that the conference held in the office of President Brundige of the commission "has resulted in a closer relationship and a far better understanding of our respective functions."

The first of these suits is expected to follow a decision by the Railroad Commission on a petition from the Hollywood Board of Trade asking that the Los Angeles Railway Corporation be required to extend five of its lines into the Hollywood district to compete with the Pacific Electric lines, which serve Hollywood exclusively. The Los Angeles Railway lines have a 5-cent fare and the Hollywood Board of Trade petitioned this service in face of the 10-cent fare charged by the Pacific Electric Railway, and as granted by the Railroad Commission in its decision of Dec. 24, 1921, for increased fares on the various lines of the Pacific Electric Railway.

The attorney for the Hollywood Board of Trade at the rehearing of the Pacific Electric Hollywood rate case, held on March 20, 21, 22 and 23, set forth that the commission has the authority to order the Los Angeles Railway to extend its lines into Hollywood, while opposing counsel of the Los Angeles Railway set forth certain arguments and court rulings that neither the State Railroad Commission nor Los Angeles Board of Public Utilities had the authority or legal power to order these line extensions. Ex-commissioner Edgerton and former president of the State Railroad Commission represented the Los Angeles Railway Corporation as special counsel in arguing against the petition of the Hollywood Board of Trade to the commission to order these extensions of lines.

Reduction in Round-Trip Tickets Announced

New tariffs have been filed with the Public Service Commission by the Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., providing for reduced rates to Clinton, Brazil, Paris, Sullivan and other points. When asked about the reduction, General Manager E. W. Walker said that it was the intention of the traction company to meet the desire of the people for cheaper transportation by putting into effect greatly reduced round-trip rates. He said in part:

> The company has been catering to the transportation needs of Terre Haute and vicinity for very nearly a half century; it will celebrate its fiftieth anniversary in 1926. Its stockholders have invested millions of dollars in building up a plant and equipment, and it has never expected to make any money other than by legitimately meeting the needs of the community for transportation, and doing this at a price which would stimulate the freest use of the facilities provided. Its investment is a fixed investment, and it has no opportunity during dull times to pull up stakes and move to another place.
>
> Looking back over the last few years, during which we have heard so much about the high cost of living, it will be remembered that only in the case of interurban fares has the Traction company at Terre Haute contributed to this high cost of living. These fares were increased by general order of the Public Service Commission at the time fares and charges were being increased by the federal government on the steam railroads. Its fare on the city street car lines is the same now as it was in 1866, and has never been higher.

Mr. Walker said that the reduced rates were voluntary on the part of the company and would become effective on March 28.

Railway Is Entitled to Higher Rate

H. F. Dicke, general manager of the Utah Light & Traction, Salt Lake City, Utah, in answer to a petition of Charles Anderson and others seeking a return to the old 5-cent fare schedule states that his company is entitled to higher fare and if the Anderson petition is pressed, he will solicit the commission for such fare increase. In his opinion instead of decreasing the rate of fare the company is entitled to an 8-cent cash rate with tickets selling for 7½ cents. He states that he is not asking for this rate at this time but reserves the right to file petition for such increase if the case proceeds to a hearing.

In the company's affirmative defense, additional investments are said to have raised the valuation of the company's property from the $8,468,278, fixed by the utilities commission Jan. 15, 1920, to $8,721,485 at the first of the present year. Operating costs in 1919 are said to have been $1,395,752, in 1920 $1,634,008, and in 1921, $1,747,253. At the same time the number of revenue passengers increased from 33,908,484 in 1919 to 34,710,922 in 1920 and then dropped off to 31,135,305 in 1921, while decreases are again shown for the present year of 236,257 in January, 213,019 in February and 79,660 in the first half of March. Unless a change comes, it is predicted, the company may not expect more than 30,000,000 revenue passengers for 1922.

Interstate Act Interpreted

Court Issues Temporary Injunction in Which Jurisdiction of I. C. C. Over Electric Lines Is Denied

Ordinarily the electric railway engaged in interstate commerce does not come under the jurisdiction of the Interstate Commerce Commission. In order to do so the electric railway must be operated as a part or parts of a general steam railroad system of transportation, must be engaged in the general business of transporting freight in addition to its passenger and express business, or it must be operated as part of a general steam railroad system of transportation or be engaged in the general transportation of freight. If a road is not thus engaged or being thus operated it is not within the Interstate Commerce Act nor within the jurisdiction conferred on the Interstate Commerce Commission, even though the road may be engaged in interstate passenger business.

This, in short, is the ruling just made by Circuit Judge Donahue and District Judges Killits and Westenhaver in the District Court of the United States for the Northern District of Ohio, Eastern Division, in the case of the village of Hubbard against the United States of America, the Interstate Commerce Commission and the Pennsylvania-Ohio Power & Light Company. To the court it seemed that the interpretation just mentioned was the only proper one and the effect of several amendments to the Interstate Commerce Act made since the decision in the so-called Omaha Street Railway case.

With respect to the general principles governing the matter the court says:

> The establishment of the Labor Board to settle controversies between carriers and employees, the guaranty for a limited period of a fixed return upon railroads, the grouping of railroads into classes and requiring rates to be fixed so as to allow a fair return to be earned on the property as a whole, the control assumed and exercised over the construction of new railroads, and the making of extensions and the issuance and sale of securities, are all parts of a general scheme from which all street or interurban electric railways are excluded unless possessing these characteristics.

With respect to the line of the Pennsylvania-Ohio Electric Company the court says that "plainly and admittedly the defendant railway was not operated as a part of a general system of steam railroads for transportation." After referring to the fact that the freight service of the company appeared to consist of packages and parcels and that this service was more nearly like what is called express than freight traffic, such an incidental and relatively insignificant and unimportant freight business could not be called the general transportation of freight in addition to the company's express business. The conclusion of the court was to the effect that the order of the Interstate Commerce Commission was in excess of any power and jurisdiction conferred upon it by the Interstate Commerce Act and that the order of that body assuming jurisdiction is void and without effect. In consequence the court signified that "the motion to dismiss will be denied and a preliminary injunction will be granted as prayed."

The court also ruled that in the case of the South Covington & Cincinnati Street Railway, cited by the defendant, the decision was wholly inapplicable and dealt with entirely different questions.

The Interstate Commerce Commission decided last fall that the franchise contract entered into between the predecessor of the Pennsylvania-Ohio Power & Light Company and the village of Hubbard, Ohio, fixing the rates between Youngstown and Hubbard was without effect where the rates so fixed resulted in unjust discrimination against interstate commerce. In consequence the Youngstown company was ordered by the commission to increase its rates by putting into effect upon five days notice a one-way cash fare of not less than 20 cents between Youngstown and Hubbard, and a commutation rate of not less than $5 for fifty-four rides. In the words of the commission the company was directed "to cease and desist from practicing the undue prejudice, undue preference and advantage found to exist in the relation of intrastate to interstate passenger fares." The decision of the Interstate Commerce Commission was reviewed in the ELECTRIC RAILWAY JOURNAL for Dec. 17, 1921, page 1091.

Transportation News Notes

Fares Reduced.—Fares on the lines of the Pine Bluff (Ark.) Company were reduced 1 cent on March 22, the reduction being from 7 to 6 cents for cash fares. Five-cent fares may be secured by purchasing books of fifty tickets. An effort is also being made to secure 5-cent fares for school children. This reduction came as a result of an ordinance passed at a recent meeting of the City Council.

Freight Rates Cut.—Freight rate reductions were announced on March 15 by the Cincinnati & Dayton Traction Company to Detroit and other Michigan points on the same basis as steam railroads. Officials of the traction company in announcing the reduction said that the company would make second day delivery to Detroit and about three-day delivery to other Michigan cities. This reduction, it was stated, is effective not only in Detroit, but to points on other railways.

Getting Used to Tokens.—Since the Connecticut Company, New Haven, Conn., placed tokens on sale for transportation there has been a slight increase in travel on the company's lines in the Hartford Division. Manager Scott said that an increase was expected and that a gain, though trifling, was noticeable. Those who are regular commuters on trolleys are now becoming accustomed to the purchase of tokens, although trolley men say it is surprising how many continue to pay the full 10-cent fare.

A Tower Will Guide You.—Baltimore, Md., has become a City of Towers. To expedite the traffic this new device was recently put into service at Charles Street and North Avenue. When you are to move your vehicle a green light will be flashed, and a red light will warn you to stop. There is still another guide for you—watch the amber light. It indicates that a change is to be made. The tower at Charles Street and North Avenue is equipped with a siren which is sounded on the approach of fire engines.

Rehearing Denied.—Application by the city and county of Denver for rehearing of the rate case of the receiver of the Denver (Col.) Tramway has been denied by the United States Circuit Court of Appeals. The Appellate Court on Dec. 29, 1921, rendered an order sustaining the findings of the Federal District Court, which is the authority for the collection of the present rates of fare, and upholding the contention of the receiver that the franchise under which the company is operating is not a contract in so far as the rate of fare of 5 cents stipulated therein is concerned.

Commutation Tickets Reasonable.—The Public Service Commission of Pennsylvania dismissed the complaint of the patrons of the Pittsburgh, Harmony, Butler & New Castle Company, against the rates charged by the company. The commission found from the evidence submitted that the commutation ticket rates were reasonable and not discriminatory as compared with the cash fare rates. The company has established a zone basis of fares, with a minimum charge of 6 cents for each passenger. The zone rate is an average of 2.98 cents per mile. Tickets are sold in groups of forty-four and sixty, good on any part of the line. The charges are made upon the principle that the shorter the commutation distance, the larger the rate as compared with flat fares.

Wants Jitneys Prohibited.—Electric railway service in North Little (Ark.) is threatened with discontinuance if the City Council fails to pass an ordinance prohibiting "jitneys" from running parallel with the car tracks within a distance of three blocks from the car route, and granting the company the exclusive right of operating buses on certain streets within the city limits. This is the ultimatum delivered by P. C. Warren, manager of the Inter-City Terminal Railway. He stated that the company lost $2,240 during the month of February. D. H. Cantrell, president of the Little Rock Railway & Electric Company, represented the Inter-City Terminal Company at a recent City Council meeting. The matter will be taken up later and definitely decided.

Personal Mention

Frank H. Warren, Editor

Indianian With Keen Sense of the Verities Put Into Job Fitting His Natural Talents

Two events stand out like Mars at perihelion in the life of Frank H. Warren, claim agent of the Chicago, South Bend & Northern Indiana Railway, South Bend, Ind. The most important event of his life, of course, occurred on Jan. 8, 1878, when he was introduced to the world about 20 miles east of the Indianapolis Street Railway. The next important event came almost forty-four years later to the day, when Mr. Warren received a check from the ELECTRIC RAILWAY JOURNAL for an article on salesmanship. The first event is of course a little hazy in Mr. Warren's mind, but he is dead sure that his celebration of the second event completely out-classed that of the first. In comparison with these two peaks, everything that happened in between sinks into insignificance.

FROM MAIL CLERK TO EDITOR

This is Mr. Warren's own estimate. Another event took place in his career, however, which others are inclined to think stands second only to the memorable event of 1878. It occurred a few days ago when Mr. Warren had thrust upon him the editorship of the *Safety Valve*, a real magazine for the employees of the company, the first issue dated February, 1922. Ever since 1878 Mr. Warren has been headed editorward, but he didn't realize it until R. R. Smith, vice-president and general manager of the company, and other officers broke the news to him that he had been appointed editor of the company's new house organ.

It is said that all good men and true have either taught school or sold books. Mr. Warren confesses to having done both. In the course of that work he took a few vacations at normal schools and a university, along with some outside efforts, and finally succeeded in persuading Indiana University to give him two years credits. His education ended right there. He then took a correspondence course in which he learned about all the railroads in the world, later passed the examination for railway mail clerk, and went to work.

AN EXPERT ON NAMES

After learning the names of all post offices in that small section of the country west of the Alleghanies, Mr. Warren looked around for more worlds to conquer and seized on law as the most helpless victim. It took him just one year in a law office to master that subject, and then he became interested in claim work through an accident in the family. To Mr. Warren it looked like a pretty soft job. Throwing all possible safeguards about his effort to get a job, Mr. Warren went to Elmer Slick of the Union Traction Company of Indiana and suggested to him that he would be a winner in Mr. Slick's department. This was slick work, of course, but after slinging mail for Uncle Sam all day and at the same time doing odd jobs for Elmer, Mr. Warren abandoned Uncle Sam to his fate in order formally to hook up with the Indiana Union. He put in about five years with that company as assistant claim agent, and then spent about a year with the Interstate Public Service Company as safety agent. He then took a hand at selling, but what he really learned there was the wonderful stabilizing force of a salary. Then, Mr. Warren landed in the New York office of the Globe Indemnity Corporation and spent three months inquiring his way about in the Bronx and Brooklyn. It was about this time that Mr. Smith, general manager of the South Bend line, rescued Mr. Warren from his almost aimless wanderings and took him back to his Indiana home among the cornfields.

Claus Spreckels, New Manager at San Diego, Reviews Plans

Successor to Mr. Clayton at San Diego Not in Sympathy With California Association in Opposing Publication of "Bus Transportation"—Prepared to Use Buses in San Diego

CLAUS SPRECKELS, the new general manager of the San Diego (Cal.) Electric Railway, chosen at the last annual meeting of the company, "grew up in the business," it might be said, as all of his business life has been spent in the employ of the company. He began service at the age of twenty years as a bookkeeper, in 1911 was elected secretary and treasurer of the company, and the next upward step made him general manager. He has succeeded William Clayton, who had been managing director of the company for twenty-one years.

Mr. Spreckels was born in San Francisco in 1888, and received his education in the public schools of that city. He is the son of John D. Spreckels, president of the San Diego Electric Railway and of the Arizona & San Diego Railway. Claus Spreckels looks on things in a practical light, and hence refused a chance for a college education and started work for the electric railway instead, so that he could "learn the business from the ground up."

LEARNING FROM THE GROUND UP

"I couldn't see where a knowledge of the classics would help me run the electric railway," he said, "and that is what I wanted most to do. Practical experience looked to me like a more sensible way to attain my object, so I got on the payroll and worked up, acquiring such technical knowledge as I needed by my own efforts."

Mr. Spreckels said there would be no radical change of policy in the company due to his selection as manager. His aim will be to give the best possible service with the revenue provided, but to eliminate lines that do not pay their way and substitute less costly service. In this connection he expressed a strong liking for the motor bus, or "motor street car," as he prefers to call it.

"I think the motor street car is bound to develop into the logical solution of the transportation problem for districts where the traffic is not heavy enough to warrant building a trolley line," he said. "And as far as San Diego is concerned, we intend to meet all the needs for transportation. We are here to furnish transportation and we will do it.

"BUS TRANSPORTATION" MEETS REAL NEED

"And while on that subject, I want to say that I am not in sympathy with the position of the California association in opposing publication of BUS TRANSPORTATION by the McGraw-Hill Company. I think the new publication meets a need and furnishes transportation men all the latest developments in this latest means of transportation."

The new general manager got right into the middle of things when he took charge of the affairs of the company, and one of the first things he did was to announce a plan whereby the Adams Avenue line would be discontinued and replaced by a bus line. The residence suburbs of Normal Heights and Kensington Park, which are outside the city, are served by the Adams Avenue line, which was also within the city limits. The City Council gave approval to the plan subject to a satisfactory arrangement of details. However, residents of the two suburbs have entered vigorous protest against discontinuance of the electric trolley, and plans for the bus service have been temporarily halted to give the residents time to see if they can work out a plan they have proposed.

CITIZENS MUST PAY FOR PAVING

The company has agreed to consider a proposal to retain the trolley line on condition that residents relieve the company of all paving costs and to supply enough funds to the company to pay half of the cost of rebuilding the Adams Avenue line. This is esti-

Digitized by Google

mated at $190,000, and the paving, it is estimated, will cost $70,000. Thus it will be necessary for those wishing to retain the trolley service to raise $165,000. It is proposed to issue stock in the railway company to the subscribers to the fund for rehabilitating the line.

Citizens active in the movement to retain street car service have estimated that between $5,000,000 and $6,000,000 is represented in the real estate investments dependent on the Adams Avenue line for transporation, and assert they can well afford to advance this sum rather than allow the company to tear up its tracks and put on motor buses.

The Adams Avenue line has a total of 2.35 miles. The present roadbed and track is in such bad shape that repairs are useless, owing to the nature of the ground, and reconstruction is imperative if cars are to continue in operation. Reconstruction, if undertaken, will be of the highest type track, with twin steel ties imbedded in concrete, the same as was used in reconstructing the Broadway line downtown a few months ago. Manager Spreckels stated that this type of work would be used for all reconstruction henceforth in San Diego.

A citizens' transportation commission, appointed by Mayor John Bacon shortly after his election last fall, and consisting of Stephen Bjornson, chairman; H. F. Worth, secretary, and James H. App, in a preliminary report to the City Council recommended that the company be allowed to substitute motor buses operating on Madison Avenue for the Adams Avenue line, and the City Council has given tentative consent.

Bus Service May Be Started

Unless an agreement is reached with the citizens who are endeavoring to retain the trolley car service, Manager Spreckels announces, the bus service will be instituted. A bus has already been designed for the purpose, following the plans of Manager Spreckels, and a model of the car has been run over the proposed route. On the trial trip the full length of the Adams Avenue line was made in 12 minutes, including ten stops for discharging and receiving passengers. A 20-minute headway is maintained on the trolley line.

Other officers elected at the annual meeting of the San Diego Electric Railway Company were: John D. Spreckels, president; William Clayton, vice-president; Fred Whitehead, secretary; Read G. Dilworth, treasurer.

The same set of officers also was elected at the same time to occupy the same positions respectively in the Point Loma Electric Railway Company and the San Diego & Colorado Ferries Company.

William Clayton, retiring as managing head of the San Diego Electric Railway Company after twenty-one years of service, retired from the management in order to be relieved of some of the active work, it was stated at his office. He recently celebrated his sixty-third birthday and feels he is entitled to a rest. Besides his duties as vice-president of the San Diego Electric Railway Company, Mr. Clayton retains executive control over some other of the Spreckels interests in San Diego, so has enough to do to keep him comfortably occupied. Claus Spreckels was his natural successor in the executive chair, as the young man will some day be called on to look after all of his father's large interests, and the management of the electric railway was considered the logical starting point.

Mr. Clayton is rather proud of his record of twenty-one years as executive of the San Diego Electric Railway with never a strike nor labor trouble of any kind, nor of any serious friction with the San Diego public.

Major Smith to Assist President

On the double quick Major Earl H. Smith has marched into two important executive positions. Though he is just

E. H. SMITH

forty-two and thus scarcely old enough to have more than handled one big job, Major Smith has mastered one and is well started on his second. For Major Smith is not only editor of the Fairmont *Times*, Fairmont, W. Va., a paper which he founded, but he is now tackling the job of acting as assistant to the president of the Monongahela Power & Railway Company. He will direct the public relations of the company, and have charge of publicity.

Though his new position is somewhat removed from his previous work, in reality Major Smith has simply exchanged the game of marbles for the game of discovering the public, for he has known the men who promoted the traction company since they hooked rides, cookies and holidays together.

Since leaving college Mr. Smith has spent most of his life in the newspaper game, and some time ago founded the Fairmont *Times*. He served in France during the European War, and upon his return assisted President Alexander in an informal way. He now becomes formally associated with the company.

Obituary

E. H. Ives

Edward H. Ives, assistant general superintendent of the Detroit (Mich.) United Railway, died on March 19 as a result of injuries received when an interurban train of the Detroit United Company struck the automobile which he was driving. His wife, three children and a friend were also killed.

Mr. Ives, with his family, was on the way to Capac, when the car skidded on the ice-covered highway a mile south of Rochester, Mich., directly in front of the interurban train. One daughter jumped from the machine and was uninjured. These facts were ascertained since the publication of the item about Mr. Ives in the issue of last week.

Mr. Ives had been connected with the Detroit United Railway for twenty-six years. He had worked up to his position of assistant general superintendent from carhouse boy. He was promoted to the office of assistant division superintendent and superintendent, and before his last position was assistant schedule chief and later second assistant general superintendent.

Mr. Ives has been popular with the company and with city officials. The city hoped to keep him when the Municipal Railway and the Detroit United lines were combined.

John A. Hurley, retired manufacturer of Bridgeport, Conn., died at his home in that city March 20. Mr. Hurley was born in New Haven, April 30, 1854. When young he removed to Meriden, Conn., where he became vice-president of the Connecticut Breweries Company. While in Meriden he built the electric railway from that city to Lake Compounce, known as the Meriden, Southington & Lake Compounce Street Railway. Mr. Hurley was later associated with the Hurwood Manufacturing Company, and more recently was engaged in the insurance business.

Walter G. Oakman, noted financier and railroad builder, died on March 18 in New York, N. Y. He was in his seventy-seventh year. Mr. Oakman was best known to New Yorkers as president of the Hudson Companies, which financed the tunnel system that links New York City with New Jersey. He had also been interested in the Interborough and the Brooklyn Rapid Transit companies. He was graduated from the University of Pennsylvania in 1864, leaving college to join the Union armies and fight in the closing months of the Civil War. Later he entered the railway field, and became division superintendent of the Delaware, Lackawanna & Western Railroad. He was a director of the Brooklyn Rapid Transit Company, Brooklyn Heights Railroad, Hudson & Manhattan Railroad, New York Municipal Railway and many other transit and banking companies.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Industrial Machinery Division Formed

The Bureau of Foreign & Domestic Commerce, Washington, D. C., announces the formation of an Industrial Machinery Division to provide American manufacturers of machinery with assistance from the government. A pamphlet has been issued describing the functions and aims of the division, together with the service which is available.

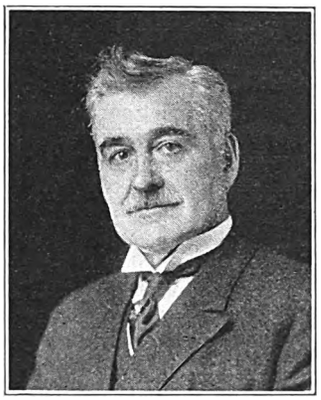
William J. Clark Honored

William J. Clark, pioneer in the commercial development of electric railways in the United States and a member of the staff of the General Electric Company for thirty-four years, has been appointed advisory manager of the G. E. railway department. During his connection with the company, he has been manager of both its railway and foreign departments, managing director of the British Thomson-Houston Electric Company, manager of the Cincinnati office and manager of the London office of the General Electric, as well as holding other positions of importance.

Mr. Clark, who was born in Derby, Conn., in 1854, was instrumental in obtaining the legislative charter authorizing the construction of the first electric railway in the world intended for freight traffic. This was at Derby and Ansonia, Conn. In 1888, he joined the Thomson-Houston Company, of Lynn, Mass., and induced that company to purchase the Van Depoele electric railway patents, which from a patent standpoint were essential to the fullest possible development of that industry. Later he played an important part in the commercial exploitation of these patents as well as the series parallel control, Sprague's multiple-unit train control, Curtis' steam turbine and other inventions. In 1896, at Milwaukee, Mr. Clark made the first, in this country, of what is now termed "physical valuation" of a large electric public utility.

In 1908 he was expert on Cuban affairs for the War Department. In 1906 and 1907 he was the chairman of the ways and means committee of the National Civic Federation, in which connection he financed the extensive investigation of municipal ownership conducted by the federation in this country and in Europe; and he was a member of the commission which made the investigation. He was also connected with the Republican national committee in the years 1880, 1884, 1896, 1904.

Mr. Clark is a member of all the important electrical and railway engineering societies in the country. He makes his headquarters at the New York office of the General Electric Company.



WILLIAM J. CLARK

The duties of his new position, as indicated by the title, will be entirely advisory.

Foreign Trade Convention in Philadelphia

Ways of developing foreign markets for American goods are the concrete problems to be discussed at the Ninth National Foreign Trade Convention in Philadelphia, May 10, 11 and 12, when the best business brains and experience of the nation will concentrate on these questions.

The federal government will be represented through the Department of Commerce. Whether Secretary Hoover will be present is uncertain, but the Department will have a large number of its best executives and experts at the convention. Many of these will come direct from their posts abroad and thus will be able to give up-to-the-minute and first-hand information on foreign trade matters.

The big problem before the convention is how to sell abroad the estimated 20 per cent surplus of American production over domestic consumption. One suggested means is the incorporation in all foreign loans hereafter negotiated in this country of a condition that all or a large part of the proceeds be spent here for American goods. Another means of financing foreign trade that will be stressed is the employment of the gold surplus in the United States.

One general session will be devoted to taxation and currency questions. Shipping matters will be taken up at another, and the tariff and exchange at a third.

How Boston Will Spend Her Four Million

As was mentioned in the March 4 issue of the ELECTRIC RAILWAY JOURNAL the Boston Elevated Railway's 1922 budget will amount to approximately $4,000,000. The following details or the major items of expenditure from this budget are of interest:

For power station equipment	$1,000,000
For shops at Everett and Forest Hills	1,000,000
For new cars	1,100,000
For improved signal system	200,000
For Lechmere Square terminal	100,000
For new lobby building at Malden	50,000
For tools, sprinkler systems and miscellaneous equipment	150,000

ELECTRIC RAILWAY MATERIAL PRICES—MARCH 28, 1922

Metals—New York

Copper, electrolytic, cents per lb	12.75
Lead, cents per lb	4.75
Nickel, cents per lb	41.00
Zinc, cents per lb	4.99
Tin, Straits, cents per lb	29.125
Aluminum, 98 to 99 per cent, cents per lb	19.00
Babbitt metal, warehouse, cents per lb.:	
Best grade	32.00
Commercial	16.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.57½
Somerset mine run, Boston	1.87
Pittsburgh mine run, Pittsburgh	1.85
Franklin, Ill., screenings, Chicago	2.00
Central, Ill., screenings, Chicago	1.87
Kansas Screenings, Kansas City	2.50

Track Materials—Pittsburgh

Standard Bessemer steel rails, gross ton	$40.00
Standard open hearth rails, gross ton	$40.00
Railroad spikes, drive, Pittsburgh base, cents per lb	2.05
Tie plates (flat type), cents per lb	1.75
Angle bars, cents per lb	2.40
Rail bolts and nuts, Pittsburgh base, cents, lb.	3.87½
Steel bars, cents per lb	1.45
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	1.35

Hardware—Pittsburgh

Wire nails, cents per lb	2.40
Sheet iron, (24 gage), cents per lb	3.72½
Sheet iron, galvanized, (24 gage), cents per lb	4.42½
Galvanized barbed wire, cents per lb	3.05
Galvanized wire, ordinary, cents per lb	2.75

Waste—New York

Waste, wool, cents per lb	13.00
Waste, cotton, (100 lb. bale), cents per lb.:	
White	10.00
Colored	9.00

Paints, Putty and Glass—New York

Linseed oil, (5 bbl. lots), cents per gal	87.00
White lead, (100 lb. keg), cents per lb	12.25
Turpentine, (bbl. lots), cents per gal	87.00
Car window glass, (single strength), first three brackets, A quality, discount*	85.5%
Car window glass, (single strength), first three brackets, B quality, discount*	86.5%
Car window glass, (double strength, all sizes, A quality), discount*	85.0%
Putty, 5 lb. tins, cents per lb	5.50

*These prices are f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb	14.12½
Rubber-covered wire, cents per lb	5.90
Weatherproof wire base, cents per lb	15.50

Paving Materials

Paving stone, granite, 4 x 8 x 4, f.o.b. Chicago, dressed, per sq.yd	$3.35
Common, per sq.yd	3.00
Wood block paving 3½, 16 treatment, N. Y., per sq.yd	2.17
Paving brick, 3½ x 8½ x 4, N. Y. per 1,000 in carload lots	49.50
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd	1.75
Cement, Chicago consumers net prices, without bags	1.94
Gravel, ¾-in., cu.yd., N. Y.	1.75
Sand, cu.yd., N. Y.	1.00

Old Metals—New York

Heavy copper, cents per lb	9.37½
Light copper, cents per lb	8.37½
Heavy brass, cents per lb	5.25
Zinc, old scrap, cents per lb	2.37½
Yellow brass, cents per lb (heavy)	5.25
Lead, heavy, cents per lb	3.81
Steel car axles, Chicago, net ton	$13.25
Old car wheels, Chicago, gross ton	16.50
Rails (short), Chicago, gross ton	13.75
Rails (relaying), Chicago, gross ton	13.75
Machine turnings, Chicago, net ton	5.25

Coal Prices Decrease on Eve of Strike

The eve of the coal strike has been marked by a further softening of the market. Commercial consumers of coal have turned a deaf ear to the quotations made, while railroads and public utilities, which have been the most active takers, are going out of the market as their stocking programs are completed.

Heavy production in the face of this apathetic demand make lower prices inevitable. *Coal Age* index of spot bituminous prices stands at 170 on March 27, as compared with 173 on March 20. Domestic demand has almost disappeared and only the diminishing output of the resultant sizes kept steam prices from slipping to lower levels in sections where bituminous is used for household purposes.

The industrial consumer had several motives for withdrawing, temporarily at least, from the market. Present consumption rates are so low that reserve stocks are almost topheavy; indications that an announcement of cuts in freight rates will soon be made and the persistent belief that non-union fields will be able to supply fuel needs above existing stocks are the main reasons. No one wants to be caught after the strike with a stock of coal on hand that cost more than its replacement value. That the non-union supply may be adequate is being shown by the increasing desire of those operators to take on forward commitments, and dull times are surely ahead for the coal man unless the present suspension is sufficiently prolonged to enable consumers to work off the reserve supplies.

Westinghouse Electric Company Announces Personnel Changes

Several changes in personnel have been announced by the Westinghouse Electric & Manufacturing Company, among them being transfers of various managers in district offices.

R. L. Rathbone, branch manager of the Cleveland office, will take up special duties in connection with merchandising matters, with headquarters in Cleveland. J. Andrews, Jr., manager of the industrial division, Pittsburgh office, has been appointed manager of the Cleveland office and C. D. Taylor succeeds Mr. Andrews in the Pittsburgh office. R. Seybold has been appointed manager of price statistics and he will act as secretary of the domestic sales committee, among other duties, and will assist W. S. Rugg, assistant to the vice-president in general duties connected with the vice-president's office. W. R. Keagy has been appointed office manager of the Cincinnati office and J. R. Deering office manager of the Los Angeles office. H. S. Walker succeeds M. E. Lanning as promotion man in the Denver office and I. G. Cline takes up the promotion work vacated by R. A. O'Reilly in the Chicago office. K. L. Graham succeeds to the post vacated by H. C. Hopkins as promotion man in the San Francisco office.

Track and Roadway

Portland & Oregon City Railway, Portland, Ore., will extend its line 9 miles from Carver, Clackamas County, to Viola on Clear Creek. Proposed work will cost $90,000.

New York State Railways, Rochester Lines, is planning to reconstruct about 5 miles of single track in Rochester during 1922. This will require new rails, track and pavenment.

Fresno (Cal.) Traction Company has under consideration improvements and extensions of its lines requiring a total estimated outlay of $150,000. Plans have not been revealed.

The Public Service Railway, Newark, N. J., is installing pilot lights on all single-track lines with turnouts on its southern division where one-man cars are operated. This gives the operator the advantage of being able to look straight ahead.

San Francisco-Oakland Terminal Railways, Oakland, Cal., has announced that it will begin work immediately on the double tracking on Fourteenth Avenue between East Twenty-first and East Twenty-second Streets. A switch will be installed to improve service on the Hopkins Street lines. The double tracking will cost approximately $8,500.

Washington Railway & Electric Company, Washington, D. C., expects to extend its Eleventh Street and Lincoln Park lines. The company, according to present plans, will build the Eleventh Street line from the terminal at Eleventh Avenue and Monroe Streets, N. W., to Spring Road, out Kansas Avenue, and connect with the Georgia Avenue line. Overhead trolley construction will be used. The total cost will approximate $107,940. The Lincoln Park extension will include work on East Capitol Street and will cost about $97,250.

Power Houses, Shops and Buildings

Athens Railway & Electric Company, Athens, Ga., will purchase within a few days two 200-amp, 2,300-volt, single-phase regulators of the induction type, self-contained.

Boston (Mass.) Elevated Railway has asked for bids on two underfeed stokers and clinker grinders and the erecting of these under two 1825-hp. B. & W. boilers at the South Boston power station.

Cumberland County Power & Light Company, Portland, Me., has started work on its new $1,000,000 power plant at Knightville. When completed the plant will add 10,000 kw. to company's facilities. The Foundation Company of New York has charge of the construction work.

Rochester and Syracuse Railroad has bought one automatic control equipment for the Macedon substation. This station has two 400-kw. rotary converters, and a change-over switch provides so that either converter can be thrown on the automatic control equipment as desired. The hand control equipment to be removed from the Macedon substation will be used at two other locations.

Professional Note

Union Investment & Contracting Company announces the opening of offices at 7 Dey Street, New York, and the continuance of its business in association with the T. A. Gillespie Company, contractors, and with the Wood Hulse Yates Company, Inc., engineers. The company is prepared to execute for clients investigations, reports and appraisals and to undertake the design, construction, financing and management of industrial and public utility enterprises and other engineering projects. The officers of the company are T. A. Gillespie, chairman of board; F. A. Yates, president; B. F. Wood, vice-president; W. S. Hulse, vice-president; T. H. Gillespie, vice-president and treasurer, and F. J. Nash, secretary.

Trade Notes

Service Motor Truck Company, Wabash, Ind., will supply the Greater Winnipeg Water District Railroad with eleven motor rail buses, at a cost of $176,000.

Irvington Varnish & Insulator Company, Irvington, N. J., announces a change in the ownership of the common stock of the company and the election of a new board of directors, consisting of William F. Hoffmann, Arthur E. Jones, Andrew Young, Carl Egner and D. Frederick Burnett.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has received orders from the Commonwealth Edison Company, Chicago, for three 12,000-amp., 60-cycle booster converters with transformer equipment, and one 16,000-amp., 25-cycle booster converter also with transformer equipment. The company also reports an order from the Consolidated Gas, Electric Light & Power Company of Baltimore, Md., for one 16,000-amp., 25-cycle booster converter with transformer equipment.

New Advertising Literature

The Truscon Laboratories, Detroit, Mich., have just issued a second edition of a thirty-two page booklet entitled "Science and Practice of Integral Waterproofing." The first fifteen pages are devoted to explaining why concrete requires waterproofing, and following this are specifications for various methods recommended. There is also a chapter devoted to the practical application of waterproofed cement plaster coat. This publication is being distributed free to those interested.

A Million Dollar Idea

ANTOINETTE FUNK presented an idea at the Mid-year Dinner that is worth a million to the industry. In connection with her "Bond in Every Home" slogan, she suggested that a special appeal be made to the women in selling the stocks of the companies on the customer ownership plan. The women are usually the frugal members of the family. They know how to accumulate a substantial bank account (possibly kept in the "first national bank") through the process of building it up by small additions. Most every wife has a little tucked away somewhere on which she is getting only 3 per cent or no interest at all. How strong would be the appeal to her, then, to find she could just as well be receiving 6, 7 or 8 per cent on her savings with safety. Undoubtedly there have already been many women among the purchasers of utilities securities. These have responded to the general sales activities and advertising. But it is believed that by putting forth a sales campaign primarily directed to the women, companies would find this a source of adding many names to the list of stockholders and securing many thousands of dollars for expansion of the business. Mrs. Funk presented the industry with a real financing idea.

Better Selling Will Help the Railways

REFLECTIONS of increased buying and of renewed activity in physical property maintenance were mentioned last week as appearing in increasing numbers in the columns of this paper. The editors are not anticipating any large amount of new mileage, but this is not an essential to a good year for those serving the field. With finances now permitting, a very substantial betterment program is under way and it is certain to mount up to considerable business because of the deferred work that must be taken care of and because the present competitive era is forcing the replacement of old equipment with new, modern, more economical units and the addition of more facilities, in order to improve service. It is becoming realized with increasing force that, with modern equipment and plenty of it so that the service provided can be first class, the electric railways have nothing to fear from competition.

But better selling means not only getting business for the firm. The salesmen owe it to the railways as well as to their firms to make certain that executives have full information about new and better equipment. Railway men are not the kind who seek out the salesman and urge him to take their money. They have to be sold and sold hard, perhaps several times over. They take certain pride in being hard to convince and, with many problems pressing, they are willing to get rid of a salesman quickly if he "dies" easy. What is needed is some real selling, a reconsecration to good, hard, persistent, intelligent work on the part of the salesmen. For, sad to say, not all railway executives, either, are alert to the new service demands that are upon them, and some good, strong selling may rouse them to their responsibilities and save the day for them as well as the salesmen. Let's have less of salesmen playing with salesmen and more of salesmen working (and playing) with railway men.

Every One Would Lose if the Lease Was Broken

THE present deadlock in the New York transit situation is one which peculiarly calls for a give-and-take attitude on the part of all parties concerned. It has arisen through the Manhattan lease which was executed in 1903 and, unless changed, is to continue until 2874. By its terms the Interborough agreed to pay taxes and all interest on the Manhattan Company's bonds as well as 7 per cent on its outstanding stock and $35,000 annually for organization expenses.

As drafted, the lease was intended to be made as strong as possible, and declares "no reduction of the guaranteed annual dividend rental or in the term of years shall be made without the unanimous consent of the shareholders of record of the lessor"—the Manhattan Company. In other words, the lease is practically a lease to the Interborough by each individual stockholder of his proportion of the property of the company and not a lease by the company as a whole.

Obviously, it is going to be very difficult to get the consent of every stockholder. Hence, the simplest legal way of vacating the lease would seem to be for the Interborough to go into the hands of a receiver and let the receiver void the contract. But this would also be a very serious matter for all concerned; that is to say, not only for the Interborough security holders, particularly the stockholders, but also for the New York Transit Commission, the community at large and the security holders of the Manhattan Railway.

Receiverships are notoriously expensive, so that such action would not be welcomed by the Interborough security holders. The commission would find legal delays acting as a brake to the progress of its unification plan, which it hopes to get finished this summer, and it would have still another large company to bring into line. The public would not only find the present chaotic conditions longer continued, but it might lose the use of some of the extensions built by the Interborough Company for the Manhattan Company, except at an additional fare. Finally, it is hard to see how the Manhattan Company could profit by such a change. It might gain some property or the right to buy that property at a low price from the receiver of the Interborough, and under its original franchise it might be more free to charge a higher fare than at present. On the other hand, besides losing its guarantee, it would have to build up an operating organization, and its operating expenses would naturally be much more than at present. From a transportation and engineering

Digitized by Google

standpoint, the subway and elevated systems logically should be operated by the same company.

The situation, therefore, presents the rather unusual aspect of one in which each of the four principal parties to it have considerable to lose and nothing to gain by a receivership. In these circumstances it would seem as if they ought to get together. The duty of doing so is directly up to each so far as each can help.

A Catalyser Is Badly Needed

IN HIS address to the New England Street Railway Club last week E. Mark Sullivan, corporation counsel of Boston, said that the public is generous and is, eventually, right in its opinion or judgment. He also made some complimentary remarks about the management of the Boston Elevated, thus admitting that public utility managements have a speck of generosity, human understanding and ability to work with the public. But what E. Mark did not point out is that frequently one side or both need speeding up in that action which tends ultimately to complete and sympathetic understanding so that "service" may go forward. Too often the conditions are such as to demand a catalytic agent. For example, New York and Chicago.

A catalyser—for those who may have mislaid their chemistries—is a third chemical or agent which, when present with two other chemicals, hastens the chemical action which would eventually take place between the two, though not being a party to the actual affair itself.

In the issue of March 11, in the Publicity Department, there was an example of a catalyser at work. "Verily I Say Unto Thee," by the Little Rock minister, shows one way to expedite the formation of that "eventual" generous and correct public opinion. There are others. The public and the utility managements are, in every community, developing an understanding. But if the public good is to be served, expedition of that understanding is necessary.

To take a text from the Corporation Counsel of Boston and a sermon from a Little Rock minister and apply the result to Chicago and New York may seem far fetched. But the idea appeals as a good one. Surely a good, strong catalyser is necessary in the latter city if not in both.

Deferring Maintenance Expenditure Is Not Saving Money

DURING the past few years transportation companies have kept down operating expenses by all means within their power. They simply had to do it. One result was to enforce economies and efficiency in a manner that would have been impossible in more prosperous times. This is a real gain, for the habits of thrift formed under adverse circumstances will persist even after times become easier. But along with the more economical operation has gone a paring down of maintenance expenditure which is not economical; on the contrary, it is extravagance, for it is impairing the value of the properties.

Some of the well-known steam roads are conspicuous for the way in which valuable physical property is being allowed to run down through the régime of "economy" which is now the rule. These roads are conspicuous because they are so large, but many smaller steam roads and many electric roads are following the same procedure. It is easier to reduce operating expenses in this way than any other, hence the popularity of the method. The results, however, will prove most unfortunate in the long run because deterioration in one part of a property reacts on all other parts. And it is difficult to convince the public of the improving quality of service when the same public sees the instruments of that service becoming less effective from month to month.

Retrenchment in maintenance expenditure may have been necessary, drastic retrenchment in some cases. In extreme cases some properties may have to depreciate further. But the fact that the property is running down should be faced frankly. The procedure is not saving money, in spite of a possible presumption that extra wear can be had surreptitiously, so to speak, from track, overhead, power plant or rolling stock, without any resulting ill effects. Maintenance, if considered over a period of years, is much like the respiration or blood circulation in the human body—cessation spells dissolution.

More Reasons Why Railways Should Be Relieved of Paving Costs

MUCH has been said about the injustice of making an electric railway pay for the maintenance of the paving which is around its tracks but which it does not use simply because the horse railway, of which it is the successor, used to wear out the paving. Not as much has been said about the different character of paving required and its greater cost now as compared with the kind which the horse railways used to lay between its tracks forty years ago. Nevertheless, this imposes about as serious an injustice on the railway as does the fact that a pavement at all has to be maintained. This point is brought out very clearly in a paper presented recently before a real estate association in San Francisco by W. V. Hill, manager California Electric Railway Association, and published elsewhere in this issue.

From another standpoint also the old requirement for the electric railway to bear the cost of a considerable portion of the paving has become obsolete in some sections of the country.

There are many communities in which the method of paying for pavement improvements has changed. Whereas in early days all street paving was paid for by the city, now the abutting property owners pay for the paving. Under the former method, still in force in many cities, the benefit from the railway's paying for part of the paving extended to every taxpayer because it reduced the tax levy of the city. But under the latter method, where the paving is paid for entirely by the property owners, and there is no participation by the city, it is no longer a provision for the benefit of the entire community. Instead of being a provision in the interest of all taxpayers it has changed into a discrimination in favor of that limited number of taxpayers who own property along the line of the railway as against the great mass who live off the line and are required to pay the entire paving cost in front of their property.

In addition, then, to the usual reasons for relief from paving tax, those railways in communities where paving is paid for by abutting property owners have a forceful argument for mitigation of their burden which they should be sure to capitalize upon.

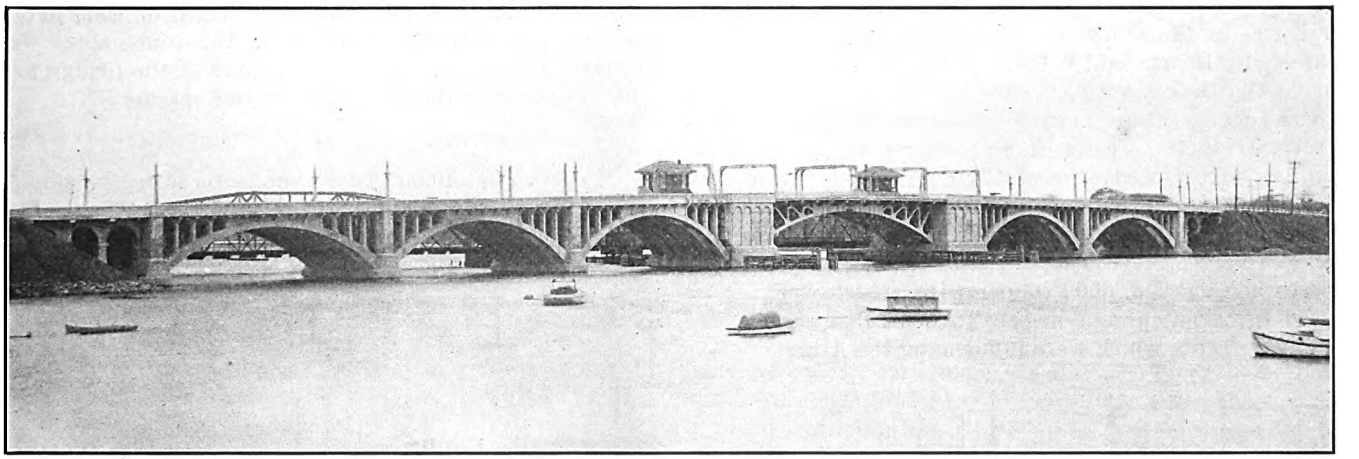
Track and Wiring on Large Bridge

The Connecticut Company Has Recently Completed Interesting Track and Overhead Construction on the New "Washington" Bridge, Spanning the Housatonic River Near Stratford—A Number of Novel Features Are Introduced



THE OVERHEAD WIRE AND TRACK CONSTRUCTION ON THIS NEW BRIDGE ACROSS THE HOUSATONIC RIVER HAS JUST BEEN COMPLETED BY THE CONNECTICUT COMPANY

DURING the seventeenth and eighteenth centuries travelers on the Boston Post Road between Bridgeport and New Haven had to use a ferry to cross the Housatonic River, which at the point where the Post Road crosses the river is about half a mile wide. By the beginning of the nineteenth century, however, the authorities decided a bridge was necessary, and one was built in 1802. Unlike most bridges of that time, it was an uncovered structure, very low, and during perigee or other unusual high tides it was frequently under water. In 1806 there was a big ice flow on the river and the bridge went out into Long Island Sound with the ice.

At that time a popular way by which the authorities provided funds for needed public improvements was to conduct a lottery. The plan was followed to raise the funds in this case, and with the money thus obtained a new bridge was built about 1808. After sixty years of service, this bridge collapsed in July, 1868. In 1892 a new bridge, the third in the series, was again necessary, and it was erected at a cost of $88,500. This bridge served until the new Washington bridge was ready in November, 1921.

In 1897 the Milford Street Railway received permission to cross the bridge, although it was not wide. The original bridge was made narrow, it is said, through political influence because the steam railroad interests feared trolley competition. There was even no footpath on the bridge until twenty years after it was built.

It was thought in 1892 that the bridge then built was heavy enough to stand the strain of highway travel for years to come, but the traffic on this main highway route between New York and New England has been so increasingly heavy during these twenty years that even as early as 1913 there was much agitation in favor of a new bridge.

Work on the new bridge was started in March, 1920. As will be noticed in the engraving at the beginning of this article, it is much higher above the water line than the old one. While this height accommodated the rise in the bank on the east side of the river, it necessitated an enormous amount of fill on the west approach. A few general facts in regard to the bridge will be given before the account of the track and trolley construction on it.

The draw is of the bascule type. The counter weights each weigh 583 tons and are so adjusted with reference to the weight of the lifts that two men can open either side of the bridge. Two 37-hp. induction motors are used, one for each lift, but only 20-hp. is necessary to do the work. In the two lifts a total of 813 tons of steel was used; 32 tons of this amount comprises the weight of the two trunnions. All the machinery used in the operation of the lifts would balance a 200,000-lb. weight. For the operation of the bridge, the main cable, pier lamps, roadway lamps, etc., more than 5 miles of wire had to be used.

From the point of junction of the old and new trolley routes on the Stratford side to the Milford side the old distance was 2,706 ft. The new route is 56 ft. shorter, or 2,650 ft. On the old layout the distance from the change in track location on the Stratford side to the center of the bridge is 1,150 ft.; the corresponding distance on the new layout is 1,300 ft. On the old trolley line there were 820 ft. of double track on the Stratford approach up to the bridge, then 666 ft. of single track across the bridge and 1,220 ft. of double track on the Milford approach. The new layout is double track throughout, and it eliminates the only break in double track between Bridgeport and Milford.

On the new bridge the track on the west approach consists of 771 ft., while that on the east approach is 1,014 ft. in length. The length of track on the concrete part of the bridge is 865 ft., 183 ft. of which is on the lifts.

The bridge was built under the direction of engineers of the State of Connecticut, so that in their work of constructing track across this bridge the Connecticut Company engineers had to adapt their work so as not to interfere with the bridge construction.

As the feeders approach the bridge, the first change in construction takes place with the connection of the

Digitized by Google

overhead construction to the underground feeders on the approach itself. Dossert "T" connectors were used to attach overhead feeders to the feeders that ran down the laterals. From the laterals the feeders were run directly through a manhole without splicing and carried along under one sidewalk up as far as the lift itself.

There were six cables thus strung up to the main pier of the bridge, after having been snaked through underneath the sidewalk. This was necessary because the sidewalk was laid before the work was begun. This made the task a very tedious one because there was a space of only 11 in. between the sidewalk and the concrete stringers. Cleats of wood saturated with carbolinium were placed on each stringer to support cables.

Four of these six cables are made up of 750,000 circ.mil flexible stranded rubber-covered copper wire, one No. 6 rubber-covered copper cable for signal purposes and one No. 0000 copper wire, which was used to carry current merely to neutralize the stray currents which were influencing the American Telephone & Telegraph Company's lines. When they reached the lift the feeders had to be changed from rubber-covered into armor-clad submarine cables, so that they could be carried under water to reach the other side of the channel.

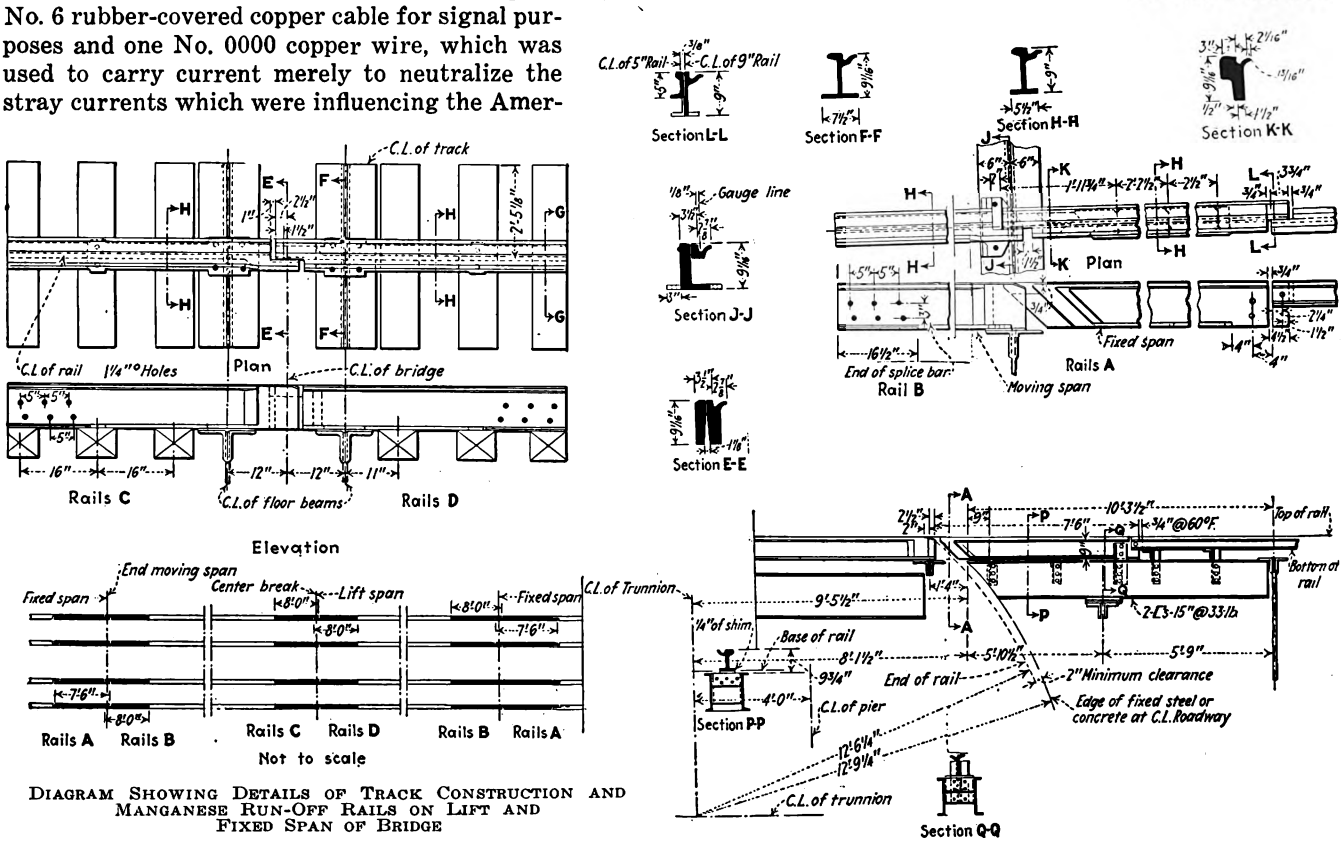


DIAGRAM SHOWING DETAILS OF TRACK CONSTRUCTION AND MANGANESE RUN-OFF RAILS ON LIFT AND FIXED SPAN OF BRIDGE

To do this, the feeders were connected to the submarine cables through a switch box employing 1,000-amp. switches for the main cables and a 500-amp. switch for the signal cable. Two spare 1,000-amp. switches were connected with two spare submarine cables in case some misfortune should cut one of the cables already in use. Before reaching this switch box the signal and four feeders were connected through Westinghouse m. p. lightning arresters. These arresters were connected through a common ground wire to a 1½-in. iron pipe, 18 ft. in length. This pipe was driven into the ground inside of the dolphin, and the No. 0000 copper wire from the arresters was welded to a cap on the top of the pipe.

Leaving the switch box, the submarine cables were cleated to the abutment at dead low tide to resist any possible strain from ice, and then were laid in a trench 6 ft. in the mud outside of the dolphin. The distance from the switch box to a similar box on the other side of the bridge is 435 ft.

In the same trench with the feeders are four 750,000 circ.mil cables for the return circuit, connecting the four rails on the two sides of the bridge. These four cables are connected together at each end by a copper bus bar to protect against the failure of any one cable. Through a knife switch on the trunnion of each lift, a common connection is made from the four cables connecting the rails on the standing part of the bridge to a bond connecting the four rails on the bascule lift.

SETTING OF POLES WAS DIFFICULT

Considerable difficulty was encountered in the setting of the poles on the approaches since all the ground on the approaches was fill and not firm. To make the poles so that they would not give and allow the wire to slacken, very large holes were dug in the side of the fill, in some cases to a diameter of 16 ft., and boarded to prevent slide. The poles were then set 16 ft. in the ground with cement around their base 6 ft. in depth and 3 ft. in diameter. Fifteen poles were set in this way. Fifty-five chestnut poles were set altogether, and they were afterward graded to the specifications of the bridge engineers. To secure these poles further, they were back-anchored to rails 6 ft. long, which were sunk in the fill and concreted in. Guy wires were then attached. Pole derricks had to be used in setting the wooden poles.

On the bridge itself 3-ton solid reinforced concrete poles with square bottoms were used. These poles were made complete upon the ground and were raised and set in holes about 4 ft. deep. While these poles were being made, a short section of galvanized iron pipe was set in the pole at the proper height for the overhead span wire. A bronze ¾-in. x 18-in. eyebolt was later passed through this pipe in the pole to hold the span

Digitized by Google

THE ENTRANCE TO LIFT CLOSED AND TRACKS OPEN FOR OPERATION

wire. These poles were modeled after the type used on the Eighth Street Bridge by the Lehigh Valley Transit Company in Allentown, Pa.

Seven-strand $\frac{5}{16}$-in. copper weld span wire, which is practically free from corrosion from salt water, is used for the overhead and on the bridge is attached to these bronze eyebolts.

CONSTRUCTION ON THE LIFT

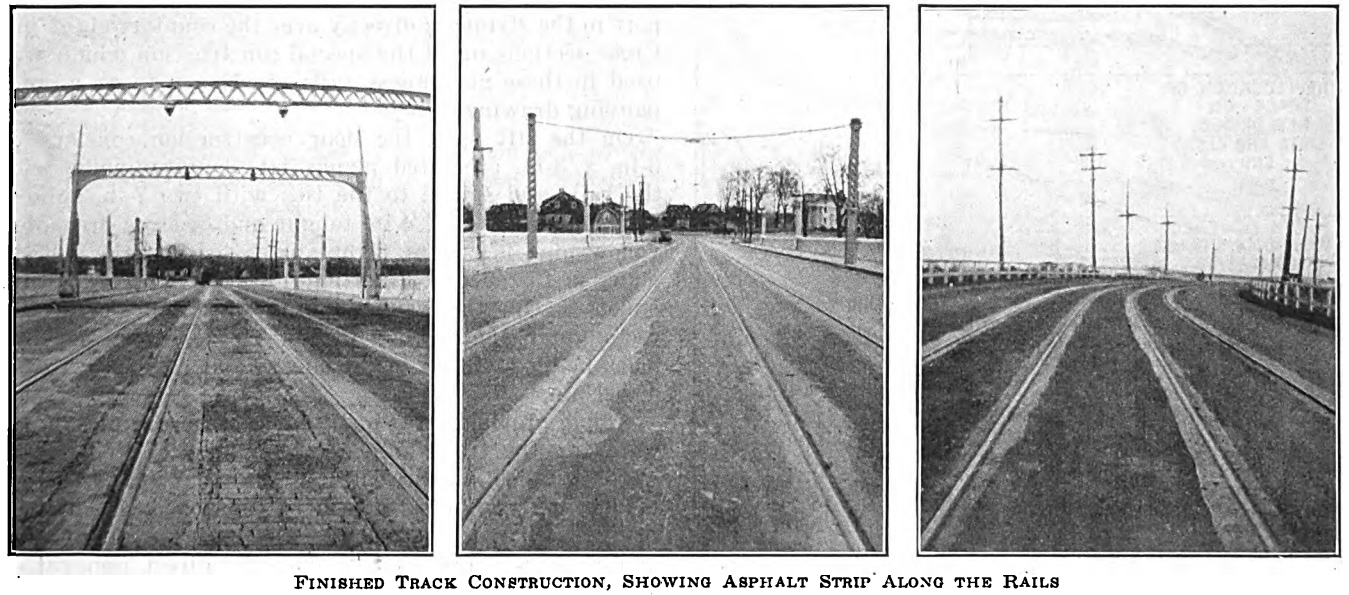
On the bascule lift the overhead construction used is similar to that employed in similar installations by the Chicago Surface Lines. This system may be called the tight live trolley wire, which, in this case, is copper and No. 00 in size. Half of the overhead on each lift is rigid, the other half of the wire being kept taut when the bridge opens by a counterweight on a flexible guy wire which takes up the slack as the lift is raised. The wire is drawn back through an idler, which keeps the wire in position, the tension being supplied by a 1,050-lb. weight. The counterweight for each wire is contained within steel towers about 100 ft. from the lift. By a system of sheaves, the ratio of the movement of the wire to the drop of the weight is 3:1.

This overhead construction on the bridge was installed by the state and differs in some respects from the standards in such places of the Connecticut Company which call for a slack, dead wire. The Connecticut standard allows the wire to hang limp when the bridge is open to navigation, and a knife switch is located on the trunnion which makes and breaks the circuit when the lift is lowered or raised respectively.

TRACK CONSTRUCTION ON APPROACHES

The track construction on the approaches consists of 5-in. 80-lb. T-rail, laid on oak and chestnut ties 6 in. x 8 in. x 8 ft. in size. The ties are laid on 2-ft. centers, and the rails are spiked to the ties with $\frac{5}{16}$-in x $5\frac{1}{2}$-in. cut spikes. Sixty-foot rails are used, the ends being joined together with continuous joint plates, 24 in. long. Each joint is bolted with two $\frac{7}{8}$-in. x $4\frac{3}{8}$-in. bolts. The joints are bonded with two 40-in. No. 0000 concealed bonds. The joint plates were electrically welded at the top to the rails by the Lincoln motor-generator process, 2 in. being left on each extreme end. Two oblong holes, 3 in. x 1 in. in size and about 9 in. on each side of the joint, were cut in the base flange of the joint plates, and the plates were welded to the base of the rail at these points.

The ties and track on approaches was laid on crushed stone and gravel ballast. The pavement is a 3-in. surface asphalt on a 6-in. concrete foundation. The concrete base was constructed so as to give a 5-in. depth



FINISHED TRACK CONSTRUCTION, SHOWING ASPHALT STRIP ALONG THE RAILS

Digitized by Google

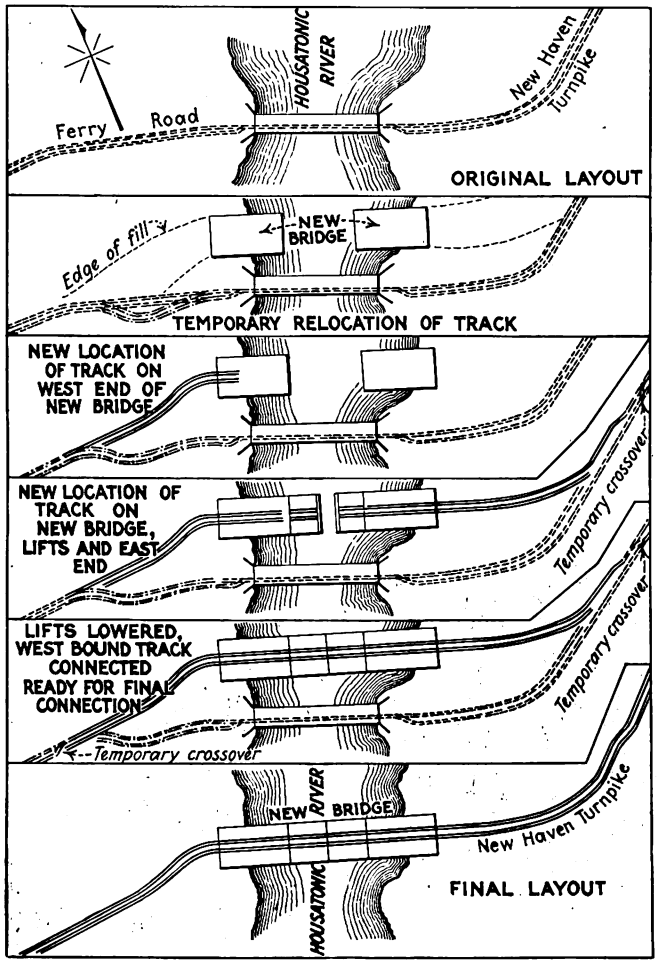
under the base of the rail, this construction providing a concrete tie for a foundation in the event of the decay of the wood tie. Due to the fact that experience has shown the tendency of the asphalt to curl up and break away where it joins the rail, particular care was taken by the company's inspector to see that the asphalt was thoroughly rammed under the head of the rail, entirely filling up this space. It is expected that this will prevent dirt from working in between the joint of the asphalt and the rail and getting in under the asphalt, causing it to spawl off along the rail.

An additional preventive was taken to reduce trouble along the rail by sealing the joint between the asphalt and the rails with a squeegee coat of high test heated asphalt. This was followed with application of hot irons. Some of the views accompanying this article clearly show the results of this work. It will be noted that the seal coat takes in a strip about 8 in. wide along each rail, which is the area that the Connecticut Company is obliged to maintain under the paving law passed by the Connecticut Legislature early in 1921.

The track construction on the concrete portions of the bridge is the same as that on the earth approaches, except that the track is laid in a concrete trough with a ballast of crushed stone. The depth of ballast is about 4 in.

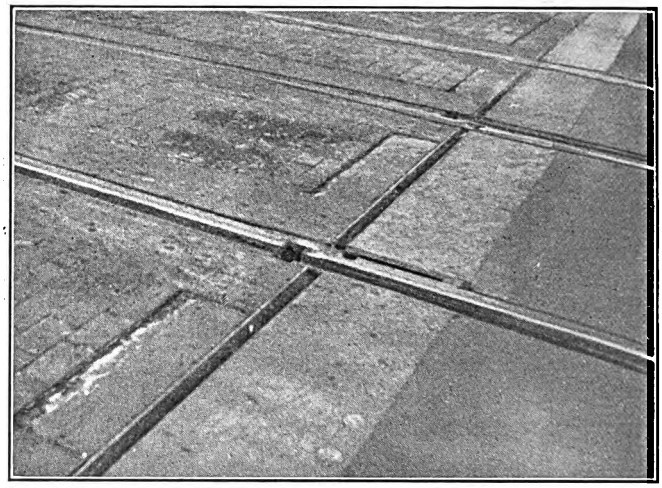
Track Construction on Lift Span

On the lift span, 9-in., 120-lb. Boston grooved rail, laid on 6-in. x 8-in. x 8-ft. creosoted yellow pine ties, was used. The rails are in 50-ft. lengths and twelve-hole bolted channel bars are used at the joints. The ties



Sketches Showing Different Stages in the Work of Changing the Track from the Old Bridge to the New Bridge

are dapped ½ in. over the 18-in. I-beams running longitudinally under each rail. The ties are fastened to the I-beam stringers with ¾-in. x 5-in. lag screws. Each rail is fastened to each tie with two ⅞-in. x 5½-in. wedge pointed square spikes. To prevent creeping, the rails are



Mitered Joint in Manganese Run-Offs Between Lift and Stationary Portion of Bridge

fastened at each end with ⅝-in. x 5½-in. lag screws, which pass through drilled holes in the base of the rail.

The rails adjoining the three breaks in the lift spans, one on either end and one in the center, consist of 8-ft. lengths of manganese steel. With double track and three breaks there are twenty-four of these pieces. The manganese steel sections are the same depth as the rail on the lift but they are of special form. A continuous tread bearing is furnished to the car wheels at these joints between rail steel and manganese steel by the use of square mitered joints, as can be seen in the attached sketch. This is the first use of mitered joints on trolley tracks in this section of the country. Manganese rails are used at these points to prevent pounding and wear.

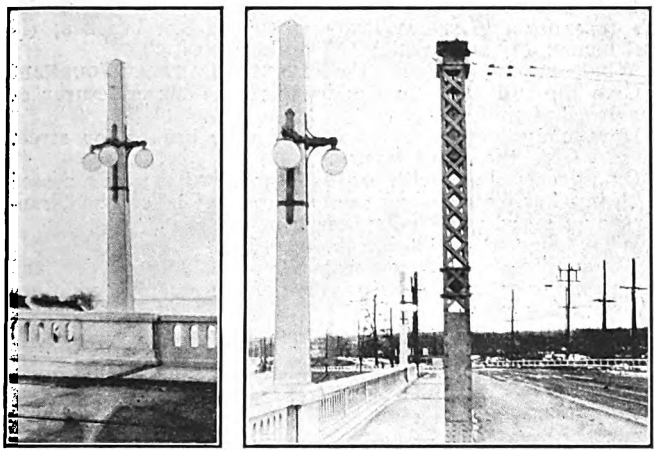
The sections of manganese rail on the stationary parts of the bridge rail are mitred not only at the breaks, but also at their outer ends where they join with the 5-in., 80-lb. T-rail which is used on the bridge approaches. At this point considerable space is left to provide for expansion of the rails on the approaches. The compromise joint between the 9-in. manganese casting and the 5-in. rail is made by means of a stepped steel support in the stringers directly over the counterweight pit. Cross sections of all the special construction which was used in these manganese rails are shown in an accompanying drawing.

On the lift span the floor construction consists of 3-in. x 8-in. creosoted planks laid longitudinally with the rails and spiked to the ties with two 7-in. spikes. The sub-planking of 4-in. tongue and grooved creosoted yellow pine is laid at right angles to the rails. Each plank is fastened to each nailing strip with two 6-in. spikes. On this sub-planking are laid creosoted rectangular shape wood paving blocks, every seventh block being fastened to the sub-planking by means of a dowel pin.

Ample provision was made for taking care of surface water on the track area of the bridge. Catch basins were installed at the ends of the fixed spans of the bridge and two sets on each of the approaches to the bridge. On each approach of the bridge a pit of adequate size was provided to allow for direct removal of snow. Prior to the work of bridge construction, the

Digitized by Google

engineer representing the State Highway Department and the division engineer of the Connecticut Company planned each step in the method of construction of the new tracks and the removal of the old tracks to allow for the continuous operation of trolley traffic with the



AT LEFT, ORNAMENTAL CONCRETE POLE, AND AT RIGHT, LATTICE POLE WHICH SUPPORTS SPAN WIRE ON CONCRETE PORTION OF BRIDGE

maximum amount of track facilities without detriment or interference with construction of the bridge proper or the laying of the paving. The first step was to relocate a section of about 800 ft. of double track south about 100 ft. from the highway on to private land. The necessity for this relocation was to allow the State to complete a fill on the west approach to the bridge. It was necessary to obtain a lease of this land from three different parties and arrangements were made for its lease for the duration of the bridge work. The next step was to cut in a switch in the westbound track on the west approach to the bridge and build the new westbound track up to the lift span. As it was impossible to build across the lift span at this time, the second track on the west approach was then constructed. During the construction of these two tracks the ties and rails were laid on two lift spans. It was necessary to lay this track with the lift spans raised at an angle of 70 deg.

The next step was to cut in a switch on the east approach to the bridge, taking off from the westbound track. To do this, owing to a change in the grade of several feet, it was necessary to remove a section of the westbound track between the old bridge and the point where the switch was to be put in. This removal of the old track required the installation of a left hand portable crossover easterly of the point of switch to take care of car operation. It required also a transfer of the United States signal from the old end of the double track at the old bridge to the new temporary crossover. After this work the new westbound track was laid up to the lift span.

Following this, the new eastbound track was constructed. This track was laid from the lift span up to a point about 300 ft. from the point of junction with the old layout, and it was built easterly as far as possible without interfering with the old eastbound track, which at that time was carrying all of the car traffic. The pavement construction on both approaches followed closely behind the trackwork. The work on the lift span being completed, the westbound track was connected up at each end.

Temporary crossovers, a right hand on the east approach to the bridge and a left hand on the west approach, were then installed to allow for car traffic being turned across the westbound track on the new bridge. This change in operation necessitated the transfer of the United States signal on the west approach to the bridge. Following this, operation was begun across one track on the new bridge and track forces were immediately put to work in tearing out the old tracks on each approach to allow for the completion of the connections of the new eastbound track. The tracks were then paved, after which the remainder of the old tracks was removed. All this new track construction and relocation of old track was accomplished without any interference to traffic.

The first track across the new bridge was opened jointly for car operation with vehicular traffic on Nov. 1, 1921. The bridge was entirely open for traffic on Nov. 11, 1921. The engineer for the Public Utilities Commission inspected the construction on Nov. 1, 1921.

Preparing for Electric Traction

AT EDINBURGH, Scotland, the street car system, which has long been operated by cable, has at last succumbed to progress of the times and is being electrified. The accompanying photographs are forwarded from Edinburgh as evidence of that fact. One of the photographs was taken in the armature winding shop of the Strubhill Depot, where formerly only cable car repairs were carried out. There is no doubt about what sort of equipment is being worked on here.

GRAPHIC PROOF THAT EDINBURGH TRAMWAYS ARE NOW BEING ELECTRIFIED

The other photograph shows an extension being built on the Leith carhouse to accommodate the new Edinburgh cars when the system has been electrified. The cost of the carhouse extension is £24,000.

WHERE THE CARHOUSE IS BEING EXTENDED TO CARE FOR THE NEW ELECTRIC EQUIPMENT

Examination for Foremen

Beaver Valley Traction Company Asks Answers to Sixty-seven Questions Relating to the System to Test Knowledge of Its Employees

GREAT interest was attracted last summer to the questionnaire of Mr. Edison, drafted to determine knowledge on general subjects possessed by applicants to employment with him. Last fall W. H. Boyce, general manager of the Beaver Valley Traction Company, decided it would be well to test the knowledge of the foremen, dispatchers and office employees on that property, not on general subjects but on matters applying directly to the operation of the line. In consequence, he prepared the sixty-seven questions given in the list below and submitted them for answer to the group mentioned. The results obtained were such as to stimulate an interest in the daily affairs of the company among this group. They suggest the desirability of other companies conducting similar examinations.

What is the total population served by the Beaver Valley Traction Company and the Pittsburgh & Beaver Street Railway Company?

How many miles of track do we have in the Beaver Valley Traction Company and the Pittsburgh & Beaver Street Railway Company?

Where is the division line between the two companies?

What is the total number of passenger car-miles operated per day on both systems?

What was the total gross revenue for both companies last year?

In your opinion how much less will our revenue be this year than last in both companies?

When does the last car leave Ambridge for Beaver?

At what time should a person leave East End Avenue, Beaver, to connect with car at Fifth Street, Beaver Falls, Harmony line?

What is the fare from Beaver Falls to Industry?

What is the fare from Rochester to Butler?

What is the fare from Ambridge to Morado?

Give average number of car stops which our cars make per car-mile operated.

In labor turnover, what is considered a fair percentage?

What is the average number of car failures per thousand car-miles?

Who built our center-entrance steel cars?

Who built our safety cars?

Is it compulsory that cars be equipped with jacks? If so, why?

In what boroughs do the companies' franchise ordinances regulate the interval between cars? What is the minimum interval required?

What is the value of all our materials carried in stock?

What is our yearly cost of stationery, printing and postage?

What is our total monthly payroll now?

If we desire to put into effect a new tariff, how many days' notice does the Public Service Commission of Pennsylvania require for (a) increase; (b) decrease?

By whom may a complaint be filed against a tariff?

If a complaint is filed, does the new rate go into effect before a hearing is held by the Public Service Commission of Pennsylvania?

How many square miles of street paving do these companies maintain?

What is the average distance a passenger rides?

What is the horsepower of the motors on safety cars?

What is the kilowatt consumption per car-mile for: safety cars, double-track steel cars, double-track wooden cars?

With current cost at 2 cents per kilowatt-hour, what will it cost this company to burn a cluster of five 23-watt lamps twenty-four hours per day? How much per year?

How many watts in an electrical horsepower?

If a vehicle is damaged in collision with a car, who should care for the damaged property? Why?

Why should dispatchers or inspectors spend as much time as possible riding on the cars?

What height does the law require a trolley wire to be above the rail at steam crossings?

Before any work is started on a new construction job, what should be done to be sure that there will be no misunderstanding with the accounting department?

Who controls the advertising space in the regular advertising racks in our cars? What is the address of this firm?

What is the title of the official organ of the American Electric Railway Association?

Who is the secretary of this association?

Who controls the patented devices on safety cars?

Name a manufacturer of: (a) trolley wire; (b) car jacks; (c) car gears; (d) steel ties; (e) automatic block signals; (f) fare boxes; (g) car heaters; (h) carbon brushes; (i) rail bonds; (j) steel rails; (k) brake shoes.

What company publishes the ELECTRIC RAILWAY JOURNAL?

Give the full name and address of the manufacturer of our No. 514 motors.

How many companies manufacture air brakes for street cars? Give their full names.

On a good rail and with brakes in good order, with a seated load, in what distance can the ordinary car be stopped, running at a speed of 18 miles per hour?

What per cent of 720,000 is 540,000?

If the receipts of a company are $650,000 per year, and its operating expense is 87 per cent of the receipts, what are its operating expenses?

Why should a date always be put on all data and inter-office communications?

In addition to all construction expense, to what boroughs did these companies pay a bonus? Show the amount paid each.

What is the total amount of bonds of the Beaver Valley Traction Company in the hands of the public?

What is a watt?

What is voltage?

What is an ampere?

What was the number of car riders carried last year by both companies?

How much of a dividend is paid each year on the stock of the Beaver Valley Traction Company?

Give the name and address of the manufacturer of Spearmint gum.

What baking powder is advertised in our cars?

What bank advertises in our cars?

What is the distance from Junction Park to end of line, Morado?

What is the distance from Junction Park to Sassafras Alley?

What is the distance from Ferry Street to Leetsdale?

How many thousand car-miles life do we get out of 33-in. steel wheels?

What does "C.M." stand for when used in connection with wires and cables?

Name five street railway companies which are in the hands of receivers.

How many more seats do we furnish per day than there are passengers to ride?

If each conductor should fail to register one fare for each zone that each car passes through per day, what would the loss to these companies amount to in one year?

Give the exact location of: H. H. Robertson Company; Moltrup Steel Products Company.

What is the cost of welding a joint by the Lorain process?

What is the cost of excavating for and replacing the paving after welding?

How long should these joints increase the life of the rail?

Foreign Standards Available Through A. E. S. C.

THE American Engineering Standards Committee has selected and listed a large number of standards issued in 1921 by foreign national standardizing bodies. Copies of these can be had from the office, 29 West Thirty-ninth Street, New York City, at merely nominal prices.

Among these standards may be mentioned tramway tires and tramway axles (British), benzol for motor fuel (British), creosote for the preservation of timber (British), brick (Canadian), bolts and rivets (Canadian) and roofing tiles (German). More than 100 specifications are included in the list. In acting as sales agent for the standardizing bodies of other countries, the Standards Committee is carrying out a plan which is being followed throughout the standardizing countries.

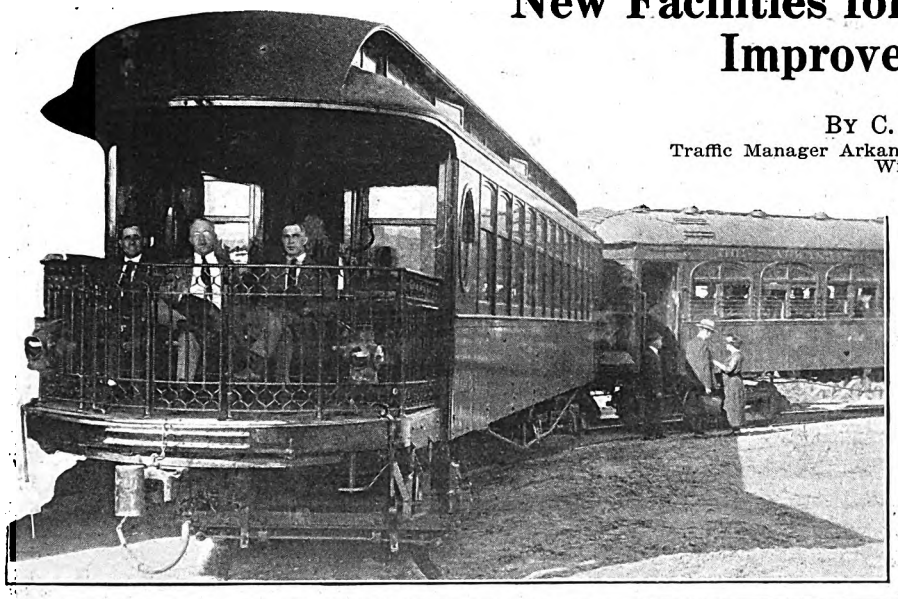
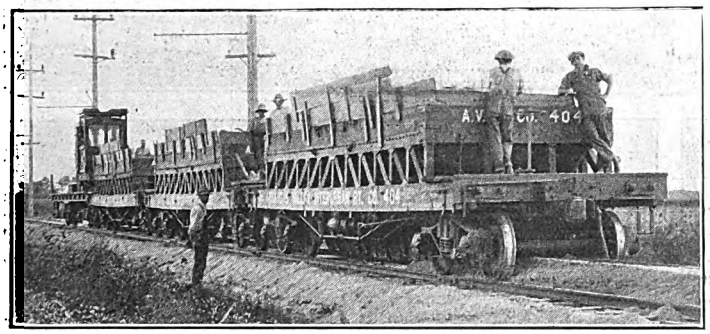
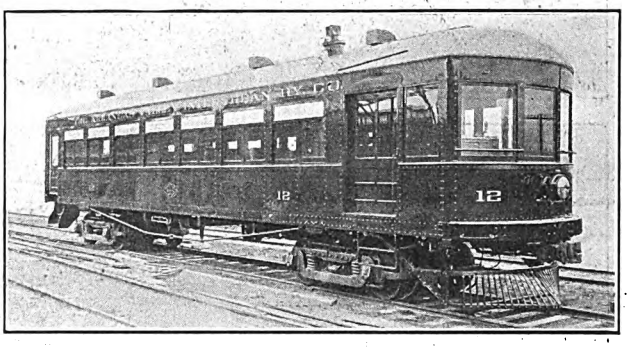
New Facilities for Kansas Interurban Improve Earnings

BY C. M. MORRISON
Traffic Manager Arkansas Valley Interurban Railway, Wichita, Kan.

Private Right of Way Into Wichita and New Passenger and Freight Terminals and Shops Built, Roadbed Improved and New Steel Cars Purchased







At the top is an observation trailer used with two and three-car trains. Below at the right is shown the latest type of all-steel passenger car in use on the Kansas lines; at the left, a work train distributing ballast in improving roadbed.

SINCE the property of the Arkansas Valley Interurban Railway, connecting Wichita, Kan., with Hutchinson and Newton, Kan., was described in the issue of the ELECTRIC RAILWAY JOURNAL for June 2, 1917, Vol. 49, page 996, rather extensive improvements have been made. These have included the purchase of new all-steel passenger cars, the building of a new passenger station and general office building, freight terminal and shop in Wichita, the building of a private right of way into Wichita and general improvements over the road.

Formerly, entrance into Wichita was made over the tracks of the local street railway company, but it became evident in 1918 that the passenger, express and package business handled by the interurban company was growing to such an extent that it would be greatly to its advantage to operate over private right of way. Such a right of way through the north and west sections of the city was secured during the next two years, and in 1920 the new track was built, leading to the 12-acre terminal site located on the east bank of the Arkansas River at Douglas Avenue, which had been purchased by the company. This piece of ground is only four blocks away from the main business center of Wichita, providing a very favorable situation for the passenger and freight terminals of the interurban line.

A beautiful new two-story passenger station and general office building was erected during 1921, facing on Douglas Avenue. A new freight station located almost directly behind the passenger station and fronting on Waco Avenue was also built. The building of the terminal track, the two-story freight station, the two-story passenger station and general office building, the retaining wall along the river, and a five-track shop located on the opposite side of the river, were completed at a cost of $380,000. The use of the private right of way and new terminal facilities has made it possible to cut from five to ten minutes off the running time of various trains.

The new Wichita passenger station and office building measures 100 ft. x 100 ft. and is built of dark red tapestry brick with stone trimmings and green tile roof. It is considered one of the finest stations of its kind in the country. The ground floor comprises a large waiting room located at the rear of the building and connected with the Douglas Street entrance by a long, wide corridor. The height of this waiting room takes in the entire two-story height of the building. The ticket office is located at one side of the waiting room and the baggage and express room directly opposite. There is an up-to-date restaurant and lunch room adjoining the waiting room, and the remainder of the ground floor is given over to various shops. A ladies' rest room and men's smoking room are provided directly off the main waiting room, and the stairway to the general offices upstairs also leads off the waiting room.

The interior of the waiting room and corridor is finished in buff-colored tapestry brick with glass partitions and oak woodwork separating it from the restaurant and shops. All of the second floor of the building is used for the general offices of the company and these rooms are reached from a hallway or balcony

Some of the Improved Facilities Which Have Resulted in Increased Business for the Arkansas Valley Interurban Railway

No. 1—New passenger station and general office building at Wichita, Kan.

No. 2—Waiting room in the new interurban terminal, Wichita, Kan.

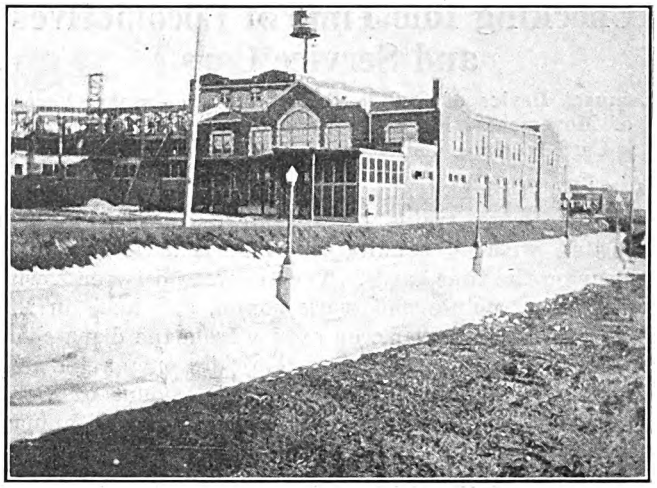
No. 3—Interior construction and equipment of new Wichita shops.

No. 4—New interurban freight station at Wichita.

No. 5—Six-track shop recently built for Kansas interurban.

Digitized by Google

NEW HOTEL ADJACENT TO INTERURBAN TERMINAL NEARING COMPLETION



RETAINING WALL ALONG ARKANSAS RIVER WHICH PROTECTS NEW STATION—NEW HOTEL IN BACKGROUND

which overlooks the passenger waiting room below. All of the offices in the building are finished in natural oak except that of the president, which is finished in mahogany.

The new freight station at Wichita is constructed of red brick with the freight room on the first floor and three offices and a large room, where meetings and social sessions are held by the trainmen, on the second floor.

The new car shops are of up-to-date design and provided with six tracks and all well equipped for handling the equipment repair work.

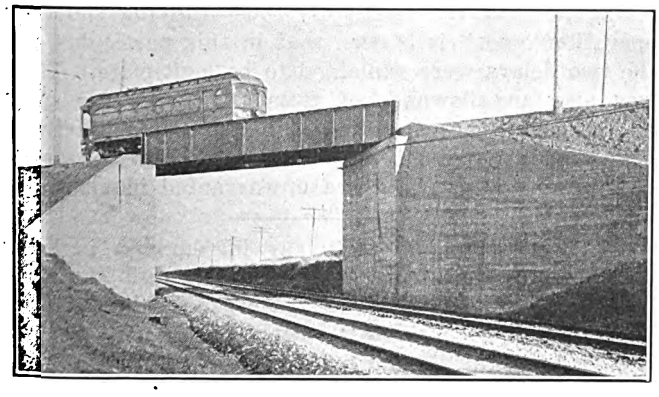
Industrial tracks are now being put in to reach several of the larger industries at Hutchinson, Kan., and also track connections with some of the steam roads. Other steam-line connections are expected to be put in at Newton. Through traffic arrangements with the steam lines are anticipated, and with these physical connections the interurban will be in position to handle all classes of freight, both carload and l.c.l., to and from all points, which should be the means of very materially increasing the freight revenue.

	1914	1916	1918	1920
Gross earnings	$137,454	$271,107	$328,611	$547,375
Operating expenses	79,612	140,684	228,737	337,254
Net earnings	$57,842	$130,423	$99,874	$210,121
Interest and taxes	58,387	83,222	95,150	79,646
Net revenue	$545*	$47,201	$4,724	$130,475

* Loss

Another thing which may bring additional passenger business to the interurban is the construction of a new $600,000 hotel to be known as the Broadview, on property adjacent to the interurban passenger terminal. While this hotel is not the property of the interurban, a large amount of the stock is owned by stockholders of the railway, and it is planned to have a large arched corridor directly connecting the lobby of the hotel with the passenger terminal.

That these various improvements have been instrumental in improving the operating efficiency of the company and bringing new business to it is shown by the accompanying operating statement of the company for two-year periods since 1914.



A. V. I. CROSSING OVER SANTA FÉ TRACKS ON NEWTON BRANCH

Santa Fe Line Proposes to Extend Into San Pedro Harbor of Los Angeles

THE Board of Harbor Commission of the city of Los Angeles has granted the Atchison, Topeka & Santa Fé Railway permission to enter into the Los Angeles harbor at San Pedro for the purpose of constructing and maintaining a railroad line into the harbor in competition with the Southern Pacific Line, Los Angeles & Salt Lake Railroad (Union Pacific System) and the Pacific Electric Lines. In order to reach the harbor the Santa Fé is obliged to construct a branch extension of some 15 miles from a point on its Los Angeles-Redondo Beach branch line, diverging from this branch line at some point between Inglewood and Redondo, thence to the harbor at a point at the northwest corner of the west basin of Los Angeles harbor.

The project will involve the expenditure of approximately $2,000,000. It will be undertaken as soon as certain franchises are granted by the city of Los Angeles and permission obtained from the Railroad Commission, as well as from the War Department, to span the west basin with a trestle.

Practically all the municipally owned tracks of the city of Los Angeles at the harbor serving the municipally owned wharves and warehouses in the inner and outer harbors, as well as numerous large industrial plants, are electrified and electrically operated. The city's trackage of approximately 12 miles equivalent single track was electrified at time of original construction, and the switching on these tracks is performed by the electric locomotives of the Pacific Electric Railway, which has interchange connections with the city's trackage and handles the service for the city through agreement.

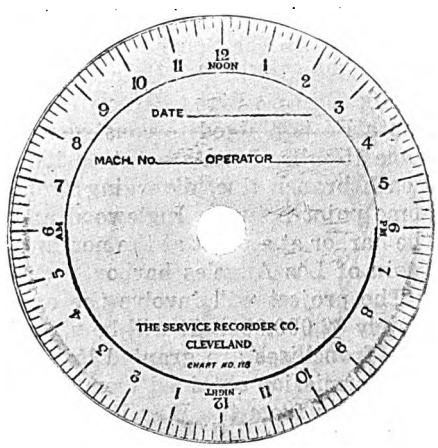
Checking Idle Time of Locomotives and Service Cars

Compact Device of Simple Design Makes Graphic Record of Movements—Keeps Crews of Trains Not on Time Card Working and Accounts for Legitimate Delays

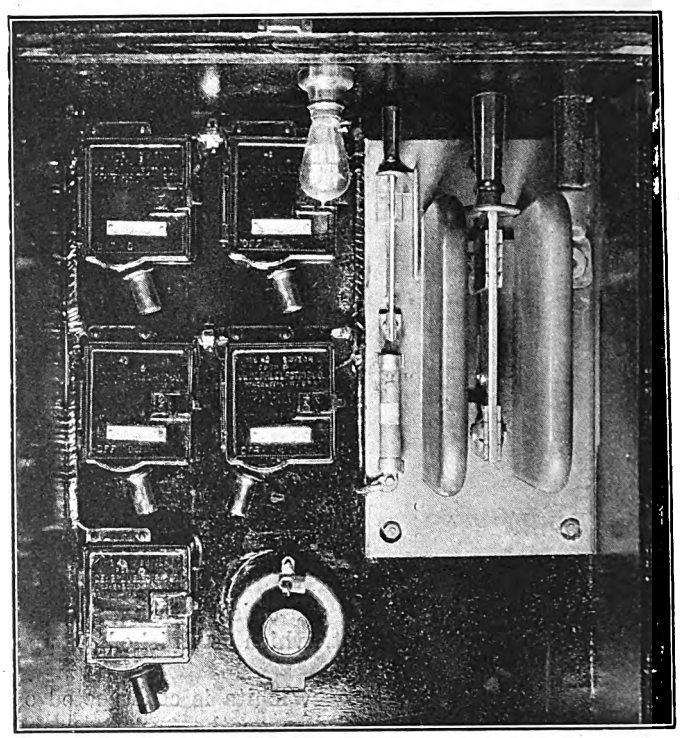
MANY freight trains, line cars and maintenance of way work trains on an interurban railway are operated without definite schedule time and do not appear on the time cards. They operate between towns and passing points and work points, and keep in the clear of scheduled traffic on orders from the dispatcher. The crews of such trains are therefore out on the line largely without supervision and the amount of work they do is at their own discretion. As a natural human trait, some loafing develops.

As a check on the idle time of these "extra" trains, the Illinois Traction System has installed on twenty-five of its electric locomotives a small device called a "service recorder" which makes a twenty-four-hour graphic record of the time during which a locomotive is running or standing idle. This device is manufactured by the Service Recorder Company, Cleveland Ohio, and consists of a simple clock mechanism for driving the paper chart and a pivoted weight having a steel point which bears against the paper chart. The whole mechanism is contained in a neat little steel case about 6 in. in diameter and 4 in. thick, and the device may be mounted anywhere in a car. When the engine or car is standing, the device produces a simple line on the chart, but while running, the vibration causes the weight to swing slightly, producing a jagged mark. The use of a special type of paper results in a distinct marking of the chart without the use of ink. There is therefore nothing to do to keep the device operating except to wind the clock and replace the chart once in twenty-four hours. On the Illinois Traction System locomotives, the device is mounted in the bottom of the switch cabinet, where it cannot readily be mechanically connected with the air pump, for example, to produce an artificial motion record. The value of the device is greatest on engines engaged entirely in switching, as the dispatcher has some check on a train out on the road, but he has practically none on a switch engine. A device is taken off a locomotive now and then and put on a line car for checking up on the work done by a crew stringing trolley wire, setting poles, etc., or on other work cars for a check period. If excessive idle time appears on the chart, a check-up is made.



A TYPICAL CHART MADE BY "SERVICE RECORDER" MOUNTED ON LOCOMOTIVE

The routine on the Illinois Traction System is that the mechanical department inserts and removes the charts and forwards them to the superintendent, who has the chart checked with the train operation report daily. If the chart for any locomotive shows up excessive idle time, the superintendent writes a letter to the crew for explanation, and then the reply and the whole correspondence are forwarded to the general manager.



"SERVICE RECORDER" MOUNTED IN SWITCH CABINET OF AN ILLINOIS TRACTION SYSTEM LOCOMOTIVE

A typical chart taken from the "service recorder" is reproduced herewith. By consulting the train operation report, the movements of the particular engine can readily be traced and explained for the day, as follows:

The engine left Springfield, Ill., at 7:01 p.m., with fifteen cars of grain for Granite City, Ill., where it arrived at 6:30 a.m. En route, at 11:10 p.m. it had to clear, at the Alton siding, a northbound fast freight train which had the right of way. There was a delay of nearly forty-five minutes here waiting for the passing. It was necessary for the train to remain here rather than to proceed further while waiting, as the next passing point was beyond Carlinville and there was work to be done at Carlinville. The train then lay at Benld from 1:15 to 2:10 in order to clear a sleeping-car train. The freight train left Benld right after the sleeping-car train showed up, indicating that the crew had completed the loading and unloading work at this point before the wait for the passenger train began, although there was evidently not time to go to the next siding to make the meet. By thus studying the train operation report, it is seen that in this particular case the two delays were explained to be legitimate. There was also an allowance of twenty minutes for lunch which may have been taken at Benld. This illustrates how a long standing period as recorded on the device may be analyzed to disclose unwarranted idleness.

The first one-man safety car in England is being tested out by the London United Tramways. Owing to the absence of a double deck and other special features, it is attracting considerable attention. About the only change from the standard American style of car is the use of track brake.

Electric Railway Publicity

Devoted to How to Tell the Story

$825,000 of Preferred Stock Sold

Publicity Playing a Very Important Part in Distributing Security Issue Among Residents of Territory Served by Northern Ohio Traction & Light Company

BY E. B. ATCHLEY

EMPLOYEES of the Northern Ohio Traction & Light Company, Akron, Ohio, began the sale of the company's 7 per cent preferred stock to the public last July. At the close of business on Feb. 28 approximately 6,750 shares of a par value of $100 each—$675,000—had been sold by them. About 1,500 shares have been sold through other sources, bringing the total to a little more than $825,000 in approximately seven months.

How was this accomplished in view of the business depression so keenly felt in that section of Ohio traversed by the lines of the company? That is the first question to arise. What methods were adopted to interest the employees and to keep that interest aroused? That, perhaps, is the second question to arise. Every company planning to start a customer-ownership stock selling movement is interested only in this—and presentation of the advantages to the public.

The Northern Ohio Traction & Light Company has approximately 2,000 employees. When the movement to sell the stock was launched in July, meetings of employees were held in every department over a period of a week. The reason for issuing the stock and the reasons why the employees were needed to sell it were thoroughly explained by A. C. Blinn, vice-president and general manager, and other company officials. At these meetings the employees were asked to buy stock.

DETAILED PREPARATION FOR SALE

Prior to calling the meetings, the company had prepared an extensive advertising campaign. The issue was thoroughly explained in the employees' magazine. Letters to all employees and all customers had been prepared and signed by Mr. Blinn and were ready to go into the mail. This advertising—letters, magazine, all literature—was released immediately following the meetings with employees. The newspaper advertising and the street car advertising were used effectively to back up the employees. Each advertisement contained this line: "Ask any employee for information."

Almost 1,700 shares had been sold by Aug. 1 and 1,450 more were sold in August. Most of these 3,150 shares were taken by employees. The work of selling the actual stock to employees proved easy, despite the fact that the plan was launched immediately following a strike of the trainmen. The task of selling them the idea of selling customers proved not so easy, however. Trainmen were particularly slow to take hold in the sale. The employees in the ways and structures department—track men—were the first to respond to the appeal. In September 516 shares were sold to customers principally by the track gangs—the men who use the pick and shovel. The production and distribution department employees had a hand in the sale, but not to any great extent. General office employees sold very little.

In October and November, in view of the great number of unemployed in Akron and the coming of winter, there was a heavy decline in sales. In December sales picked up to 1,054 for the month, held steady in January and February, while in March about 1,500 were sold, indicating a steady purchase of 1,000 to 1,500 shares by customers monthly.

AROUSING INTEREST PLAYS BIG PART

Now, how has the interest been kept up? The answer to this may prove worth while to companies contemplating permanent financing by this method.

In the beginning, employees were paid a commission of $3 for the sale of one, two, three or four shares, $5 for five shares and 50 cents per share for each additional share to one individual. Special editions of the *Northern Light*, the company publication, were issued weekly containing names of employees who made sales and the number of shares each man sold. Meetings were held weekly with the heads of all departments to discuss the sale of the stock and special meetings were held with the men monthly. An employee of the company who had been placed in charge of the sale talked to all employees once every month, going out to the track and line gangs, shop men, track men and all others. In most instances these talks were delivered to the men in small groups. The men stopped work for a few minutes until the talk and the discussion were ended, when they went back to the job. Appeals were made again and again. After two months only forty-five employees out of 2,000 were actually producing, although prospects were being turned in by about 150 others. It was an uphill job, but after six months effort more than 150 employees are now actually making sales and 1,000 or more others are turning in live prospects.

Late in November the slogan "Buy a Share of Stock for a Christmas Present" was taken up. This slogan, carried in all the advertising, pushed up the December sales. In January, to keep the interest going, special bonuses were offered to the individuals selling the greatest number of shares, to those selling to the greatest number of individuals and to the department making the best sale record. In all, seven prizes were offered.

Following this a new plan was adopted. The commissions were increased to a point where each employee now receives at least $1 for each share he sells. In addition, a special bonus has been arranged. A quota of 1,000 shares was set for the special contest now in progress. If the quota was reached in March each man producing sales received an additional $1 per share. If 1,100 shares are sold, the producing employee receives a bonus of $1.10 per share, or if only 900 are sold the bonus is 90 cents per share and so on, up or down. This method of arousing interest is proving the most effective of all.

In the stock department of the general office in Akron

Digitized by Google

hangs a large chart showing the day-to-day standing of all departments of the company. On this chart the thermometer idea is carried out, the changing conditions appearing in red paint on the thermometer. The chart shows seven departments with the quota for each department. This quota is based upon the number of employees in the department. Similar charts on a smaller scale are placed with each of the seven departments and there is an additional chart showing the department subdivision which is painted in the same manner. This has brought the responsibility for selling the quota assigned to very small subdivisions. For instance, the general office is divided into accounting, billing, commercial, cashier, credit and collection, meter reading, stenographic, payroll, purchasing and claim departments. There is a thermometer showing the standing of each of these divisions based on the quota assigned to it.

Stock Department Resembles Broker's Office

Aside from the charts referred to, there is a large wall map of the system hung in the stock department. Whenever a share of stock is sold a pin goes into the map at the point where the purchaser resides. Needless to say, there are a few thousand pins in this chart, and it is pretty well plastered up. There is little doubt that the map will prove interesting to aspirants for office in this section in the future when questions concerning this utility arise.

Every morning the department head calls the subheads in his department and receives the stock report. This has brought about strong rivalry among the various subheads and often the stock department resembles a broker's office where the tape is bringing figures to be chalked up.

Daily bulletins are quickly made up and are sent to the departments pointing out what some department has accomplished and spurring the others along. These bulletins keep the interest going and have been instrumental in building the sales. Stickers with commission and regular pay checks bearing the words, "I Am Doing My Share, Are You?" and "Sell a Share a Month" also aid in keeping up the enthusiasm.

And now a word about publicity advertising the stock. The price of the stock was fixed at $95 a share and accrued dividend. This price yields the purchaser 7.37 per cent. These figures—7.37—have become synonymous with the company stock the whole length of the system. They appear on all company envelopes, on stickers, in all cars, billboard and newspaper advertising. When the customer-ownership plan was started solid red posters bearing the figures 7.37 in white went into all cars. This created interest and people began asking what they meant. Five days later other solid red posters were displayed in the cars. They carried the words "7.37 per cent. The N. O. T. & L. Co. is offering its 7 per cent cumulative preferred stock at $95 and dividend per share, yielding 7.37 per cent."

The first newspaper advertisement consisted of a full page in all papers in the territory, changed to meet local conditions. In Akron the advertisement dealt principally with the light and power business. Outside of Akron it was confined to the railway business. "Make These Sockets Earn You Money" was the heading of the one with a giant hand turning on light in the home. The other bore the heading "It Earns as It Runs," the words carrying an interurban train. The page advertising was followed by "ads" of four full columns, illustrated, with the headings: "Your Salary May Stop, but Dividends Keep Coming In," "The 'Old Age of Want' Bogie," "Prepare Your Boy for the Battle of Life," "Put the Northern Ohio Traction & Light Company on Your Investment Map," "Protecting Your Electric and Transportation Service When There Is a Storm," "S.O.S." and "The Finest Christmas Present in the World."

Three-column "ads" followed these. Later, however, the "ads" were dropped to two-column, 8 in. Today very little newspaper advertising is being done. Two novel window displays, one consisting of a miniature city, electrically lighted and containing a street railway system with moving cars, and the other displaying the entire interurban system from Cleveland to Uhrichsville, attracted the attention of thousands. These displays widely advertised the stock. In the miniature city little billboards, advantageously placed, urged stock purchases. The displays were in the windows of the Terminal Building, Akron, and just inside that building a "Stock Department" was established, with an employee in charge who had been a successful salesman. Steadily through all this the *N. O. T. & L. News*, the weekly publication placed on the cars, carried information concerning the stock with a blank to be filled out by all persons interested. Many good prospects were developed from this source.

The methods adopted in the sale of stock of the Northern Ohio Traction & Light Company are the same as those that have been adopted on the Consumers Power Company in Michigan, in Peoria, Ill.; Springfield, Ohio; Evansville, Ind., and on other properties operated by Hodenpyl, Hardy & Company, who also operate the Northern Ohio property. On all these properties the sale of stock has been successful, not only in the amount issued to customers but in the establishment of increased confidence and good will.

Publicity Popularizing Weekly Pass

After You Light Up at the Cigar Store Buy a Pass for Fort Wayne City Lines for $1 Good for a Week—Company Supplements Its Original Work

THE Indiana Service Corporation in starting its new weekly pass system on the city lines in Fort Wayne, Ind., relied entirely upon newspaper publicity to acquaint the public with the innovation and to work up a good sale of the passes. No car cards, booklets, folders, billboards or other methods of advertising were used. But the newspaper space used was very large; half-page ads predominated. The newspapers, of course, devoted much news space to the passes, thereby greatly increasing the publicity secured for the new plan.

Later on the company intends to issue a booklet similar to the one which it now uses, and in which the schedules for the different lines are given and in which there is much general information concerning the company. The corporation also intends to include all the information regarding the passes in this booklet. It will be widely distributed on the Fort Wayne city cars, at cigar stores and through the mails.

The initial information which the people of Fort Wayne received as to the intention of the company to sell weekly passes for a dollar good at any time during the week on any Fort Wayne city lines—these passes being transferable—was through news items in the local daily papers.

Digitized by Google

Following this initial shot—this news being played up by all the local papers quite extensively on the first pages under big headlines—the corporation placed a half-page ad in all the papers. This announcement read:

"THIS IS THE WEEKLY PASS.

"Indiana Service Corporation.

"Weekly Pass.

"Feb. 27 to March 5, 1922 (Inc.).

"Pass bearer on cars of the Indiana Service Corporation within the one fare limits of the city of Fort Wayne for a period of seven (7) days as shown by dates on the face of this pass.

"Pass must be shown conductor upon entering car and is good only for one (1) passenger.

"No. 3994. SAMUEL W. GREENLAND."

(S. W. Greenland, it might be noted here, is the general manager of the company, so is the person to sign the passes as indicated above.)

"Savings.

"If you ride twenty times per week your fare will be 5 cents. If you ride thirty times per week it will be 3.3 cents per ride.

"Why not buy a weekly pass and ride home to lunch. Get a hot home cooked dinner.

"It's cheaper than shoe leather, why walk to and from work? Buy a weekly pass—save time and energy.

"Why fuss every morning with that cold engine?

"Warm, comfortable street cars are ready to serve you at any time. The $1 weekly pass makes it convenient and economical.

"Money saved is money earned, buy a weekly card pass, save car fare and deposit the difference in a savings bank.

"Pass can be purchased from our operators.

"The weekly pass will save time in loading and relieve congestion.

"Transfers are unnecessary for passholders.

"Passholders may ride as frequently as desired and transfer to suit their convenience."

The foregoing advertisement appeared in the local papers without change several times during the week preceding the start of the new system.

During the second week the new system was in force the company used the following ad in all the papers in half-page space:

"WEEKLY PASS.

"The popularity of the weekly pass has been indicated by the sales during the sale period, from Friday to Monday inclusive, viz.: the first week 2,967 were sold and the second week 3,546, making an increase of 579.

"Some confusion has developed relative to transfers since the weekly pass has been put into effect.

"Transfers will not be issued to passholders and therefore it becomes absolutely necessary that all passengers paying cash fares or tokens must request their transfers when they board the car and at time of paying their fares; otherwise transfers will not be issued.

"To issue transfers after fare has been paid not only imposes a double duty on the operator, but very materially interferes with loading and unloading of passengers. Neglecting to get your transfer at the proper time only stimulates the forgetting habit and in turn often results in unpleasant controversies and misunderstandings. The operator with his many and ever changing passengers cannot be expected to know whether a transfer has already been issued; neither does he know whether you paid your fare by presenting a pass and therefore are not entitled to a transfer. Compliance with these instructions will prove to our mutual advantage.

"We solicit your co-operation.

"INDIANA SERVICE CORPORATION."

One other advertisement, also half page in size, which was a slight variation of the ad quoted above, was used in putting over the pass system with the Fort Wayne public.

That the publicity combined with the value of the system effectively "sold" the new system to the Fort Wayne public is indicated by the record of passes sold during the first month's operation of the system. Here is the record: First week, 2,967; second week, 3,546; third week, 3,517; fourth week, 3,722.

The officials of the company believe that when the system's value is fully appreciated by the general public the sales of passes will run up to 5,000 or 6,000 a week. It is the intention of the corporation to continue its newspaper advertising, using smaller space, though, than has so far been used and telling the real news of the pass system in these advertisements. It is believed that by showing by figures just how the use of the passes is growing and by telling specific instances of people who have found the use of the passes a big saving and who by using passes have been able to get home during the noon hours when they were formerly unable to do so, more will be done to popularize the pass than could be done by any amount of plain, unadorned urging of folks to buy the cardboards.

HOW THE *Journal-Gazette* ARTIST SAW THE PASS IN A PLAYFUL MOMENT

It is interesting to know that the adoption of the pass system on the Fort Wayne city lines of the Indiana Service Corporation has been welcomed by the operators of the cars—most of the lines are one-man car lines—and that the use of the passes has greatly expedited the loading and unloading of cars.

Passes are on sale by operators and conductors from Fridays to Mondays and are also on sale at the Alter Cigar Store and the Riegel Cigar Stores at the "Transfer Corner," where all the city lines meet, during the same period. The number of passes sold by the cigar stores is negligible, but by having the passes on sale at these stores the corporation gets more publicity for the stunt and this having the passes on sale there also has a psychological effect toward popularizing the use of the passes.

The newspaper advertising space used by the corporation was partly paid for in transportation. Each month the corporation settles up on a cash basis for the transportation used by the papers and the advertising it has used.

Express Service Defeats Jitneys

THE way to beat the attractive features of competing jitney service is to offer features equally or more attractive! That is the theory of the officials of the United Electric Railways, Providence, R. I., and it seems to be working out in their recent experiment of fast express service between Providence and Pawtucket.

For several years the passenger-carrying automobiles, jitneys and motor buses have been making heavy inroads into the revenues of the street car lines in and about Providence. There is a steady flow of traffic at all times between Providence and its near neighbor Pawtucket, a city of textile mills, about 4 miles away. Into this traffic the automobiles cut heavily. A veritable flock of jitneys throng the "Loop" at Providence and when they secure a load start off for Pawtucket.

On Jan. 16 the United Electric Railways inaugurated an express service and advertised it thoroughly by means of dasher signs and the press. Express cars leave each end of the line every ten minutes all day. They make stops to receive and discharge passengers only in the center of the two cities, running without stops outside of the congested district. They start just ahead of the local cars, and so make the run without delay.

The run of 4.1 miles is made in eighteen to twenty minutes, depending on traffic conditions. The fare is 12 cents. This is a little faster than the motor buses, which charge a 10-cent fare. The jitneys, so called, which are ordinary passenger touring cars, independently operated, make it in about fifteen minutes, but charge a 15-cent fare. As the jitneys do not start on any schedule time, but wait for a paying load, the regular ten-minute starting schedule of the railway offers a favorable factor of dependability.

White dasher signs 21 x 22 in. are carried on all the express cars. They have large red letters calling attention to the special service. These signs read as follows: "Ride on the cars between Providence and Pawtucket. Time-saving express service now in operation."

Officials of the United Electric Railways are enthusiastic over the results already secured. They assert that patronage on this line already has doubled.

Valuation of Public Utilities for Taxation*

An Outline of the Wisconsin Ad Valorem System of Valuation for Taxation Purposes Is Presented—Why a Rate Valuation Is Not Applicable as a Basis to Compute Taxes

BY EDMUND J. BRABANT
Public Utility Statistician Wisconsin Tax Commission, Madison, Wis.

GAS, electric and street railway companies in Wisconsin are paying in taxes approximately 25 per cent of their net income which would otherwise be available for interest and dividends. In 1910 these companies paid in taxes $548,500. For the year 1921 they were called upon to pay $2,473,000—four and one-half times as much as in 1910. The total assessed valuation increased from $58,749,635 in 1910 to $117,503,422 in 1921. The average rate of taxation has increased from .01125 in 1910 to .02106 in 1921.

The question is sometimes asked, "What is the use of taxing public utilities at all if the facts are, as commonly stated, that the public pays the tax? Is not this the same thing as taking money out of one pocket and putting it into the other?" The answer to this question, however, is quite obvious to anyone who will give the matter a little thought. Even in communities where the widest use is made of the service offered by the utility there remains a large proportion of the tax-paying public who make little or no use of it. Then it must be remembered that rural communities do not have as a rule an opportunity to obtain service. So that, if this property were exempted from taxation, the deficiency caused by such exemption, which would have to be met by increased taxation of other property, would fall upon all taxpayers, user and non-user alike. In my opinion all public utilities should be taxed, including municipally owned utilities. The failure to charge taxes against a consumer in the case of municipal utilities is unfair to all other taxpayers who are unable to obtain service.

Taxes in 1920 were more than ten times what they were in 1880, while the population of the state had merely doubled in the same period. To put it in another way, government cost each individual in this state in 1880 $6.92, and in 1920 $36.58. This, of course omits all federal taxation. Unfortunately the increases are not evenly spread between different years. That is in 1919 the increase over the previous year was 37 per cent. On top of this in 1920 there was another increase of 24 per cent. We are now enjoying what may be called a lucid interval, the increase of 1921 over 1920 being but 1 per cent. The average rate applicable to public utilities for the year 1922 will be $21.16 per thousand while in the year 1921 it was $21.06 per thousand.

The Tax Commission is not, of course, responsible for levying taxes. The Tax Commission is, however, responsible for valuations put upon the property of public utilities which it assesses, and must be held accountable to the owners and operators of these properties and to the public for valuations in accordance with law and equity.

The support for the activities of the state government is derived largely from taxes paid by these companies. There has been no levy upon the general property of the state for state purposes since 1913. Mill taxes paid to the state treasurer for education and highways, while often spoken of as state taxes, are not in fact used by the state government. The state merely administers these funds for and distributes them to the local units. The classes of companies valued and assessed by the tax commission with the amounts of valuation and taxes on each for the year 1921 are as follows:

ASSESSMENTS AND TAXES—PUBLIC SERVICE CORPORATIONS IN WISCONSIN, 1921

	Valuation	Taxes at .02106389
Railroads	$345,559,000	$7,278,816.75
Street railways*	74,085,000	1,560,518.20
Telegraph	4,825,000	101,633.27
Express	500,000	10,531.94
Sleeping car	1,600,000	33,702.22
Freight line	1,350,000	28,446.79
Improvement	375,000	7,898.95
Water, gas and electric	43,418,422	914,559.86
	$471,712,422	$9,936,107.98

*Includes gas and electric utilities operated in connection.

WHY A SPECIAL SYSTEM IS USED

The system in Wisconsin for the taxation of public utilities is known as the ad valorem system; that is, valuation is the basis for computing the tax. Most of the states of the union have a species of ad valorem taxation of public utilities, although a few, of which our neighbor, Minnesota, is one, seem to prefer the license fee system, that is, a tax on gross revenue. Wisconsin discarded the license fee system about twenty years ago. The trouble with the system in this state was that there was constant complaint that public service corporations were not paying their proper proportion of taxes. Attempts to increase the rate of the license fee met with determined opposition on the part of railroad companies. They claimed that in view of the fact that intangible property, consisting of

*Abstract of paper presented before joint meeting of Wisconsin Gas Association and Wisconsin Electrical Association, Milwaukee, Wis., March 23, 1922.

Digitized by Google

stocks, bonds, mortgages, bank deposits, and money, practically escaped taxation, that the railroads in comparison, when taking into account this property, were paying more than their share of taxes under the license fee system. The failure of the attempts in the Legislature to increase the license fee over 4 per cent, which was then being paid as a maximum, resulted in the adoption of the ad valorem system. It was felt that the only way of putting public utilities and other property on an equal basis for taxation was to apply so far as possible the same methods in their taxation. So valuation became the basis for these properties as well as the general property of the state.

The word "valuation" as applied to the property of public service corporations in this state, as well as in several other states, requires explanation, interpretation and qualification. It is clear that the word as used in our laws does not always carry the same significance. The statutes require valuations to be made for several different purposes:

1. Taxation.
2. Rate making.
3. Purchase by municipalities.
4. Capitalization.

The statute specifically requires that the property and franchises of all these companies are to be assessed at "true cash value," but you will look in vain to find any direction as to how this true cash value is to be ascertained. While the statute lists a multitude of data which must be reported, it does not specify which are most important or significant, or what is to be the basis of the valuation. Neither does it require a classification of the properties included in the valuation. For example, no separate classification is required of tracks and cars in the case of electric railways, or of the generating plant, transmission lines and distribution systems in case of gas and electric plants.

The law with reference to the assessment of real and personal property is somewhat more specific. As to real property, the statute directs that it shall be assessed "at the full value which could ordinarily be obtained therefor at private sale." This has been construed by the Supreme Court to mean not such price as would produce a purchaser, for that would manifestly be a forced sale, but such value as could ordinarily be obtained by an owner assuming that he desired to sell, and that there was a purchaser with means desiring to buy.

Franchise and Going Value

Undoubtedly among the reasons for placing public service corporations in a special class for valuation and assessment is that under the law they enjoy special privileges, among which are right of eminent domain and in most cases virtual monopoly, these being inherent in the nature of the business. These rights and privileges may and often are of considerable value over and above investment in property. In other cases, they seem to be worth little or nothing. The statute specifically requires that value of franchises, if there is such a thing, be included. Furthermore, the system set forth in the statute evidently contemplates that these companies shall be valued as going concerns, and not as so many parcels of real estate and items of equipment. In fact, it must be admitted by every one that a street railway, electric or gas plant, is something more than mere land, rails, cars, wires and machinery. It is a live, going business, guided by brains and having rights and privileges which give it an organic unity. The theory of our ad valorem tax law as applied by the Tax Commission was upheld by our Supreme Court in an exhaustive opinion involving the first valuation for assessment purposes of railways (Chicago & Northwestern Railroad vs. State, 128 Wis. 553).

The meaning of the word value as taken for tax purposes is market or exchange value. Now, in putting a price on a parcel of land, a residence or business block, the customary manner is to ascertain at what figure similar properties have sold. Such value in the long run is based on the opinion of the public, or more particularly, persons who stake their money back of their judgment. There is no better guide than this to market value. It is the basis of the method employed by the commission in fixing the value of real estate in the state equalization. Unfortunately for the Tax Commission, the larger public utilities, unlike other properties, are rarely sold as units. When transferred, it is usually by the sale of stocks and securities. Where these are quoted on the market, they afford one means of determining value. This method would be sufficient and adequate without other data perhaps were it not for the fact that as only a portion of the stocks and bonds of a given company are sold in any one year, it is questionable whether prevailing prices would hold in case a controlling interest were offered for sale. Besides this, the securities of any public utility usually represent not only property useful in the public utility business but also investments made in securities of other corporations and other investments having no relation to the public utility business. For these reasons, additional methods must be employed for comparison and verification even where the data are available. They are, in fact, not available for most of the street railway and electric companies assessed by the commission.

Capitalization of Net Earnings

This method is based on the same theory that obtains in valuing annuities; that is, that the capital value of a given annual income may be computed, providing the length of time such annuity is to run is known or can be approximated. Now earnings of public utilities, unlike annuities, are not uniform. They fluctuate from year to year, depending upon a variety of circumstances, management, markets, labor, local conditions, and the general trend of business. Furthermore, it must be kept in mind that it is not past earnings which really give value to these properties, but the value of future earnings, and this means earnings over a period of years. Of course there is no way of measuring future earning capacity except by past performance. The period taken has usually been five years. Averages of net earnings are computed and capitalized at various rates.

Rates of Capitalization

The rates of capitalization employed being based on the rates demanded by the investing public necessarily cannot be uniform as to all classes of public utilities, nor even as to companies of the same character. Regularity, uniformity and stability, as well as amount of earnings, have an important bearing on the rates expected by investors. As a general rule the larger the company the less fluctuation there is in earnings. For this reason, the large interstate railways have been put in a special class, and the lowest rates have been applied to them. These rates range from 6 to 6½ per cent. In assessing street railways and light, heat and power companies, the rates have ranged from 6½ per cent to 8 per cent, depending on the hazard of the investment and the stability of the enterprise. Last year, the rates used were somewhat higher and ranged from 7½ per cent to 8 per cent. In a few cases involving small plants even higher rates were used, it being apparent that the revenues were large, and future prospects unattractive.

Depreciation

In using this method, it must be borne in mind that, notwithstanding the rules of accounting prescribed by regulating bodies, there are marked variations in methods of financing and management, all of which affect net earnings as reported. It is therefore highly essential that in using this method of valuation the accounts should be looked into rather closely, in order to get at a correct statement of a net revenue. It would be manifestly unfair to capitalize the net earnings of a company as reported where no depreciation had been taken, as this would give entirely too high a valuation, as compared with the company which was taking a liberal amount. In practice the commission has added to or deducted from the net earnings of all companies assessed in order to put them on an equal basis in the matter of depreciation.

Investment

In the determination of valuation of public utilities for purchase, original actual cost, that is, what has gone into the property, has usually been considered a most significant factor. This

Digitized by Google

does not hold true as to valuation for taxation, for the simple reason that the original cost of a public utility does not necessarily represent its cash or market value any more than the cost of anything else represents its real value.

There has been no complete appraisal in recent years of the properties of public utilities in Wisconsin. From time to time the Railroad Commission makes appraisals for fixing rates, etc., which valuations are of course subject to examination by the Tax Commission. Our practice has been to take the last appraised value, and to add cost of improvements and extensions, and this is taken for the purpose of our records as the cost of reproduction of the physical property. The total cost of reproduction less depreciation of such properties as shown on our records is $107,311,467, and the total true value for assessment for the year 1921 is $111,444,229.

Non-Paying Properties

There are a good many cases where the commission has no data relating to stock and bond quotations, and where there are no net earnings to capitalize, as the companies are running at a loss. There were five street railway companies in 1921 which reported deficits from operation, and in addition to this there were several others whose earnings were so low as to be insufficient to meet taxes and interest. Where these companies are operated in connection with light, heat and power companies, they have an advantage in this state. This is due to the fact that in arriving at valuations on the unit property including the street railway any deficits which may be suffered from operation on the street railway are deducted from the net shown by the light, heat and power property. It is impossible to state separately what the exact taxes are on the street railways proper, where they are assessed along with electric and gas properties. Our computations indicate that the percentage of taxes to net earnings runs about the same as for electric light properties in the case of companies operating street railway systems separately. In the case of non-paying properties, it has been the custom of the commission to assess them at greatly below the cost of reproduction. We have endeavored to ascertain if there was any future for properties of this kind, and if possible, what the owners would be willing to sell them for.

Comparison of Valuation for Rate and Tax Purposes

From the inquiries which are occasionally presented, it is evident that many people are uninformed as to the methods used by the Tax Commission in arriving at the valuation of public service corporations. There seems to be an impression not uncommon that the valuation is based largely upon the cost of reproduction of the physical property. The principal basis for a valuation for rate purposes is the investment in or, in case this cannot be ascertained, the cost of reproduction of the physical property. The owners cannot be allowed and have not in well considered cases been allowed to earn profits on anything more than such actual investment or cost of reproduction. Their claims in some cases of a right to earn on what was formerly considered valuable franchises, good will, increases in land valuation or capitalization of earnings have been denied. But your rejoinder may be, "Is not this amount invested or cost of reproduction really the value of the property in view of the fact that these companies are absolutely limited by the state to nothing more than the fair rate of return which is fixed by the state?"

This seems somewhat reasonable, but let us look at what is meant by fair return. As stated before, the purpose is to allow a high enough return to induce capital to develop new enterprises of this character. It must be remembered that the state or federal government, while it limits the profits of public utilities to a "fair return," does not ordinarily guarantee that or any other return. If the public or the local industries do not take advantage of the services; if the cost of the service is more than was anticipated; if the business does not develop as was expected, it is the investor's loss. The state will not reimburse him. In any private enterprise, the ever present danger of loss is offset by the possibility or probability of attractive profit. The attractiveness of investments in private enterprise must, therefore, be offset to some extent in the case of public utilities. The possibility of loss in public service enterprises must be met by the same inducement. A rate of return must be allowed which will attract capital sufficiently to brave the possibility of loss. For example, suppose that investors were willing to take the securities of electric lighting plants already established and with business worked up, say at 7 per cent. They naturally would not be willing to go into new enterprises with additional hazards on the same basis. So, to attract capital, a margin over 7 per cent must be allowed by the rate making body. Suppose this margin is 1 per cent so that the return upon which the rate schedules are based is 8 per cent; that a given utility with business established does actually earn 8 per cent. What is the result from a valuation standpoint; that is, from the standpoint of the investor? There can be but one result, and that is, that the investment or the stock, if it coincides in amount with the investment, will climb above par; that is, it will command a premium in the market. This is what actually takes place. A fair return, therefore, is such a rate as will draw capital into established public service business plus such additional percentage as will invite capital into new enterprises along this line. Such a return when realized has the effect of increasing the actual or market value of the property. The actual or market value of the property, we will assume, was originally the same as the investment. At that time the valuation for rate and tax purposes should have been the same, but from that time on, with increases in business, it may never be the same again.

The foregoing indicates one of the important reasons why the same valuation cannot be used for rate making and taxation. There is, however, further reason. The purpose of a rate increase is, of course, to allow the utility a greater rate of return. The purpose of a rate decrease is to cut down the rate of return. A valuation fixed with these purposes in mind does not always work out as expected. There have been cases where rate decreases instead of cutting down the rate of return have tended greatly to increase the earnings and the rate of return upon the investment. In other cases, increases in rates have failed to increase the earnings or the rate of return. This has been found to be true recently in the case of street railways where people simply refuse to ride under the increased fares.

Another thing with reference to rate regulation should be mentioned. In this state it has been found impracticable to make wholesale changes in the rates of public utilities. As a usual thing changes are made only when a complaint or petition is filed either by the company or by a citizen. When these complaints are filed, there is usually a careful and comprehensive study made of the situation. It would be impossible to devote the necessary time to all of the utilities at the same time; to study all the varying conditions and to change all the rates. The Tax Commission, however, is required under the law to assess a large number of public utilities every year. The tax valuation can be determined with satisfactory accuracy in much less time than the valuation for rate making. It would seem from what has been said heretofore that it is unnecessary to argue that an increase in earnings increases the value of a public utility; that whenever the Railroad Commission makes a change in the rate of any particular utility, this sooner or later will have some effect upon the market value of the property.

From the foregoing discussion I think a logical deduction may be drawn: That the so-called "fair valuation" for rate making is a misnomer. It may be fair, but it is not strictly speaking a valuation at all but rather a finding of cost—investment—what has gone into the property. What we are trying to arrive at for taxation is what is the market value—the actual value—and that depends on what can be got out of the property.

Experiences Exchanged by Members of C. E. R. A. Engineering Council

Mechanical and Way Department Men Discuss Wheel Diameter, Electric Welding of Wheel Flanges, Contact Devices, Bearing Metal and Allied Topics at Toledo Conference

A NUMBER of pertinent engineering topics were thoroughly discussed at a round table meeting of the Northern Section of the C. E. R. A. Engineering Council held in Toledo on March 14. Besides the chairman, the meeting was attended by eighteen railway men interested in mechanical and way matters. The principal assigned topics on which the experiences of the different ones were exchanged pertained to the adaptability of 26-in. wheels for city and lightweight cars, the building up of worn wheel flanges by electric welding and the relative merits of the sliding contact shoe and the trolley wheel.

Small Wheels Satisfactory Under Light Cars

In the discussion on whether or not the 26-in. wheel is the proper size for city and lightweight interurban cars, it developed that practically all the representatives had used this size wheel and found it to be satisfactory. A. Swartz, Community Traction Company, was of the opinion that the 26-in. wheel was satisfactory under city cars weighing from 16 to 20 tons. E. B. Gunn, Western Ohio Railway, who has recently made some investigations along these lines, said that he was convinced that this type of wheel was practical for interurban service. The Cincinnati, Milford & Blanchester Traction Company and the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad have been using lightweight cars for some time equipped with 24-in. wheels with satisfactory results. On the former roads three lightweight cars for one-man operation were installed over a year ago and the 24-in. rolled steel wheels at the end of thirteen months continuous service showed but little wear, and in this time it has not been necessary to remove a wheel. The power consumption for these cars has been but 1.1 kw.-hr. per car-mile and the general maintenance has also been very low. The Cincinnati, Lawrenceburg & Aurora was also getting about the same results. After witnessing the demonstration of the new lightweight cars recently purchased by the Kentucky Traction & Terminal Company, Mr. Gunn stated that he was very enthusiastic over this type of car and expressed himself as being in favor of the 26-in. rolled steel wheel under this type of car.

J. F. Collins, Michigan United Railways, said that he had had no trouble whatsoever from 26-in. wheels under Birney safety cars. In regard to safety cars in general, agreements on several other points were reached, and the meeting as a whole favored double-end control for one-man cars. The question of whether or not one or two trolleys should be carried on the Birney and similar types of cars was settled in favor of one pole.

The conclusion reached was that the 24-in. wheel was thought inadvisable on account of the close clearance after wear followed by turning, but all agreed that the 26-in. diameter wheel was entirely satisfactory and practicable. The council accordingly recommended its use under lightweight interurban and city cars.

Steel Wheel Flanges Can Be Repaired by Welding

The discussion on the practice of building up worn flanges on rolled steel wheels by electric welding was rather limited. Mr. Gunn and Mr. Heckler were the only members present who had done this work on wheels in use on interurban cars. Mr. Heckler remarked that with one pair of welded interurban wheels he had had good success, but owing to local conditions it was too expensive a practice to follow. Mr. Gunn, in relating his experience with the Lincoln machine for building up flanges, stated that he had been doing this work for the past three and a half years with excellent success. In this time only three wheels have shelled. The machine is used on the regular trolley voltage, but some trouble is experienced from the voltage fluctuation. He is contemplating installing a direct line from the substation to the shop to eliminate this drop. Mr. Gunn attributed his success largely to the care and skill of his welder and he is also of the opinion that the type of machine he is now using is the best for this work. The maximum wear is obtained by placing the welded wheels under freight trailers after they have been taken from motor car service. The Western Ohio Railway is not only welding its own wheels but has also built up a number of motor car wheels for the Dayton & Troy Railway and the Dayton & Western Railway. No recommendations were made on this subject because experience in this line had been confined to a limited number.

The Sliding Shoe Versus the Trolley Wheel

A number of interesting points were brought out on the relative merits of sliding contact shoes and trolley wheels. Mr. Rankin, Community Traction Company, said the experience of his company was limited in this respect, but foreign cars entering Toledo were having trouble with the dewiring of sliders because it was almost impossible to adjust switch pans for the accommodation of both wheels and shoes. It is not feasible to use both types simultaneously on the same overhead system. Mr. Savage, Detroit United Railway, remarked that a steel sliding shoe of the company's own pattern and manufacture was being used on the entire system with the exception of one division. When worn out these shoes are scrapped, since they can be produced cheaper than they can be reclaimed. In two-car operation their life averages from 1,300 to 1,800 miles, while a trolley wheel in the same service gave about 400 miles. When using the slider, the trolley pole tension is adjusted between the limits of 15 and 20 lb. The practice of regularly greasing the trolley wire where the shoe is used has been found helpful in facilitating backing up and lessening the wear on both the slider and the wire.

On the Northwestern Ohio Railway & Power Company lines E. E. Johnson said the Chapman sliding shoe was being used with good success, the life of which averaged about 6,000 miles. Mr. Shyrock of the same company added that the use of this shoe had reduced overhead maintenance by about 30 per cent and had not caused any trolley breaks since its installation on all equipment has been complete. It is also the practice of this company to assist the slider in backing up by greasing the wire at the regular meeting points of cars.

There was general agreement that interurban roads would adopt the sliding contact shoe for all their equipment when the manufacturers are able to bring out a shoe that will meet all requirements, particularly that of successfully backing.

Special Bearing Metal Gives Good Results on Western Ohio

Following the discussion of the assigned topics, Mr. Gunn related his experience with the United Lead Company's Frary metal. The Western Ohio Railway installed four of these Frary metal bearings for test purposes in a passenger motor car on July 25, 1921. After making 40,000 miles each one had lost approximately 3 oz. in weight. Even with considerably less oil than is required by regular babbitt bearings, these bearings kept the axles polished and in good condition. In a 1,000-mile test run without any lubrication whatsoever, he said that the metal did not melt and run out but powdered out. After testing a few bearings of this type Mr. Savage said that he had ordered some fifty more for the purpose of making his test more conclusive. He was of the opinion that the use of this bearing metal would wipe out their bearing trouble entirely.

Helical gearing also came up for comment. The subject was closed with the general conclusion that helical gears had no particular advantage over the older type, and in fact a number of the representatives showed preference for the straight spur gears and pinions.

In response to an inquiry by one of the representatives as to the average rate at which bonds could be installed, it was brought out that one type of machine operated by a crew of three men had a capacity of about sixteen bonds per working hour. It was the

Digitized by Google

experience of Mr. Gunn that about seventy-five bonds could be placed in a day by one operator using a Lincoln type bonder and welder on a push car. When using a freight or passenger car the train crew assisted in the work so that an average of from 300 to 350 bonds per day could be installed.

Rail Cars Finding Place on Steam Railroads

New York, New Haven & Hartford Official Gives Operating Experience—Three Cars Now Making Almost 350 Miles Each Day

IN a paper on Australia and its railways, F. M. Whyte, at the February meeting of the New York Railroad Club, explained that motor cars with internal combustion engines were being used there successfully on lines of light traffic. Such cars seem to be favored for service on outlying sections where traffic is not only light, but where fluctuations in demand are not wide.

The need for extensive experimental development in the rail car was pointed out by W. L. Bean, mechanical assistant New York, New Haven & Hartford Railroad. Mr. Bean said that the automotive industry must venture considerably and be willing to develop vehicles of greater capacity, speed and comfort.

Three rail cars are now operated on the New Haven property, with the results shown in the table. One of the cars, which seats thirty-five passengers, went into service Jan. 3, and makes two round trips on a branch 15 miles long. The speed between terminals, including three stops, is 25 m.p.h. The average of 1.2 minutes delay per trip is considered not excessive for breaking in a piece of equipment of radically new design, especially in midwinter.

The second car is operating on runs which require speeds on various schedules from one end of the line to the other from 19 to 23 m.p.h. This car runs, with frequent stops, over grades up to about 1 per cent for considerable stretches and over a very crooked line.

A third car went into service on Jan. 3 and until Jan. 30 made only about 20 miles a day. Since then it has averaged 146 miles a day, on schedules that range from a speed of 20 to 26 m.p.h.

In concluding, Mr. Bean said that the New Haven experience gave its officials confidence that there is a large economy available through gasoline rail equipment. The development should be rapid and along good engineering lines in order that there may be no serious setback and that no one gets loaded up with unsatisfactory equipment. The need for unit cars is impressive, particularly on branch lines, where engines are kept under steam, frequently from one washout period to another, and only make 30 or 40 miles per day. The field of economy is great if a rail car can be developed that will compare with a motor truck on the highways in reliability, in the saving in fuel, in the saving in wages and in the saving in attendance other than operating wages, to say nothing of possibilities in maintenance cost reductions.

RAIL CAR OPERATING DATE, N. Y., N. H. & H. R. R.

Difficulties Confronting Electric Railways in California*

Short Franchises, Heavy Taxation, Paving Burdens and Unfair Automobile Competition Delay Electric Railway Development—Public Opinion Becoming More Favorable to Electric Roads

BY W. V. HILL
Manager California Electric Railway Association

THERE are thirty-four electric railway companies in California operating 3,140 miles of single track with 5,736 cars and employing 17,544 men. The investment in these properties is approximately $350,000,000. Their gross receipts in 1920 were close to $50,000,000, and their deficit for that year was $1,244,337, according to the report of the Railroad Commission. During 1920 they carried 624,991,946 passengers. California ranks fifth in point of mileage, cars operated and passengers carried on electric railways.

When the electric car replaced the horse car it succeeded to all of the obligations incurred by its predecessor with compound interest, including the obligation to pave and repave the tracks and for 2 ft. on each side thereof. With the advent of the automobile and trucks, the expense of track construction has grown from $5,000 a mile during the early days to $143,000 per mile in some of the cities in California. Notwithstanding the tremendous increase in this and in all other costs of operation, the little old nickel carfare that was charged thirty years ago is still doing duty in San Francisco and on one of the lines in Los Angeles.

FRANCHISES ARE BURDENSOME AND SHORT LIVED

With the exception of Oakland, the franchises in the larger cities are limited to from twenty to twenty-five years. In San Francisco the city reserves the right to take over the property without payment therefor and has taken over some of the lines and paralleled others. In Los Angeles the city agrees to pay for the property if it desires to take it over at the expiration date. You can appreciate the difficulties of financing a property of forty or fifty-year bonds with franchises that run about one-half of the life of the bonds and with all the uncertainties that are liable to arise, and have arisen, at the expiration thereof.

In addition to the paving charge, there are other obligations in the franchise. They vary somewhat to meet local situations, but the more important provisions are contained in all.

Take Los Angeles for example: Twenty-one year limitation; right of city to purchase; may grant extensions of three years; grantee must pay 2 per cent of gross receipts to city (this in addition to state tax of 5¼ per cent); grantee must carry free on cars city officials, policemen, firemen and mail carriers (free rides on the Los Angeles Railway amounted to 4 per cent of the total travel in 1920); grantee must use heavy girder rail and track construction, including paving, in accordance with plans and specifications of the City Engineer; grantee must give transfers to all lines operated, and a 5-cent fare is stipulated. The Railroad Commission, however, has been vested with jurisdiction over fares. There are requirements to build culverts at street intersections where curve tracks are constructed; there are restrictions as to the kind of cars used, the service performed, the hours service must be performed and many other minor restrictions. These are a few of the requirements to which a company must agree when it accepts a franchise to operate an electric railway.

Is it surprising that the electric railways have failed to keep abreast of the development of this wonderful state? I think I speak conservatively when I say that there should be 5,000 miles of electric lines in operation in this state today properly to care for the transportation needs of the people.

There should be a drastic change in our system of granting franchises and this power should be vested in the State Railroad Commission. It is too large a problem for the average city hall politician to handle; it is a state problem, for after all most of the electric railways operate in more than one city. The Pacific Electric, for instance, operates in fifty-two incorporated cities and towns. Just imagine conforming to the different franchise requirements of these municipalities. It reminds me of the conflicting ordinances in Los An-

*Abstract of address presented before California Real Estate Association, Los Angeles, March 25, 1922.

Digitized by Google

geles and Pasadena relating to smoking on cars. A passenger wanting to smoke on a car operating in and between these cities is required to start smoking on the front end in Los Angeles and go to the rear end when reaching Pasadena. I expected South Pasadena to require smokers to sit in the center of the cars, for they never could agree with Pasadena or Los Angeles on anything as a rule. The Railroad Commission now has jurisdiction over fares, rates, service, finances, accounts, extensions and abandonments of electric lines, and in order to work out these important problems it should have jurisdiction over the granting of franchises, for after all the franchises are the foundation of the structure, and unless that is made secure it will be impossible to finance further extensions, and the officials responsible for these properties have already come to the conclusion that they cannot hope to place them in a sound financial condition and render adequate service to the public until the franchise problem is remedied.

Bus and Auto Truck Competition Is Serious

While the large number of privately owned automobiles are responsible to some extent for our loss of revenue during the past six or seven years, yet we do not feel we have any grievance with this class of competition, for the highways and paved streets were built by the taxpayers for this kind of traffic.

On the other hand we have some 800 companies and individuals operating about 2,500 large buses and trucks as common carriers over these highways (which we are being taxed to help build and maintain), doing a business estimated to be close to twenty millions annually—or about one-third of the gross business of the electric railways—destroying these highways without paying anything in the way of rental or taxes therefore, excepting a pittance of a motor vehicle tax, and nominal licenses imposed by less than 10 per cent of the cities and counties in the state. Of all the impositions ever placed on an industry, I consider this the worst. C. A. Whitmore, a member of the State Highway Commission, in a recent speech, clearly expressed the situation when he said:

> A peculiar paradox exists in California. We raise the money to meet highway bonds and interest from taxes on railroads and public utilities. With this money we build highways which are now used by automobile transportation lines in competition with the railroads. The competition reduces the revenues of the railroads and reduces the income which accrues to the state, with a part of which it builds highways. The state furnishes almost free a roadway for one common carrier out of money provided by taxation of another. Obviously this situation cannot continue. Highways cannot be maintained under circumstances like these.

Mr. Whitmore also stated that it was costing about double the amount per mile to care for the 5 per cent (trucks and buses) of the vehicles using the highways. In other words, they could build highways for $25,000 a mile that would withstand the traffic of 95 per cent using them, but it would cost $55,000 per mile to build highways that would withstand the other 5 per cent of the traffic.

The Highway Commission in its last report said: "The chief need for the heavier duty highway comes from the truck and auto passenger traffic. We believe that present laws should be amended to place a larger burden of maintenance cost on this particular class of traffic."

Public Sentiment Changing

A feeling is growing throughout the state that we have been given a raw deal by the taxpayers subsidizing our competitors with a free right of way and the non-payment of state taxes, and if this sentiment continues to grow, as reflected in more than a hundred editorials appearing recently in as many papers, we have hopes this injustice will be soon corrected. About one-half the county boards of supervisors and numerous chambers of commerce have petitioned the Railroad Commission not to grant any more permits where they compete with rail carriers, for it is now realized by public-spirited men that it has resulted in the impairment of service and in some cases the entire abandonment of lines, and that after all no community can thrive without a dependable transportation service.

So far these bus and truck operators have utterly failed to render as satisfactory service as that performed by the rail carriers, but have taken just enough revenue away from them to make it impossible for the rail carriers to maintain their former high standard of service and meet the demands of the public in making extensions in keeping with the progress of the state's development. Until the franchise burdens and the injustice of this subsidized competition are corrected the electric railways cannot hope to board the bandwagon with you again and take their rightful place in the future development of this wonderful state.

Technical League Prospers

THE Technical League of Milwaukee, which is one of the activities of the Employees' Mutual Benefit Association of the Milwaukee Electric Railway & Light Company, and was organized in December, 1919, reports that during 1921 its membership practically doubled. Meetings are held monthly in the Public Service Building, usually preceded by a supper.

During the year, out of seven papers read before the league, five were presented by company employees. The assistant general claim agent discussed the work of the claims department; the general auditor, that of the accounting department; the chemist, that of the chemical and physical laboratory, and so on. Other addresses were given by the local resident engineer of the Wisconsin Railroad Commission and a prominent banker formerly intimately connected with public utility work.

At the annual meeting prizes were awarded to a transportation department man for a paper on "Power Saving as a Factor of the Transportation Department Bonus," and for papers on "Electric Characteristics of the Electric Steel Furnace," "The Three-Truck, Two-Car Train," "My Job and I" and "Essentials of a Service-at-Cost Contract.

American Association News

Way Committee Holds Well Attended Meeting

THE committee on way matters held its second meeting for the year at association headquarters in New York City on March 29 and 30. In attendance were: W. F. Graves, chairman; H. H. George, vice-chairman; R. C. Cram, sponsor; C. A. Alden, V. Angerer, E. B. Entwisle, W. R. Dunham, Jr., C. F. Gailor, E. P. Roundey, E. M. T. Ryder, F. Tingley, W. W. Wysor, G. C. Hecker, E. J. McIlraith, H. M. Steward, W. C. Emory and F. A. Weymouth. The items covered are segregated below by subject assignments:

Standardization of Branch-Off Frogs and Car Clearance Curves—The proposed standardization scheme for branch-off frogs, as submitted in Plan B Appendix A of the 1921 report, was discussed. The general opinion was that this should not be approved. The proposed tables and data for car clearance curves presented last year as Appendix C was approved with addition of a drawing to assist engineers in making selections for varying street conditions. This material will be offered for approval as a recommended design. The tables are to be amplified with data covering the use of clearance curves for tracks of other than standard gages.

Proper Location of Tongue Switches in Turnouts, Crossovers and Branch-offs—Drawings were submitted and approved for adoption as recommended design.

Design of Curved Treads for Wheels and Study of Design of Flange and Tread Contours—These subjects had been combined to facilitate discussion with the committee on equipment. It was decided that a set of three flanges of different heights but uniform thickness be suggested for discussion at the meeting of the equipment committee on April 6. The view was expressed that treads should be at least 3 in. wide and that 2½-in. wide treads should be used only when conditions will not permit a wider tread. A suggested compound tread contour applicable to all treads regardless of flange depths was to be discussed with the equipment committee also. The object of this is to secure a uniform contour of contact

Digitized by Google

surface, more nearly in conformity with actual conditions found in the contact between worn wheels and worn rails.

Revision of Specifications for Girder Rails in Respect to the Method of Tests and Review of the Engineering Manual—An exhaustive study was stated to have been made of the manufacture of the steel test balls proposed for use with the modified impression test as originally suggested by the A. S. T. M. A slightly revised draft of the modified impression test was approved for adoption in place of the drop test. The manufacturers advised that they would continue to make the drop test or would substitute the impression test. Mr. Weymouth, for the A. S. T. M. subcommittee, stated his belief that the A. S. T. M. would accept the modifications proposed. A suggestion for change in the present specification for splice bars was also presented. The present specification will be set aside and certain A. S. T. M. specifications for splice bars are to be substituted. These cover all grades of hardness from the soft steel desired for use with seam welded joints to the high carbon bars of a nature similar to those provided by the existing specifications.

Designs of Substitute Ties—The subcommittee on this subject reported that it is preparing a statement of the controlling factors of design from data received.

Investigation of Arc-Weld Joints—The committee devoted detailed study to the design of a proposed machine for making an accelerated form of test of these as well as other joints. The manufacturers of welding equipment will be asked to devote their metallurgical studies to the question of the best methods of producing a satisfactory top seam. A statement was made to the effect that the committee on welded rail joints is compiling data from its recent questionnaire. A general meeting of this committee will probably be held late in April.

Wood Preservation—The sub-committee reported that some data from Europe are being gathered on the use of sodium fluoride as a preservative. Papers describing several timber treating plants of member companies are being prepared.

Review of Report of the American Committee on Electrolysis—Under this head there was some discussion of the definition of "stray currents." The matter was assigned for conference with the power distribution committee.

Specifications for Sundry Track Materials—On this subject the committee decided to suggest adoption of the A. S. T. M. specifications for tie plates, track bolts, ordinary hookhead and screw spikes. The specification for tie rods is to be considered further.

Dimension of Frogs—A set of angles and lengths for standard frogs used in turnouts in split-switch and tongue-switch construction was adopted for submission as recommended design.

Design of Track Construction in Co-operation with the A. S. M. I.—The sub-committee reported on correspondence had with a sub-committee of the A. S. M. I. It is hoped to arrange a joint sub-committee meeting soon.

Special American Association Reports and Compilations

THE following list of reports, which are available to members on request, has been issued by Executive Secretary Welsh.

Financial and Operating Statistics: Combined reports of approximately 175 companies showing complete income statement, operating expenses by departments, on various unit bases including operating and traffic ratios.

Motor-Bus Operating Costs: Gives operating figures for Chicago, Washington, D. C.; Lincoln, Neb., and a comparison of the relative costs of operation of motor buses, trolley buses and one-man cars.

Recent Official Valuations: Summary of commission decisions in valuation cases occurring since January, 1921, giving details of values found and the principles followed in determining them.

Fare Changes on Interurban Properties: Gives present fares in effect on interurban lines, changes that have occurred in past year and method of effecting change, *i.e.*, whether by increasing mileage rate, increasing zone rate, rearranging zones or other methods.

Depreciation Decisions: Summary of depreciation rates fixed by public utility commissions. This is a supplement to compilation of the same name issued June 1, 1921.

Metal Tokens: A list of companies using metal tokens, showing size of token and rate at which they are sold.

Printing Transfers: Showing companies that print their own transfers, number printed, type of transfer and cost of printing.

In addition to the above, supplements to the wage bulletin, the fare bulletin and the cost of living studies have been prepared bringing them down to date.

Help the Mail Pay Committee

THE Post-Office Department has recently mailed to all electric railway companies in the country that handle United States mail a series of forms calling for information necessary to enable the Interstate Commerce Commission to decide the petition recently filed before it, Docket No. 10227, by counsel for the committee on mail pay asking for increase in mail pay.

The American Electric Railway Association committee on mail pay has been in consultation with the Post-Office Department on this question, ironing out differences and reaching agreement on the method of procedure and scope of data needed. These efforts have been conducted for the department by Joseph Stewart, special assistant to the attorney general, and former second assistant postmaster general, and for the electric railways by L. H. Palmer, chairman, and W. H. Maltbie, counsel, of the committee on mail pay. The results are contained in the forms just sent out with a pamphlet of instructions.

Executive Secretary Welsh, of the association, has mailed to all companies copies of the petition filed with the Interstate Commerce Commission and two circular letters of explanation.

As the department desires operating data based on April, 1922, the compilation of the data called for on the forms cannot be completed until after May 1. As soon as possible thereafter, with the prompt co-operative efforts of the railway companies, an analysis and summary of the figures will be made and the case prepared for argument before the Interstate Commerce Commission.

Chairman Palmer states that the mail pay committee expects to develop some interesting and authoritative data on the relation between service provided as measured in seat-miles operated and the ratio of use of same. It hopes to show the costs of providing space for carrying mail both in pouches and compartments so that this difficult question may be solved once and for all. Finally the committee is sanguine that it can prove the inadequacy of the existing rates and the justice of an increase therein. None of these desired ends can be accomplished, however, says Mr. Palmer, without the co-operation of the mail-carrying electric roads in filling out the forms accurately, completely and promptly. Further work must be done in tabulating and analyzing the information after it has been forwarded to the Department and the counsel for the committee.

Merchandising Transportation

A MEETING of the committee on merchandising transportation of the T. & T. Association was held at association headquarters in New York on March 31. Those in attendance were E. M. Walker, chairman, Terre Haute; K. A. Simmon, East Pittsburgh; Victor S. Curtis, New Haven; W. H. Boyce, New Brighton, and J. B. Stewart, Jr., Youngstown, Ohio.

The meeting was devoted principally to deciding on the scope of the report for the October convention.

Busy Days for Committees

DURING the past week the Engineering Association committees on power distribution and equipment each held two-day meetings, largely attended, in New York City. The committee on purchases and stores was also scheduled to meet. Reports of these meetings will appear in a later issue.

Among coming meetings already scheduled is a two-day meeting of the buildings and structures committee, April 10 and 11, at Cincinnati, Ohio, and a one-day meeting of the committee on heavy traction, on April 19, at association headquarters.

Bacharach Bill Opposed

Public Opinion Aroused Over Measure Which Would Curtail Courts' Powers Over Commission Decisions

It would seem from the attitude of members of the judiciary committee of the House of Representatives that there is little chance of success for Representative Bacharach's bill to limit the jurisdiction of Federal courts in matters pertaining to state public utility orders. Still it appears likely that the bill will be vigorously sponsored. A further hearing on the bill will be held April 25.

In explaining the object of the legislation, Mr. Bacharach said:

> This bill seeks to amend the judicial code of the United States so as to compel utility corporations dissatisfied with the findings of the state utility commissioners to carry their cases through the courts of the state and then on to the Supreme Court of the United States if necessary. The enactment into law of this bill would not deprive utility companies of any of their just rights for they have every protection afforded them in the high type of men who compose the membership of the higher courts of the various states.

To enact such a bill as that proposed by Mr. Bacharach would be highly injurious to the public welfare, in the opinion of Everett T. Wheeler, of the Jurisprudence and Law Reform Committee of the American Bar Association. Among other things he brought this opinion to the attention of the committee:

> We often hear criticisms upon the writ of injunction from those who feel its effects, but in my judgment it is just as beneficial and important for the public welfare as the writ of habeas corpus. It prevents parties from taking the law into their own hands and provides for a continuance of existing conditions until a competent court has adjudicated the rights of the parties.

Former Senator Charles S. Thomas, of Colorado, says that he cannot conceive of any law that is more iniquitous than the legislation proposed. Mr. Thomas said:

> This bill is designed to reach a class of cases which will result from legislation existing or to be enacted in the future that will challenge the application thereto of such provisions of the Constitution as the fourteenth amendment. It seeks to deny to the Federal Courts the right to preserve the property and the rights of individuals pending the determination of the constitutional question and thereby in my judgment impinges upon the fourteenth amendment.

One of the most able of those who spoke for the bill was Clyde M. Reed, chairman of the Kansas Public Utilities Commission. This was the high point of his argument:

> It is not in the interest of public policy for the government to interfere where a body has been created under the state law for the benefit of the states laws and the state judicial bodies. If a constitutional question is involved, they can appeal to the Supreme Court of the United States.
>
> We have had in Kansas during the last eight or ten years a very large volume of litigation over these questions invoking the state courts and Federal courts and many of these cases have come direct to the Supreme Court of the United States. Usually the state power has been upheld but there has been a very considerable interference in the meantime by the lower Federal courts.

Paul V. Keyser, Des Moines, representing the Investment Bankers' Association of America, said that if the suggested legislation be adopted, it will affect very materially the value of securities already issued and outstanding. In addition, it would have a direct and immediate effect upon the credit of the utilities in respect to all additional capital requirements.

William Chamberlain, of Cedar Rapids, Iowa, representing utility companies in Iowa, Illinois, Indiana, Michigan and Tennessee, said in part:

> I think that it would be a serious thing to the finances and to the development of the utilities in the entire middle west to have a law passed which would take away from investors the protection of the Federal courts. I think that the result would be that in the financing of the utilities in the West you would practically drive away many millions of dollars which would otherwise be available for development.

Wage Reduction Accepted

Recently a wage reduction approximating 8 cents an hour for trainmen was placed in effect by the Pacific Northwest Traction Company and the Puget Sound International Railway, operating in Everett, Wash. The Pacific Northwest Traction Company operates the interurban line between Everett and Seattle and the Puget Sound International, the railway lines in Everett.

The old rate of wages paid trainmen by the Pacific Northwest was 58 cents an hour for the first year, 63 cents an hour for the second year and 68 cents an hour for the third year. The new rate is 50, 55 and 60 cents an hour. The present rate of wages on the city traction lines is 48 cents an hour for the first year, 52 cents for the second year and 56 cents an hour for the third year.

These reductions were accepted by the trainmen voluntarily following a conference with executive heads. This schedule prevails until 1923.

Traction Companies Will Save Through Centralized Plant

Power for all railway systems in Dayton, Ohio, soon will be supplied by the Dayton Power & Light Company. All but one of the five Dayton companies have been producing their own power heretofore, and in the case of this one exception, only part of the power was supplied. The Dayton power company some months ago secured a contract by which it will furnish all of the energy for the Indiana, Columbus & Eastern traction line. For a number of years it has supplied the Dayton & Troy, Dayton & Western, Dayton, Springfield & Xenia, and the Springfield and Xenia traction lines. In order to take care of these additional power contracts the company plans to spend more than $2,000,000 in extensions and improvements.

Election Result Awaited

Municipal Interests Planning Ahead, but Withholding Action Pending the Election

Little interest has been displayed in the railway situation by residents of Detroit, Mich., since the agreement was reached by the company and city officials regarding the purchase plan that will be voted on by the electors on April 17. The street railway officials are awaiting the outcome of the election before proceeding with their plans although little doubt is expressed that the purchase plan will be accepted by the voters.

While no financial statement has been given out for the year ending Dec. 31, 1921, covering the operation of the municipal railway lines, the revenues from operation have been satisfactory to the street railway commission and the municipal officials. The first municipal cars were operated over short sections of lines in February of last year and the first sections were put in operation for service only without the expectation of revenue until the lines were made into a more complete system by connecting the various sections. The crosstown lines have grown in importance until lines that at first showed receipts of only $200 a day are now producing $1,300 and $1,600 a day.

The opening of new city lines has changed somewhat the routes taken by some of the car riders and a study is being made of the traffic conditions with a view to determining future extensions in the way of branch lines and connecting links, to be constructed in carrying out the program of expansion. Schedules have been changed from day to day on certain lines to meet the requirements of the riders as they became accustomed to and used the new routes traversed by the M. O. lines.

While the proposed use of trolley buses in connection with the municipal system has not been abandoned, the commission has decided that no further steps will be taken to establish trolley bus lines until the more important problems pertaining to the main lines have been worked out so as to make the need of buses more evident. The idea of using buses has not been abandoned and new developments of importance are looked for in connection with trolley bus equipment. Gas buses are not looked upon with favor by the commission as it is believed that under the existing conditions on the lines contemplated gas buses could not be operated satisfactorily on a 5-cent fare. As noted elsewhere in this issue the municipal railway is preparing specifications for 200 Peter Witt cars with the idea of buying this new rolling stock if the city takes over the D. U. R. lines.

Scores City Jurisdiction—Commends State Regulation

N. W. Simpson, member of the Missouri Public Service Commission, in a speech delivered before the St. Louis Rotary Club on March 9 declared that if the people of St. Louis insisted upon a cut in electric railway fares, which are now 7 cents, they would have to "stand up for a slash in wages." He said that not only should the public utilities be permitted to earn a reasonable return on their invested capital, but they should also be allowed enough money on which to operate.

Mr. Simpson referred to the old days when politics played so important a part in readjustments, when a man who was running for office did so on the promise that he would have fares cut or gas rates reduced. He said that the commission had ended all this. Mr. Simpson said in part:

> When the cities controlled public utilities they did not do it properly. State supervision was the answer. Would the United Railways have so large an amount of stocks and bonds outstanding against it today if the State had been supervising its operations? Franchises cannot cover the relations of the utilites with the public. The commission is needed.
>
> The public is woefully ignorant on questions in which public utilites are involved and the cities were decidedly recreant to the trust placed in them. This trust never will be returned to the cities unless there is some absolute assurance that the control will be exercised judiciously.
>
> The hardest work the commission has to do is to undo the bungled job that the cities did when they controlled utilities. Trying to untangle these knots has put gray hairs in my head. The utilities want more money, the public wants lower rates and the investors want more dividends.

Commissioner Simpson flayed the city press for its misinformed criticism of the utilities. He said he had just read an editorial on a subject on which he happened to be well posted, and he found that the editorial writer knew nothing about the subject. He said that he suspected he was the man who had been writing certain other utility editorials.

Wage Controversy Settled

A wage agreement has been signed by the East St. Louis & Suburban Railway, East St. Louis, Ill., and its many members of the Amalgamated Association, ending a controversy that has lasted for a year and litigation which has been in the federal courts for several months. Under the contract the men get 51 cents an hour, until May 1, 1923. This is the same rate of pay they have been receiving pending the settlement. Up to July 1, 1921, the men received 70 cents an hour.

The employees demanded 65 cents an hour. After the men submitted their demand a board of arbitration was named. The arbitrator representing the company resigned before the board rendered a decision. The company then obtained an injunction restraining the board of arbitration from rendering a binding decision, as it attempted to do through the two remaining members, the union's agent and a third party. Since the injunction was granted the employees have been working at 51 cents an hour, and the contract just signed by President W. H. Sawyer, continuing the scale for thirteen months, has been ratified by the union.

Transportation Commission Reports

Sees Bright Prospect for San Diego Property—Transportation of Passengers Necessary Part of City Building

Declaring that the San Diego (Cal.) Electric Railway has a bright future if properly managed, and condemning some of the practices in the past of the company, the citizens transportation commission of San Diego appointed last fall by Mayor John Bacon, made its report to the City Council on March 27. Among the more important recommendations made in the report were suggestions that the city create a Public Utilities Commission, consisting of three members, one to be a paid executive, to supervise operations of all public utilities, but especially transportation; the consolidation of all transportation lines into one company; discontinuance of the 2 per cent municipal franchise tax; relieving the company of obligation to pave between car tracks after 1930; and that the company begin reconstructing its lines without delay. The commission also takes a stand against the zone system of fares, recommending that the 5-cent fare for all points between the bay and the eastern boundary of the city be restored as soon as the company's earnings justify.

A change in management of the company was recommended, which recommendation, the commission added, had already been complied with. The commission also opposes the plan whereby the J. D. & A. B. Spreckels Securities Company, owner of the railway company's stock in exchange for 2 per cent of the gross receipts, furnished the railway's operating and accounting staff.

The commission report says that the San Diego Electric Railway lost $15,000 in operating the Point Loma Railway in 1920, and broke even on that line in 1921. The San Diego company operates the Point Loma company's line at a rental of 10 cents per car mile and normal maintenance, for use of track and trolley. The commission also thinks the railway paid excessive charges to the San Diego-Coronado Ferries company when it paid $12,000 in 1921 for use of terminals at both shore approaches to the ferry. Both the Point Loma company and the Ferry company are owned by the Spreckels.

The commission commends the use of one-man cars for light traffic, and recommends the use of the auto bus for furnishing transportation to districts not sufficiently populated to justify the laying of tracks.

"Transportation of our people is as necessary and integral part of city building as gas, water, sewer, police and fire station service," the commission report states, and recommends that the interest of the city in the welfare of the company should not be sporadic or occasional, but constant, constructive, energetic and reasonable. The report says:

> These companies demand security for their investments and a fair return in interest. This is as it should be, but the other equation is the city's right to demand the greatest degree of efficiency and economy in the conduct of that business. The people should know that the men administering these public trusts are capable and honest and serving the public no less zealously than the stockholders. In the last analysis their masters are the people and the stockholders jointly and equally.

The commission pointed out that any extravagance in management, any waste, or any franchise tax or paving charge against the company, meant a higher fare to the commuters. The commission declared that the San Diego system is helping to pay for the building up of Tent City (Coronado line) and Ocean Beach (Point Loma line) resorts, and that this is unjust, and a fare should be charged on these lines to make them self-sustaining, thus aiding toward a lower fare on San Diego city lines.

$75,000 Saved by Want Ad

Car riders were saved $75,000 by a "want ad," according to officials of the Cleveland (Ohio) Railway, which has just won a damage suit for this amount.

The "want ad" was used to get information about lapses of consciousness suffered by Mrs. Helen Bachman, 5600 Hough Avenue, N.E., who sued the company for $75,000 as the result of an accident in which she was squeezed by the door of a Wade Park car on March 20, 1920.

Mrs. Bachman, who was wheeled into court, maintained that her condition is the result of the accident. During the trial Mrs. Bachman submitted to "pain tests," in one of which a bandage was slipped from her head, and she showed no sign of emotion when a doctor drove a needle into her arm. As soon as the bandage was replaced, she became apparently fully conscious.

After an article appeared, telling of the "pain tests" in the court room, one of Mrs. Bachman's neighbors reported to Cleveland Railway officials that Mrs. Bachman had suffered in a similar way before the accident.

The company placed a "want ad" in a newspaper asking for information from other persons who knew of Mrs. Bachman's condition. Several appeared in response to the "ad" and testified that Mrs. Bachman had suffered lapses of consciousness prior to the accident. The jury returned a verdict in favor of the company. The case was heard before Judge Maurice Bernon.

"That little 'want ad' saved the street car riders of Cleveland about $75,000 to apply on the fund that will help reduce the present rate of fare," says Paul E. Wilson, secretary of the Cleveland Railway.

Agreement Being Drawn to Provide Trackless Trolley

Counsel for the United Railways & Electric Company, Baltimore, Md., and for the Liberty Roads Improvement Association are preparing a formal agreement regarding the trackless trolley service from Gwynn Oak Junction to Randallstown. The association has notified the United Railways that the fund of $32,500, required by the company to protect it from operating at a loss during the first five years, had been raised.

As soon as the agreement is signed, the company will set about securing the necessary licenses and franchises, ordering the buses, and erecting the poles and wires. Three trackless trolleys will be purchased.

Under the agreement the residents of the section will guarantee the United against loss up to $10,000 during the first year of service, $7,500 during the second, and $5,000 during the remaining three years. By that time it is hoped that the territory will be sufficiently developed to support the line. A 14-cent fare will be charged on the line, and there will be no transfer privileges.

$575,000 Program of Improvements for Tampa

Increase of the Tampa (Fla.) Electric Company's capital stock from $2,879,800 to $3,454,800 to provide funds with which to finance extension and improvements to its property is proposed and a meeting of the stockholders will be held in Tampa on May 2 to ratify the decision of the board to go ahead with the improvements and to increase the stock for providing funds. Altogether $800,000 will be spent by the company in new construction, improvements and extensions, according to T. J. Hanlon, Jr., manager. Improvements include:

Construction of additional trackage on the Nebraska Avenue line to permit increased service. This is to include double-tracking of certain parts of the line so that ten cars may be operated on it. Additional turnouts and double tracks are to be installed in Jefferson Street from the county jail to Nebraska Avenue.

Track changes on the Union station line to permit of Birney car operation. This will include double track in Seventh Avenue from Twenty-second Street for a considerable stretch and will permit cars to operate on an eight-minute schedule during rush hours. In addition approximately 4 miles of new track will be laid on various lines about the city, double tracking present lines.

Purchase of twenty single-truck Birney cars for use on the Ross Avenue and Union station and Ballast Point lines, and for additional rush hour use on city lines. Ten of the new cars are to be delivered in July and the other ten in October.

Purchase of four double-truck cars for the Port Tampa line.

Additional storage and repair facilities to take care of this new rolling stock.

Establishment of substations in Gary and Sulphur Springs from which the supply of electrical current will be distributed.

Installation of a 600-hp. boiler and boiler accessories, pumps, etc., at the West Jackson Street power plant, which will make the sixth power unit at this plant.

Construction of a new store room and employees' room on part of the vacant property at the West Jackson Street plant.

One of the most important features of the program of improvements is the plan to place underground the light and power wires and cables leading from the east cable house at Whiting Street to remove danger of interruption of service from high water in the cable house or from fires in the lower down-town district. This item will cost approximately $300,000.

Labor Statistics Published

The *Monthly Labor Review* for February, 1922, contains a summary of a report by the Joint Commission of Agricultural Inquiry, which was created during the summer of 1921 to investigate agricultural conditions in the United States. According to the summary the inquiry covered "the condition of agriculture and the factors which caused it, the adequacy and effectiveness of the credit machinery and resources of the country transportation and marketing and distribution." A comparison is made of the average annual earnings of employees usually engaged in several of the leading industries in the United States for the years from 1909 to 1918, a comparison also of the value of these earnings at the prices of 1913 and their relative purchasing power. Included in the table are the following statistics on the average annual earnings of employees normally engaged in the electric railway, light and power, the telegraph and telephone industries.

Year	Current Money	Value at Prices of 1913	Indexes of the Purchasing Power of Annual Earnings. Base, 1913
1909	$623	$653	96.3
1910	638	653	96.3
1911	641	652	96.2
1912	652	656	96.8
1913	678	678	100.0
1914	683	676	99.7
1915	666	647	95.4
1916	732	665	98.1
1917	790	613	90.4
1918	878	556	82.0

Augusta Matters Unchanged

The situation in Augusta, Ga., has remained practically unchanged since the Augusta-Aiken Railway & Electric Corporation took its cars from the streets on March 16. The City Council at its last meeting referred the matter back to the committee on traffic and transportation. It appears now to be generally recognized that affairs are reaching a point where some constructive action will have to be taken soon.

Efforts have been made by city officials to regulate the jitneys, which are now the only means of transportation. There is some dissension among the jitney operators themselves in regard to the present situation.

Will Investigate Monthly Pass.—The Public Utilities Committee of the City Council of Seattle, Wash., has asked Superintendent of Railways D. W. Henderson to investigate the success of the monthly pass system in use on the Youngstown (Ohio) Municipal Railway.

Progress Seen in Trackless Trolley Plan

Such progress has been made in adapting a Brill trackless trolley for the Minneapolis (Minn.) Street Railway that the starting of its use on the Bloomington Avenue line from Thirty-eighth to Fortieth Streets is expected about April 15. Some of the changes made for the Minneapolis car, which is likely to be standard hereafter due to the logic of the development is a 36-in. wheel instead of 34-in., thirty seats instead of twenty-eight, one steel trolley pole instead of two of wood, a track shoe by which the car may be operated back to the company station from the end of the line.

T. Julian McGill, vice-president of the railway, believes from experiment that a trackless trolley must be constructed so that it will fit into all operations of the trolley system, otherwise it will be a mistaken policy to adopt use of such equipment. This car may be operated at a maximum of 12 ft. from the tracks in operation over the regular trolley routes back to the station, where emergency may require a detour to be made to avoid an obstruction.

The steel trolley pole with twin wheels to fit the double wire is believed to be an improvement of the original plan for a double wood pole. The company is operating successfully a motor bus as a crosstown line from the end of the Second Street line N.E. to the end of the Fremont Avenue line N., intercepting the Camden place line en route.

Plan for Removal of Traffic Danger Suggested

Los Angeles, Cal., will be 3½ in. above the danger mark in traffic accidents if the plans of a member of the Greater Los Angeles traffic commission are adopted. These plans are now in the hands of the commission for investigation. They provide for safety "islands" 3½ in. above the street, 30 ft. long, and surrounded by 18-inch lamp posts. These "islands" would be placed at each street intersection where cars stop, and would eliminate the possibility of automobiles driving into the space designated by the traffic department for boarding street cars. Another plan involves the erection of curbs 6 in. high at street intersections, running parallel to the direction of traffic, to guide four streams of traffic, two in each direction. This plan, if adopted, would eliminate the possibility of autoists crowding into streams four and five abreast and imperiling lives of pedestrians who must use the street intersections.

Los Angeles now has from 80,000 to 100,000 automobiles tributary to the congested district, and the registration for 1922 in California exceeds 700,000 automobiles, and it is estimated at least one-fourth of these will be seen on the streets of Los Angeles.

Taxpayers' Appeal Taken Under Advisement

Seattle's Municipal Railway controversy came one step nearer settlement recently when the Supreme Court of the State took under advisement the appeal of the "fourteen taxpayers" in their suit to enjoin the city from invading the general tax fund for operation and maintenance of the railway. The case was heard by the Supreme Court, en banc. Attorneys for the taxpayers contended that the city was under no obligation to tax the city generally for operation and maintenance of the street railway or to retire the $15,000,000 bonds which the city gave for the purchase of the system; that the city had no power to levy a general tax for such purpose, but that it was intended to tax by directing a portion of the general fund to the operation and maintenance of the railway. Counsel for the city of Seattle contended that the city was under no obligation to tax, but that it has the power to tax, although it has no intention of so doing.

George T. Donworth, appearing as a friend of the court, a citizen of Seattle and of the State of Washington, argued that the statutes and the constitution provided against the creation of a general indebtedness for the operation of the street railway system except by popular vote, and that no such vote had been held in this case.

Plan to Resume New Orleans Negotiations

Security holders of the New Orleans Railway & Light Company, New Orleans, La., are ready to proceed with a settlement of the company's troubles on the same basis proposed last November. This was the declaration of C. C. Chappelle upon his arrival in New Orleans to represent the security holders. He will be followed in a few days by G. M. Dahl, vice-president of the Chase National Bank, and a final settlement of the problem is expected to be reached shortly after his arrival.

Mr. Chappelle is quoted as follows:

The city of New Orleans and its people are to be congratulated that the recent decision of the Supreme Court of Louisiana establishes home rule in reference to regulation and control of its local public utilities.

The city now has full power and authority to dispose of its utility problems upon constructive and permanent lines.

I am here to co-operate, as in the past, with the Commission Council to reach an understanding whereby the New Orleans Railway & Light Company can be reorganized into a new concern—a New Orleans institution, which can be financed and kept financed through the years to come, adequately to serve the public at reasonable rates.

We were in substantial accord when negotiations were interrupted last November, upon all matters vital from the city's standpoint—valuation, rate of return, limitations upon the issuance of securities, and upon disbursements to existing securities—hence, it would seem matters should be concluded speedily.

An enormous amount of legal routine and detail is necessary to bring about a reorganization. Therefore, an early and definite understanding between the city and the security holders as to the basis is essential to real progress.

The security holders, who will undertake the responsibility of reorganization, are ready to proceed and I have taken matters up with Commissioner Maloney.

The arrival of G. M. Dahl, vice-president of the Chase National Bank, in New Orleans, La., is being anxiously awaited by the members of the Commission Council so that the conference which was interrupted by action of the Supreme Court last fall may be resumed. The members of the Commission Council are ready and willing to begin where they left off in the conference as soon as it is agreeable and convenient for Chairman Dahl to do so. Meanwhile, however, all sorts of reports are afloat. The chief of these is that the Commission Council will oppose the rate of return of 7½ per cent on the valuation fixed by agreement and will insist on a lower rate of interest.

It may be stated authoritatively that these rumors are misleading. The only objection that has been voiced against the rate of return has been that of Mayor McShane, who has called upon the railway for certain data upon which he is alleged to base his opposition to the points already agreed to by the conferees. The other members of the commission are noncommittal and disposed to deal as fairly with the railway as they are with the public in general.

News Notes

Approve Queensboro Subway.—Committee of the whole of the Board of Estimate of New York, N. Y., has approved the tentative proposal for an appropriation of $4,000,000 for the Queensboro subway from Grand Central station to Eighth Avenue and Forty-first Street.

Company Claims Damages.—As a result of the Nova Scotia Legislature adopting the bill changing the "drive to the left" rule to "drive to the right," the Nova Scotia Tramways & Power Company, Halifax, N. S., has claimed compensation to the amount of $50,000. It is said this amount is necessary to change tracks, cars and snow sweepers.

Investigates Grade Crossings.—Investigation of grade crossings in Tiffin, Ohio, was ordered by the City Council on March 14, upon petition of a large number of residents. Safety Director George T. West was directed to probe conditions following complaints that rail crossings are left unguarded where there are no gates.

Examinations Announced.—The United States Civil Service Commission announces an open competitive examination for tax examiner specialist. The salary for this position ranges from $2,400 to $3,600. Receipt of applications will close on May 9. The commission also announces an open competitive examination for transitman on May 10.

Paving Suits Threatened in New York.—Borough President Julius Miller of Manhattan has disclosed that suits aggregating about $150,000 probably will be brought by the city of New York against the various traction companies operating surface lines to compel these corporations to pay for repaving and other repairs within the railroad area.

Meets on Wage Matter.—At Lima, on March 27, there was a meeting between B. J. Jones, receiver for the Ohio Electric Railway, which operates the Lima City Railway, and W. P. Anderson, J. C. Hutchinson and John Sweeney, arbitration committee appointed to adjust wage scale differences between the men and the company. A working agreement adopted last fall continues until August, but the wage scale terminated on Feb. 15. The men oppose a further cut in wages and ask for a slight increase. The committee ruled against any change.

Third Arbiter Selected.—Professor George W. Rightmire of Ohio State University, Columbus, Ohio, has agreed to serve as the third member of the board of arbitration which is endeavoring to settle the wage dispute between the Indiana, Columbus & Eastern Traction Company, Cincinnati, Ohio, and its employees. The other members of the board are C. W. Rich, Springfield, who was selected by the trainmen, and S. F. Hutchins, Columbus, selected by the company. These two agreed on Mr. Rightmire for the third member. The first meeting of the full board will be held at the company's office in Springfield on April 13.

Crews, 100 per Cent on Safety, Praised. — The Co-operative Welfare Association of the Louisville Railway and the Louisville Interurban Company gave a dinner and entertainment in honor of the motormen and conductors of the Brook Street car line who went through the month of February without a single accident. The festivity took place at "Safety Hall" at the Eighteenth and Walnut Streets carhouses. James P. Barnes, president of the railway, praised the efforts of the men and said that they were keeping up their good work for in the twenty-one days of March these same men had run 9,668 miles without an accident.

Fort Smith Awaits Settlement.—Meetings between the executive committee of the men and D. C. Green, general manager of the Fort Smith Light & Traction Company, Fort Smith, Ark., have brought no concessions whatever from either side. The company is standing firm on its proposal of a separate contract for powerhouse men and trainmen; a cut of 6 cents an hour in the basic scale for carmen, and an additional cut of 3 cents an hour for swing run carmen; and the existing scale for powerhouse men and carhouse mechanics. The men are holding out for their original propositions: First, the same joint contract that has been in effect; second, the same contract, with a provision that any change in car fare would automatically open the wage scale to negotiations; and third, arbitration of the whole matter.

Financial and Corporate

Rental Agreement Proposed

As Result of Court's Aid Readjustment Between I. R. T. and Elevated Will Go Before Security Holders

A tentative agreement has been reached between representatives of the Interborough Rapid Transit Company, New York, N. Y., and the Manhattan (Elevated) Railway which provides for a reduction in the 7 per cent dividend paid by the Interborough on $60,000,000, the fixed value of the Manhattan elevated lines, to 3 per cent for the fiscal year beginning July 1 next, 4 per cent for the succeeding fiscal year and 5 per cent thereafter. If the earnings of the Interborough system, subway and elevated lines, yield more than 4 per cent, the excess is to be divided between the two companies until the Manhattan again receives 7 per cent.

The agreement also provides for sacrifices by the Interborough. Its stockholders are to subscribe for $7,000,000 of new Interborough notes, and its bondholders are to waive the sinking fund charges to retire $160,000,000 of bonds. This waiver, which is expected to give the Interborough an additional $2,000,000 a year, the reduction in the Manhattan dividends, the money from a new issue of notes and other money to be gained by economies and new devices, will supply the Interborough, it is estimated, an average of $5,000,000 a year for five years. The Interborough has indicated that this sum would be needed to meet expected orders of the Transit Commission for increased service.

The agreement was the result of intervention by Federal Judge Julius M. Mayer, who appointed James R. Sheffield a trustee in bankruptcy of the Interborough Consolidated Corporation, the holding concern of the Interborough, to act as mediator.

The announcement that the Interborough would not continue to pay 7 per cent dividends to the Manhattan Company and the passing of two quarterly dividends aggregating $2,100,000 led to conferences between representatives of the Interborough and the Manhattan. No progress was made toward reaching an adjustment that would save the Interborough from a receivership. Two applications for a receiver have been pending before Judge Mayer and the time for their disposal was near.

Judge Mayer took charge of the matter in an extra-judicial capacity for the purpose of bringing the two groups together. The agreement must have the indorsement of the security holders of the two companies.

While the Interborough directors were trying to meet the financial difficulties of the company, Mayor Hylan introduced in the Board of Estimate a resolution calling upon the Transit Commission to declare the Interborough in default of its contract on the ground of inadequate service and to seize and operate the subways. The resolution also authorized Corporation Counsel O'Brien to proceed independently, presumably in the courts, if the Transit Commission did not comply with the board's mandate. The resolution, on motion of Comptroller Charles L. Craig, was referred to the committee of the whole for consideration.

The Interborough has also obtained a further extension upon the two applications for a receivership, one by the American Brake Shoe & Foundry Company and the other by the Continental Securities Company, the latter a minority stockholder action. The litigation involves an issue of $38,144,400 short term notes. Counsel for the Interborough said that only $721,000 of these notes had not been deposited for extension and Judge Julius M. Mayer of the United States District Court extended the time until April 28. He coupled with this order an additional order that any party in interest might apply for a receiver on an hour's notice.

Receiver Submits 1921 Report

Receiver O'Keefe of the New Orleans Railway & Light Company, New Orleans, La., has furnished Commissioner Maloney of the Department of Public Utilities with a report of the earnings for the twelve months ended Dec. 31, 1921. It makes a very good showing for the last three months of the year, when the population of tourists and winter residents was at its greatest.

The railway operating revenue for the year ended Dec. 31, 1921, was $8,845,876 and the expenses amounted to $5,790,269. The net operating income amounted to $2,322,354. The annual return based on the twelve months ended Dec. 31, 1921 and on proposed compromise valuation as of Dec. 31, 1920, was 6.1 per cent.

Surplus of $1,893 in Holyoke

At the annual meeting of the Holyoke (Mass.) Street Railway, on March 21, the directors were authorized to renew the lease of the Mount Tom Railroad, to expire in June next, on as favorable terms as could be arranged. The last lease was for twenty-five years at 6 per cent return on the capital. At the meeting Isaac E. Sawyer was elected a director.

Net earnings of the Holyoke Street Railway for the past year were $82,413, and after paying dividends at 6 per cent, amounting to $80,520, a surplus of $1,893 remained. Receipts and miscellaneous revenue totaled $1,104,250. Total operating expenses were $901,431, taxes $371,571 and interest $82,834, bringing total expenses to $1,021,836.

Buffalo Property Reports

International Railway Fails to Realize Fair Return—Traffic Falls Off—$3,000,000 for Improvements

The 1921 operating revenue of the International Railway, Buffalo, N. Y., last year was $10,721,279. This was insufficient by $1,186,562 to provide for maintenance, depreciation and renewals, operating expenses, taxes and a fair return upon the value of the property in accordance with a formula adopted by the Public Service Commission when it granted the 7-cent fare or four tokens for 25 cents for the city of Buffalo. This statement was made in the annual report of the company submitted to stockholders on March 28, 1922.

In brief the company sets forth that it inherited from horse-car days a continuing charge against its revenues for the paving of city streets. H. G. Tulley, president of the company, and T. E. Mitten, Philadelphia, chairman of the executive committee, contend in the statement that this charge is unreasonable and an unjustifiable burden upon the car-riding public and one that ought to be removed.

In touching upon service, the report says that 23,000,000 fewer passengers were carried in 1921 than in 1920. Schedules were adjusted to meet traffic requirements and unnecessary service was eliminated. This saving in operating costs offsets in part the loss in revenue. The report calls attention to the survey made in November and December by engineers of the Public Service Commission whose report recommended but 1 per cent additional service. The so-called old Buffalo and Niagara Falls line practically ceased to serve as a through route between these two cities when the modern high-speed line was placed in operation, according to the report which says that those sections of the old line between Buffalo and North Tonawanda and between Niagara Falls and LaSalle are needed for local traffic, but the intervening section between North Tonawanda and LaSalle parallels the high-speed line and represents wasted service, resulting in an operating loss of more than $150,000 per annum; this adding to the cost of transportation borne by the car riders, should, in the public interest, be eliminated. To avoid the expenditure of approximately $1,000,000 for municipal paving requirements and reconstruction of track, permission was requested and received from the commission, to abandon the line between North Tonawanda and LaSalle.

New working conditions affecting all hourly paid employees were adopted and made effective May 1, 1921, the report says, and adds that all rates paid employees working at unskilled occupations were adjusted to compare with those paid for similar work in the industries of Buffalo. The International Railway Company's Co-Operative Benefit Association was organized last year for the purpose of promoting true co-operation between men and manage-

Digitized by Google

ment, and to provide protection to employees in the form of $1,000 group life insurance certificates and sick benefits of $1.50 a day. The membership dues were fixed at $1 a month, the company contributing each month to the funds of the association a sum equal to the aggregate amount of dues paid by members. Nine death claims and sick benefits to 160 members have been paid during the year.

The report closes the first year's operation of the International system under the Mitten Management, Inc., contract. Valuation of the company's property has been prepared for presentation to support the proposed application for a system basis of fare. Industrial relations have been much improved and the Co-operative Benefit Association so advanced in membership as to represent approximately 80 per cent of all employees. The property, it is stated, has been brought to a better state of excellence, with lessened accidents, and the number of suits pending reduced from 1,486 to 778.

W. S. Dunbar, comptroller of the company, sets forth in his report that existing tariffs for transportation over interurban divisions show wide variations. These rates originated largely through agreements made between municipalities and previous managements, prior to the formation of the Public Service Commission. Some of the fares are inadequate, Mr. Dunbar reports, in that they do not pay for the cost of service rendered.

It has, therefore, been recommended that a review of the entire rate structure be made, and a valuation of the system property as a whole be presented to the Public Service Commission with an application for a general adjustment of the rates charged on the International system; this in order to establish reasonable fares conducive to the maximum use of the cars, and productive of an adequate return upon the total investment in the combined system property. The expenditure incurred through improvements and betterments amounting to more than $3,000,000 entirely consumed the appropriation made from 1921 earnings for maintenance and renewals and approximately $500,000 of working capital provided by the stockholders.

Seeks to Abandon Line

The Pacific Northwest Traction Company operating out of Everett, Wash., has filed a formal request with the Public Service Commission for permission to abandon its line between Everett and Snohomish, over which no cars have operated since December of last year. Floods late last year caused damage that would require an expenditure of $60,000 to repair, and this the company is unwilling to spend, in view of the fact that the line has been operated at a loss for three years. The line is about 7½ miles long, 2 miles of which is owned by the traction company, and the remainder is operated under a lease with the Northern Pacific Railway.

Middle West Utilities Makes Report

The Middle West Utilities Company, Chicago, Ill., for the fiscal year ended Dec. 31, 1921, reports a total income of $3,441,561 and a net income of $1,616,326. The combined surplus earnings for the year, including $493,978 the proportion of the subsidiary companies' aggregate undistributed surplus, totalled $1,207,407. The total gross earnings of the subsidiary companies increased from $22,729,923 for the year ended 1920 to $26,348,234 for the year just ended. The company's balance as of Dec. 31, 1921, was $813,048.

The company refers to its activity with new properties during the year. It makes mention of its acquiring control of the Hydro-Electric Light & Power Company of Connersville, Ind., and also of its securing a controlling interest in the Ironwood & Bessemer Railway & Light Company, the Ashland Light, Power & Street Railway Company and the Big Falls Water Power Company. The report also includes a statement on the status of the company's ten-year 6 per cent collateral gold bonds, the three-year 6 per cent collateral gold notes and the five-year 7 per cent convertible gold notes. During 1921 the company gained approximately 8,000 new stockholders and 5,000 subscribers who are becoming stockholders. This was accomplished through the company's issuing and selling $4,375,000 in par amount of its 7 per cent cumulative prior lien stock. In addition, $1,591,600 par amount of prior lien stock was sold on partial payment plan to be issued when fully paid.

York Railways Planning New Property Acquisition

Negotiations are now pending by which the York (Pa.) Railways will ultimately get control of the York Haven Water & Power Company, located on the Susquehanna River at York Haven. This company has been closely associated with the York Railways and has an operating contract with the Edison Light & Power Company, by which an interchange of water power and steam power is effected, enabling the successful operation and development of the water power plant which formerly suffered from shortages due to conditions on the Susquehanna River, resulting in deficiencies which are now supplied by the steam plant of the Edison Company.

The officials of the York Railways, who also control the Edison Electric Light & Power Company, have been in conference with two groups of bankers located in Philadelphia. The deal involves about $500,000 or about 27,000 shares of common stock now held by Brown Brothers & Company, who hold the controlling interest in the York Railways, and the Edison Electric Light & Power Company.

The York Railways operates 85 miles of electric railway and controls the Edison Light & Power Company, which does a large electric lighting and power business. If the deal is consummated it will combine the three corporations —the York Haven Water & Power Company, the Edison Electric Light & Power Company and the York Railways.

The York Haven Water Power Company has a funded debt of $3,760,000 and $3,000,000 of stock at par. The plant generates 20,000 h.p.

The negotiations are being carried on by Charles R. Rhoads, a member of Brown Brothers & Company; Day & Zimmermann, engineers of Philadelphia; Janney & Company, bankers; Charles H. Bean & Company, bankers, and the York contingent.

Should the deal be consummated, the entire operation will be controlled at York, with local management and with Gordon Campbell as the probable responsible operating official in the capacity of president.

Valuation Case to Be Concluded

With the presentation of testimony as to intangible values, cost of promotion, consolidation and other items, the United Railways, St. Louis, Mo., expects to complete its side of the case at the valuation hearing before the Missouri Public Service Commission at Jefferson City, on April 17. At the recent hearing this phase of the case was opened.

Robert L. Warner, a New York financier, former vice-president of United Railways and an official of the North American Company, testified that there should be an allowance of 10 per cent for going value, 10 per cent for consolidation of the old lines, 10 per cent allowance to cover the expense of financing, and 10 per cent to cover the cost of promotion.

Frank O. Watts, president of the First National Bank, St. Louis, testified as to the allowance for financing, and stated that from 5 to 10 per cent would be a reasonable charge. Breckenridge Jones of the Mississippi Valley Trust Company gave similar testimony. Col. Albert T. Perkins, manager for the receiver of the United Railways, testified that not less than 20 per cent of the reproduction value of the property would be necessary to pay for promotion and financing. "No large amount of capital can be collected for consolidation purposes in handling transportation corporations without large bankers' and brokers' cost," he said.

The tentative valuation fixed by the commission for rate-making purposes is $50,000,000. Representatives of the corporation and also the receiver expect to show that the value is not less than $75,000.000. Manager Perkins, in his testimony, said that many things entered into a valuation of such property as that of the United Railways, besides the actual physical value. He cited the contract the United Railways holds with the Keokuk water power dam. "Financed at 7 per cent," he said, "this contract would represent a value in excess of $16,000,000." And yet, a few years ago, this contract was under vicious attack by newspapers.

Stock to Be Issued to Cover Deferred Dividends

The directors of the Columbus Railway, Power & Light Company, Columbus, Ohio, on March 29 took the final step in the declaration of stock dividends on A and B preferred stocks and set March 31 as the date upon which the books will close. The dividend on A is 24.8 per cent and on B 2 per cent. The directors took the first step in declaring these dividends several weeks ago and their action was approved unanimously at a special meeting of the stockholders. Announcement was made that the stock dividend will be distributed as rapidly as the stock certificates can be made out.

The directors plan to hold a meeting about April 10 to declare a cash dividend on B. They will meet about June 10 to declare a cash dividend on A. The directors hope to pay a dividend on common later, but no date has been selected.

The Ohio Public Utilities Commission has approved the issuance of stocks of the company aggregating $1,288,996, so that the stock dividends could be paid. The commission gave its approval to the revocation of stocks and bonds of the company never disposed aggregating $774,900.

Abandonment Likely

Railway lines between Mechanicsburg, Carlisle and Cumberland County towns will probably be abandoned by the Valley Railways, Lemoyne, Pa., although some amicable arrangement is being sought. Residents of Carlisle have made a proposal which includes suspension of service on Hanover Street and the continuation of the present Harrisburg-Carlisle line to Cave Hill. The railway officials claim that the lines east of Mechanicsburg are the only ones which pay for operation and that eventually all lines west of Mechanicsburg will be abandoned. The company representatives will report the proposal made by the Carlisle people to the company's board of directors and will inform the Carlisle borough council of the directors' action before their next regular council meeting, April 13.

Ohio Traction Distributes Report

The first printed annual report of the Ohio Traction Company, Cincinnati, Ohio, to be submitted to stockholders was received on March 29. Heretofore the report has been read at the annual meeting, but no copies have been distributed among the stockholders. The report shows railway operating revenue for 1921 of $8,885,632, a decrease of $84,723. Net operating revenues were $2,979,695, an increase of $298,093. After taxes and rentals, excepting the franchise tax, there was a balance for the year of $1,079,232, or $298,093, greater than in 1920. Interest and sinking fund obligations took $686,117, leaving $393,115 available for return on capital, or $22,885 short of the amount of the allowance for capital return.

The report declares that the present rate of fare should be sufficient to provide the full return on capital for 1922. Passengers carried during 1921 showed a reduction as compared to the previous year, the number being 106,527,759, against 118,618,862 in 1920. The report estimates that there will be a surplus of $200,000 for 1922, which if realized will pay all but $133,000 of the accumulated deficit of the company under the service-at-cost ordinance.

The Ohio Traction Company owns practically all the stock of the Cincinnati Traction Company.

Seattle Shows Gain

Annual Report Shows Three Year Deficit of Municipal Railway Reduced to $1,526.869

D. W. Henderson, superintendent of the Seattle (Wash.) Municipal Street Railway has presented to Mayor Hugh M. Caldwell his annual report showing a gain of $378,824 resulting from operation of the railway system in 1921.

At the same time City Comptroller Harry W. Carroll made public figures showing that the deficit incurred from the operation of the railway for the three years since the Stone & Webster properties were purchased now stands at $1,526,869.

Mr. Henderson's figures of railway expense for the year include the large item for depreciation specified by the state accountants, $680,629, a book charge, while only $100,000 was actually set aside for depreciation. On the other hand, they do not include any monthly apportionment to meet the $833,000 annual payment to the owners of the system which was made on March 1, and which the Mayor has always considered in analyzing the financial condition of the railway.

Deducting the book depreciation charge from the total expense of the year, and adding the actual depreciation apportionment and the apportionment for redemption of bonds, the gain would be $326,453, it was pointed out.

SEATTLE MUNICIPAL STREET RAILWAY INCOME PROFIT AND LOSS STATEMENT YEAR ENDED DEC. 31, 1921

Operating revenues	$6,295,564
Operating expenses	5,105,487
Operating income	$1,190,076
Non-operating income	51,611
Gross income	$1,241,688
Deductions from gross income	866,846
Net income	$374,841
Losses accrued (other than income)	1,412
Income profit and loss income	$373,428
Delayed gains in prior period	53,133
Delayed losses in prior period	$202,673
Income profit and loss earned	$223,888
Unearned decrease of deficit by donations	2,700
Income profit and loss balance (credit)	$226,588

The operating expenses will check with the reports for twelve months of 1921 by adding $680,629 depreciation charge. $1,190 ground rental and the auto bus expense of $31,837, and deducting $12,079 which is an overestimated amount for industrial insurance.

Included in operating revenues are auto bus revenues of $16,964.

Fewer Passengers Carried

Superintendent Henderson's report showed that the total expense of the railway for 1921, including operating costs, depreciation and interest on bonds, was $5,951,385. The revenues for the year were $6,330,210. The municipal bus lines were operated at a loss of $14,872.

The total number of pay passengers carried on city cars during the year was 75,724,088, as compared with 98,824,369 in 1920, a difference of 22,916,386.

The report showed a marked decrease in the number of railway accidents. Car collisions decreased 106, collisions with automobiles decreased 433, derailments 125, and miscellaneous accidents 489. The total number of accidents decreased from 5,254 in 1920 to 3,972 in 1921, a difference of 1,282. The only increase reported was in the item of ejectments and disputes, which are listed as accidents, of which there were nineteen more in 1921 than in 1920. Such controversies between trainment and passengers in 1921 numbered 125.

Comptroller Carroll's figures varied somewhat from those of the superintendent. They credited the railway with a gain of $226,588 for the year, as compared with large losses during the two previous years. The loss in 1919 was $517,173 and in 1920 $1,236,283.

The capital assets of the railway, as shown by Comptroller Carroll's figures, on Dec. 31, 1921, were $15,205,588, the capital liabilities, $17,217,765, and the capital deficit, $2,012,176. The capital deficit, Mr. Carroll explained, is larger than the deficit for the past three years because of the deficit in the old municipal railway fund before the Stone & Webster properties were purchased.

Current assets of the railway, including materials and supplies and cash on hand, at the end of the year were $1,347,629, while current liabilities, including accounts payable and warrants outstanding were $922,901. The current surplus was $424,728.

In his calculations, Comptroller Carroll made the accompanying tabulation, comparing the three years of municipal operation of the general street railway system.

SEATTLE MUNICIPAL RAILWAY RESULTS

	1919	1920	1921	Total
Operating revenue	$4,114,885	$5,410,764	$6,295,564	$15,821,214
Miscellaneous revenue	43,268	52,628	51,611	147,507
Operating expense	4,067,902	5,585,301	5,105,487	14,758,691
Interest payments	607,424	865,660	866,846	2,339,931
Loss	517,173	1,236,283	.....	.....
Gain	.....	.....	226,688	.....
Deficit	.....	.....	.....	1,526,869
	1919	1920	1921	Total
Replacements and betterments	$ 193,217	$ 148,274	$ 146,074	$ 477,560

New York State Railways Shows Improved Earnings

The New York State Railways, Rochester, N. Y., has reported railway operating revenues for 1921 at $10,692,263 against $10,454,410 in 1920. Operating expenses including $762,087 for depreciation in 1921 increased from $8,369,558 in 1920 to $8,511,376 in 1921. The 1920 expense figure included a depreciation amount of $567,554. From a net income of $568,854 in 1921 sinking fund appropriations amounting to $34,074 were deducted leaving a surplus of $534,780 against a surplus $397,047 in 1920.

James F. Hamilton, president of the railways, referred to the company's property in Rochester being valued tentatively at $17,500,000 and being finally fixed by the board of appraisers at $19,216,000. He alluded to the fare questions in Syracuse and Utica and intimated that a further reduction in wages was likely at the expiration of the agreement ending May 1, 1922. In discussing the earnings of the company, Mr. Hamilton said:

> While the company has earned a substantial amount available for dividends, these earnings have had to be used for corporate purposes. Conditions have been such as to prevent the sale of bonds for the refunding of bonds of the People's Railroad Company of Syracuse and of the Rochester City & Brighton Railroad aggregating $925,000, which when they became due had to be taken care of by issuing notes discounted at the banks.

In concluding his remarks to the stockholders Mr. Hamilton said the earnings were improving and he looked to the time when bonds would be sold to refund indebtedness and to reimburse the treasury for a certain amount of the expenditures on capital account which had been made from earnings. He was of the opinion that when this was effected it was to be expected that dividends could be resumed on the preferred stock and payment made on account of the dividends which have accumulated on that stock since 1918.

Receivership Lifted in Des Moines

Harris, Forbes & Company, New York, announce that the Des Moines (Iowa) City Railway, having completed arrangements for the satisfaction of its outstanding matured obligations, the properties of that company, for more than three years in the hands of receivers appointed by the United States District Court, by order of the court, have been turned back to the company. The company is now operating under a new franchise under which the rate of fare to be charged will be automatically changed from time to time, according to the costs of operation.

The bondholders' protective committee, representing the general and refunding mortgage 5 per cent bonds, due 1936, announces that upon presentation of certificates of deposit the bonds will be returned without charge to the depositing bondholders, together with interest due July 1, 1921, and Jan. 1, 1922, plus interest on overdue interest. Non-depositing holders may collect their overdue interest in the usual manner.

Financial News Notes

Valuation Fixed for Reorganization.—The valuation of the properties of Buffalo & Lake Erie Traction Company outside the city of Erie, Pa., has been fixed at $775,000 for reorganization purposes by the Pennsylvania Public Service Commission.

Increased Gross Earnings in Chicago.—Gross earnings of the Chicago (Ill.) Surface Lines increased from $55,016,348 in the 1920-1921 period to $60,343,733 during the twelve months ended Jan. 31. The total cost of operation amounted to $46,516,150 leaving $13,827,583 to be used for interest and surplus.

Approval of Security Issue Sought.—The Lafayette (Ind.) Street Railway, Inc., has petitioned for authority to issue $250,000 of stock, half to be preferred. The company bought, under federal court jurisdiction, the local railway property for $75,000. The petition says the company will buy new cars and improve the property.

Balance Decreases.—For the twelve months ended Feb. 28, 1922, the Republic Railway & Light Company, Youngstown, Ohio, reports gross earnings of $7,213,677, against $8,464,315 for the same period a year ago. The total income realized was $2,403,676, from which deductions amounting to $1,978,603 were subtracted, leaving a balance for depreciation, dividends, etc., amounting to $425,074, against $438,816 for the twelve months ended Feb. 28, 1921.

Gold Bonds Offered.—Halsey, Stuart & Company, Inc., and A. B. Leach & Company, Inc., are offering $1,000,000 of the American Public Service Company's first lien 6 per cent gold bonds due Dec. 1, 1942. The price of the bonds is 89 and interest, yielding about 7 per cent. Coupon bonds are offered in denominations of $1,000, $500 and $100. The American Public Service Company is controlled through stock ownership by the Middle West Utilities Company.

Passenger Revenue and Traffic Decrease.—For the two months of operation ended Feb. 28, 1922, the Philadelphia (Pa.) Rapid Transit Company realized a net income of $350,876 against $146,362 for the same period a year ago. The passenger revenue for the two months amounted to $6,446,479 a decrease of $246,494 over a total of January and February last year. The passengers carried totalled 130,660,707 for the two months of this year against 134,239,820 in 1921.

A Larger Surplus than Ever.—After all deductions the Eastern Pennsylvania Railways, Pottsville, Pa., and subsidiary companies realized a balance for the year 1921 of $393,065, which was transferred to surplus account, making the total accumulated surplus on Dec. 31, 1921, $1,020,895. According to the annual report of President Pardee this surplus was greater than for any previous year. The operating revenue increased from $1,932,751 in 1920 to $2,290,526 in 1921. The expenses, including taxes and rentals, increased $113,755.

Net Income of $980,838.—The income statement of the Brooklyn (N. Y.) City Railroad for the eight months ended Feb. 28, 1922, and 1921, was made public recently by H. Hobart Porter, vice-president. The eight months ended Feb. 28, 1921, include the strike period. For the eight months ended February, 1922, the company realized revenue from passengers amounting to $7,412,175, against $6,345,330 for the same period a year ago. The net corporate income for this period amounted to $980,838, against a deficit for the eight months ended February, 1921, of $908,994.

$50,000 More Approved.—An additional $50,000 for the city's expenses in the valuation proceedings of the Philadelphia (Pa.) Rapid Transit Company before the Public Service Commission was recently approved by the finance committee of the City Council. An appropriation of $175,000 has already been approved for the employment of experts. The work of fixing a value on the Philadelphia Rapid Transit properties is for the purpose of determining the permanent rate of fare the company should charge. Chairmen Gaffney recently explained how the appropriations had so far been spent.

New United Light Issue Offered.—A new issue of $7,000,000 United Light & Railways Company, Grand Rapids, Mich., first lien and consolidated mortgage 6 per cent gold bonds, Series A, is being offered by Bonbright & Company, Inc., New York, N. Y. The bonds are dated April 1, 1922, and are due April 1, 1952, and are non-callable for twenty-five years. They are offered at 93¾ and accrued interest, to yield more than 6.45 per cent. The company operates properties furnishing diversified public utility service in seventy-seven communities in the Middle West, most of them in Iowa and Illinois.

Service Will Be Resumed.—Railway service will be resumed in Corpus Christi, Tex., by the Nueces Railway. Street car service in Corpus Christi has been suspended since the power plant was destroyed by fire in October, 1921. A new power plant has been built, and the three-phase equipment was cut in last week. During the time the cars were not in operation, transportation was afforded by motor buses operated by the trainmen of the traction company. When the new service is inaugurated a 5-cent fare will be charged, and a twelve-minute schedule will be maintained on the company's lines.

Traffic and Transportation

New Fare Expected

Commission Takes Under Consideration Chicago's Preferential 5-Cent Rate —Adjournment Until April 26

An order for a new rate of fare on the Chicago Surface Lines is expected in the near future. The 8-cent fare still continues under federal court injunction, and the Illinois Commerce Commission took under advisement on March 31 the city's application for an experimental rate, preferably 5 cents. The last hearing before the commission was marked by a formal notice from the employees' union that a cut in wages would mean a strike. The Chicago company is now paying a maximum wage of 80 cents an hour for platform men and the union representatives resented the suggestion of the commission and the city that they should do something to help reduce the cost of transportation.

The union statement was presented in written form at the conclusion of evidence. The men asserted that the cost of living in Chicago has not fallen so as to justify a reduction in wages, which, they claim, are for the first time on a basis parallel with living costs. They presented figures to show that rents, fuel and taxes are higher than the government data indicate. In speaking on behalf of 14,000 employees and their families they protested against "that which seems to them an attempt to force these workers and their families back into the condition of want and privation they experienced so many years." They also made a strong defense of present working conditions provided by their agreement with the company, claiming that the city's contentions for a longer work day and more swing runs would be a hardship and would reduce the number of runs so as to deprive thousands of employees of their jobs. They refused to bear the burden of any economies which the companies might be ordered to make.

After the city's attorney had talked for several hours in the closing arguments, the company's lawyer said he would rest his case on the showing made in the federal court that evidence had not been presented to justify a reduction of the 8-cent fare. Counsel for the city stated that he was not asking the commission to fix wages or salaries, but said it could order a rate of fare which would force the company to economize. He suggested that further payments into the renewal and damage funds be prohibited and that the commission might even consider the city's 55 per cent of net receipts as profits because the city will not accept this money.

Chairman Smith of the commission made a statement in which he denied any prejudice or political bias on the part of that body and regretted that the law did not empower him to demand an explanation of those who have circulated such charges. It has been rumored that the commissioners were agreed on an order for a 6-cent fare and 1-cent transfer charge, to be made effective before primary day, April 11. An adjournment was taken until April 26, when evidence will be resumed in the main case, this proceeding having been based on a demand for a temporary trial of a lower fare.

Petition for Ten-Cent Fare

A committee of business men recently conferred with officials of the Wheeling (W. Va.) Traction Company and urged that a straight 10-cent fare be established from Wheeling to Bridgeport, Martins Ferry and Bellaire, all Ohio towns, and that other fares be cut to not more than 60 per cent above those of 1914. H. C. Ogden, spokesman for the business men, said the company's franchises provide for a 5-cent fare, including transfers, and that these still constitute a contract, although every one agreed that during the war a higher fare was needed. The burden of proof was now on the company.

W. B. Wills, general manager of the Wheeling Traction Company, said the company was operating at a loss. The average seating capacity of a car, he said, was fifty-seven and the average load only twenty. He said the buses operating between Wheeling and the Ohio cities were taking $10,000 a month from railway revenues. Company officials told the committee they would notify it before July 1 if a fare reduction were practicable.

One-Man Cars Can Be Operated Safely

When the Illinois Commerce Commission authorized the use of one-man cars in Illinois by the Tri-City Railway it referred to the common objection that certain serious accidents have happened in the operation of one-man cars. Yet the commission indicates that there is nothing in the record to show that these particular accidents are due solely to the use of one-man cars.

According to the commission, statistics in the record showed that fewer accidents have happened by the operation of one-man cars than as a result of cars operated by two men, step accidents especially being reduced to a minimum due to one man being in full charge of the car in starting and stopping, obviously eliminating the divided responsibility under the two-men operation. In its statement the commission said that the safe operation of this type of car requires the motorman never to reverse or back them and further that the car should never be operated except from the controller in the end facing the direction toward which it is moving.

Hollywood Rehearing Held

Commission's Engineer Declares Impossible the Plan of Operating Hollywood Line Separately

The rehearing granted by the California Railroad Commission to communities who protested the recent rate increases on the lines of the Pacific Electric Railway was held on March 20, 21, 22 and 23. The commission's decision of Dec. 24, 1921, granted the Pacific Electric an increase on a mileage basis in interurban fares, which were put into effect on Jan. 1, 1922, and an increase of local passenger fares on its nine local lines in Los Angeles, whereby the commission established a zone system for a 6-cent fare for traveling in each of the two zones, inner and outer and a 10-cent fare for traveling from one zone to another with transfer privileges. Details of the fare order were given in the ELECTRIC RAILWAY JOURNAL, issues of Jan. 7 and Jan. 14.

The strongest protest came from the Hollywood Board of Trade, and following the protestants' request the hearing was held in the Masonic Auditorium in Hollywood. It developed at the first day of the rehearing that due to amended petitions filed by the Hollywood contestants, the main issue involved the subject of the extensions to Hollywood of the lines of the Los Angeles Railway rather than the anticipated protest. The Los Angeles Railway angle of the case was disposed of when the commission ordered interested parties to the controversy to submit briefs of arguments within a period of twenty-five days. Ten days additional in which to answer the briefs were also provided for in the governing body's stipulation.

COMMISSION'S JURISDICTION DISCUSSED

At the opening of the rehearing held en banc before the Railroad Commission, President Harley W. Brundige of the commission brought up the point of the jurisdiction of the commission over public utilities and asked for citations upon the point of this overlapping jurisdiction that would make clear whether the power to order extensions of paralleling lines into the territory already occupied by a public utility is vested in the Board of Public Utilities of Los Angeles or in the Railroad Commission.

The Hollywood Board of Trade attorney said that the authority of the commission was paramount in the instance under discussion. The Los Angeles city attorney claimed that the line between the jurisdiction of the city and the commission was not clearly drawn. The opposite side of the argument was taken by E. O. Edgerton, former head of the railroad commission, and at present acting as special counsel for the Los Angeles Railway. Mr. Edgerton stated that the city's present class of twenty-one year franchise makes the financing of such lines an impossibility. The Hollywood Board of Trade is trying to force some authority to extend five different lines of the Los Angeles Railway into Hollywood territory now exclusively served by the Pacific Elec-

Digitized by Google

tric, The Los Angeles Railway still operates a 5-cent fare in Los Angeles.

It was declared by the Los Angeles Railway counsel that the lines demanded extended had only 4, 5, 9 and 19 years yet to run on their existing franchises, and that the class of franchise now obtainable in the City of Los Angeles was not an asset as the old 40 and 50 year type of franchise granted in the early days; but the newer type was a liability. It was opinioned that any order of any governing body to extend these lines would be confiscatory and force the Los Angeles Railway to apply for higher rates on its entire city lines if it was forced to extend its 5-cent lines into Pacific Electric 10-cent Hollywod territory to satisfy Hollywood's clamor for a 5-cent fare regardless of the haul of over 8 miles involved.

Paul J. Ost, Assistant City Engineer of San Francisco Municipal Street Car Lines, and employed by the Hollywood Board of Trade to show that the Railroad Commission's basis on which the Pacific Electric was granted an increase of rates was unsound met with considerable opposition. He claimed under testimony that his calculations were based on data supplied by the commission's engineers in their service survey and valuation report of the Pacific Electric Railway's property; but it appeared that Mr. Ost got hold of some wrong figures in the report, as Mr. Richard Sachse, Chief Engineer of the Commission, stated that the figures used by Mr. Ost were taken from an incomplete report of the state engineers compiled in June, 1921.

Suggests Independent Operation

Mr. Ost attempted to set the Hollywood lines out as a separate entity—to be operated independent of the other nine local city lines of the company. The commission's chief engineer explained that this was impossible. It was also cited that the State Constitution and Public Utilities Act prohibits the commission from discriminating against persons and places. It was shown that the earnings of the Hollywood Lines in January and February of this year installing the higher fares showed an increase of approximately $30,000 over the same months of 1920.

The zone alteration asked for in the amended protest filed with the commission was withdrawn by the Hollywood attorney restoring the zone to original bounds, as Engineer Ost for Hollywood recommended the inner zone be expanded.

Mr. Sachse of the Commission is defending his reports and recommendations to the commission, as attacked by Mr. Ost, claimed Mr. Ost's methods of rate-making theory were wrong and would not apply in the Hollywood case. Mr. Ost opinioned himself as opposed to a zoning system, being favorable to the straight fare as applies on the San Francisco municipal lines. He stated that the main point in which his report departed from the data furnished him by the commission's engineers was in estimated operating expenses of the Hollywood Lines. The maintenance charged these lines he insisted would bear trimming. His methodical theory of a reasonable rate on the Hollywood Lines was that the present 10-cent fare from the outer zone in Hollywood into the inner zone or vice versa should be 8 cents—a haul of over 8 miles.

During the first two days of the rehearing the Hollywood interests were concluded, and the last two days, as held in the commission's court rooms in Los Angeles, were devoted to rehearing other communities of Southern California served by the Pacific Electric local and interurban lines, who were petitioning the commission for a further readjustment of the rates.

Bus Lines Under Consideration

Attorneys for Alhambra, South Pasadena and Glendale communities leading in the petition for readjustment of the rates had municipal bus lines under consideration, so they informed the commission, but Mr. Sachse gave it as his opinion that very careful investigation should be made before any effort was made to start bus lines to compete with the Pacific Electric. Other suburbs of Los Angeles also filed petitions.

The attorneys from outlying interurban ciites did not offer further protest to the valuation figures of the Commission on which a fair return was estimated, as they had previously protested against the valuation figures including a fair return on donated rights of way and bonuses, claiming their rates should be lower on lines operated over such free rights of way and under such conditions.

These communities' attorneys testified it was a judicial point observed in rate-making throughout the United States and the law governed in this respect. The chief counsel of the Pacific Electric filed a brief with the commission outlining the Company's position and attitude in the matter and citing many and certain Supreme Court rulings in this particular instance.

It will probably be forty days before the commission can conclude a decision in this rehearing.

The Los Angeles Railway Corporation's application for a rehearing for a straight 6-cent fare on its lines without taking the token privilege, as formerly authorized by the commission, was scheduled for rehearing at this time. The Los Angeles Railway had rejected the commission's granting of an increase from 5 to 6-cent fare with token privileges and requested a rehearing for purpose of eliminating the token feature and obtain, if possible, permission for a straight 6-cent fare.

While the Hollywood-Pacific Electric case was under way the Los Angeles Railway requested permission of the commission to withdraw its petition for a rehearing, which was granted and the application wiped off the board. This means that the Los Angeles Railway will still continue operating under the 5-cent fare in Los Angeles.

Committee Claims Exoneration From Charges of Bad Faith

An adjustment committee from the Dallas (Tex.) Railway has filed a statement outlining the position of the railway in the present fare controversy. This committee claims that the railway operated at a loss from Dec. 1, 1920, until May 1, 1921, on which date the City Commission granted authority to increase fares from 5 cents to 6 cents. Further that statements showing the company's loss on file with the Supervisor of Public Utilities exonerates the committee which negotiated with the city as well as the executives and members of the railway's Board of Directors from charges of bad faith made by city officials.

The controversy arose when the city officials learned that $100,000 collected by the traction company since the 6-cent fare went into effect over and above the authorized return of 8 per cent on its invested capital had been paid out to stockholders of the company in dividends. It was claimed that the agreement between the city and the traction company at the time the 6-cent fare was granted, was that additional earnings under the 6-cent fare would be used to make certain improvements, notably paving between the tracks on certain streets ordered paved by the city, and that in not using the earnings as agreed the company had acted in bad faith. The city, when it was learned that revenues under the 6-cent fare had been paid out in dividends, on the ground that back dividends guaranteed by the city were being paid, issued notice of hearing on April 6 on a proposal to reduce fares in Dallas from 6 cents to 5 cents and officials of the company were directed to appear before the commission and show cause why such reduction should not be made immediately.

A detailed statement from the committee outlining the company's position was submitted to the Mayor and Board of City Commissioners. This controversy in Dallas was referred to in the ELECTRIC RAILWAY JOURNAL, issue of March 18.

Increased Fares in Effect

The Public Utilities Commission of the state of Idaho on Feb. 25 handed down its decision in answer to applications of the Boise Valley Traction Company and the Boise Street Car Company for increased fares on city lines. This order authorizes the following schedule for the Boise Street Car Company's city lines and the Tenth and Eighteenth Streets Belt Line of the Boise Valley Traction Company:

Cash fare	7 cents
Ten tickets	50 cents
Forty school tickets	$1.00

The South Boise line operated by the Boise Valley Traction Company was excepted from the order and a cash fare of 5 cents authorized, with forty school tickets for $1. The new fares became effective on March 6.

Meeting Held in Waterbury on Fare Experiment

A proposal that the Connecticut Company be ordered to reduce the fares in Hartford, Conn., to 5 cents, with an additional charge of 2 cents for transfers, was laid before the Public Utilities Commission recently by Alderman Charles Schmidt of Waterbury during a hearing in Waterbury. It was proposed as a part of a suggested experiment for trial in the four largest cities, and after the experimental period the company would be asked to adopt for all the large cities the plan which has proved most successful in the tests. Alderman Schmidt's plan was to have Bridgeport continue with its present radial rate of 5 cents with no transfers, while New Haven would try a straight 7-cent fare, Waterbury a 5-cent fare with transfer privileges, and Hartford the plan mentioned above.

Two of the three members of the Public Utilities Commission who were present at the hearing announced that the commission would give consideration to the plan and announce its decision later.

A citizens' hearing on the matter of a 5-cent fare on the Connecticut Company's lines was largely attended at New Haven, Conn., recently. President Storrs of the company was not present, having been called to Denver by reason of illness of a relative, and the company was represented by Manager Harlan. Mr. Elwell presided for the Public Utilities Commission, as Chairman Higgins is ill. The petition was twofold—a nickel fare and a re-routing of local lines to give positive rather than indirect service on all lines. There were many speakers in behalf of the fare, some asking for the 5-cent unit and showing a willingness to have a transfer made an extra charge, while others wanted action which would end the plan of having transfer points at busy places on the central streets.

Jitney Regulatory Ordinance Invalid

The city ordinance passed by the City Commission of San Antonio, Tex., several weeks ago regulating the operation of jitneys inside the city limits, has been held invalid and an injunction restraining the city authorities from enforcing its provisions has been granted by Judge R. B. Minor of San Antonio. The ordinance was passed by the city in carrying out its part of the agreement with the Public Service Company, which owns and operates the electric railway system in that city, under which fares were reduced to 5 cents on condition that the city stop the operation of jitneys within the city except those operating to Camp Travis, which is not served by a car line. Since the ordinance was held invalid and its enforcement enjoined, jitneys have run riot, taking any route desired and maintaining any schedule or no schedule at all.

In his opinion Judge Minor said that if the controlling purpose of the commissioners in passing these ordinances was to destroy the jitney business and create a monopoly in the San Antonio Public Service Company then two conclusions must follow: First, that the ordinances were not passed for the bona fide purpose of relieving congestion in the interest of public safety, and, second, the ordinance would be void as having the deliberate purpose to create a practical monopoly.

Transportation News Notes

Hearings Ended. — Hearings before the Nebraska State Railway Commission on the application of the Omaha & Council Bluffs Street Railway, Omaha, Neb., for a permanent rate of fare have been concluded. The finding will probably not be handed down before July 1.

Better Relations Sought. — *Trolley Wires* is a new publication in the interest of the employees of the South Covington & Cincinnati Street Railway, Covington, Ky. It made its appearance on March 30. The object of the publication is to seek a better understanding among railway officials, patrons and employees.

Will Experiment with Lower Fare.— If the State Public Service Commission gives its consent, the Grays Harbor Railway & Light Company, operating in Aberdeen and Hoquiam, Wash., will experiment with a 5-cent fare in the two cities, with a 10-cent fare for intercity travel or to Cosmopolis. The present fare is 10 cents in both cities, with the same fare for intercity travel.

Reduced Fare on Toledo Beach Line. —A reduction in fares on the Toledo, Ottawa Beach & Northern Railroad, Toledo, Ohio, has been announced to take effect April 1. The round-trip tickets from the Casino to Toledo Beach for adults will be 30 cents. Children over 5 and under 12 years of age will be charged 15 cents. Forty-five commutation books good for thirty days will cost $4.80. The former price was $5.75.

I. C. C. Decision Expected April 15.— The decision of the Interstate Commerce Commission in the matter of a general reduction in rates, it now appears, will not be forthcoming before April 15. At present the case is being studied by the commissioners individually. If they should find themselves in substantial accord, the decision probably could be handed down as early as April 15, but should there be important differences among them, it obviously will extend the time required for the consideration of the case.

One-Man Car Operation Started.— Operation of the new one-man cars on certain of the lines of the Dayton (Ohio) Street Railway was started April 2. At the invitation of W. L. Smith, general manager of the company, a number of city officials and members of the City Commission, together with Mayor Hale and City Manager Eichelberger made a test trip the preceding week and expressed themselves highly satisfied with the operation of the cars. The city officials were accompanied on the trip by W. A. Keyes, president of the road, and general manager Smith.

Rerouting Ordinance Passed.—Ordinances calling for the rerouting of all downtown lines of the Cincinnati Traction Company were passed by the City Council by a vote of twenty-seven to five, despite the fact that several business organizations voiced strenuous objections to the plan. The principal argument against the rerouting plan is that it is based upon an elaborate scheme of one-way streets in the downtown section. W. Jerome Kuertz, Director of Street Railways, proposes to reroute nearly all downtown lines over seven different loops.

Increased Fares Resought.—The Galveston (Tex.) Electric Company has renewed its efforts to get an increased fare in Galveston, and at the meeting of the City Commission recently a petition from the traction company was presented setting forth that the company can not meet operating costs under its present fare. The petition was referred by the commission to the city attorney for investigation as to the propriety of considering the petition while the suit of the city of Galveston against the Galveston Electric Company, enjoining the company from increasing its fares, is pending in Federal Court.

Fifteen Tokens for One Dollar. — The Public Utilities Commission of the District of Columbia has authorized the Washington (D. C.) Railway & Electric Company to sell fifteen tokens for $1. The Capital Traction company has been selling at this rate without express authority from the commission. The established fare is 8 cents cash or six tokens for 40 cents, and to save time in purchases the Capital Traction Company advertised fifteen for a dollar, which will now be followed by the Washington Railway & Electric Company.

Fares Adjusted.—Fares on the lines of the City Light & Traction Company, Sedalia, Mo., have been finally fixed by a recent ruling of the Missouri Public Service Commission. Numerous hearings and some changes in previous orders have resulted in a 10-cent cash fare with a ticket rate of ten tickets for 6 cents each and children's tickets for 3 cents each. The property is valued by the commission at $300,000 and the earnings under the new finding are stated to be about 3 per cent with a 3 per cent allowance for depreciation. In the Feb. 18 issue of the ELECTRIC RAILWAY JOURNAL reference was made to the 8-cent cash fare order of the commission.

New Publications

Government Control and Operation of Industry in Great Britain and United States During the World War

By Charles Whiting Baker. Published by the Carnegie Endowment for International Peace, New York. 138 pages.

The tremendous output of the industries in the United States and Great Britain was one of the striking features of the war. The fate of Great Britain and the world, according to Mr. Baker, never hung on a more slender thread than during the early months of 1914, when the question was undecided whether British labor would sacrifice its dearly purchased power over wages, hours of labor, working conditions and output. But Lloyd George accomplished the feat of persuading labor to make this sacrifice, and had he performed no other service he would have deserved perpetual honor as the savior of his country and the world. The industrial record in this country for the five years was a revelation of the world's surplus production capacity, but such stimulation necessarily has to be followed by a period of depression. Mr. Baker's book covers quite thoroughly the action of the government in this country in the case of the railways, public utilities, shipping, labor, fuel, etc., as well as what was done in Great Britain. On the whole, Mr. Baker's answer to the question "How has government operation worked?" during the war must be considered favorable, and he sees in the future an extension of government control over certain industries, in cases where private ownership breaks down.

Principles of Alternating Currents

By Ralph R. Lawrence, associate professor of electrical engineering, Massachusetts Institute of Technology. Published by McGraw-Hill Book Company, New York, N. Y. 432 + xiv pages, illustrated.

This text-book covers the fundamentals of electric circuits in a way which will prove clear and interesting to readers having a thorough preparation in physics and in mathematics through the calculus and the elements of differential equations. Its place is thus the classroom of the high-grade engineering school, or the reference library of the trained engineer who wishes to "brush up" on theory from time to time.

The Electrification of Railways

By H. S. Trewman. Published by Sir Isaac Pitman & Sons, New York, 1920. Cloth 4 x 7 in., 78 pages.

To date there has been but little published on railway electrification for the benefit of the layman. It is the author's intention in this book, without going into detail, to bring to the reader's notice some of the main questions to which attention must be paid, giving at the same time sufficient technical electrical information to enable these points to be understood. The occasion for the book is the wide discussion that has taken place in England for several years past of the electrification of steam railways. The importance of the subject has steadily increased, especially during recent years, and the author states that there is an urgent need for a more general appreciation of the possibilities of electric traction.

Städtebau ("City Planning")

By Otto Blum, G. Schimpf and W. Schmidt. 478 pages with 482 illustrations, published by Julius Springer, Berlin.

This is one volume of a library of twenty-two engineering books being issued by the publishers under the direction of Robert Otzen. It is divided into three parts, each written by one of the authors mentioned. The first takes up city planning in general, the second transportation in cities and the third paving. It is the second section, comprising 274 pages, or more than half of the book, in which readers of this paper will be most interested.

This chapter is a posthumous work of the author, Prof. Schimpf of Aachen, who died shortly after he had practically completed the manuscript. He had studied American transportation systems in this country and his portion of the book embodies data from all countries. In the first chapter the author takes up the question of traffic distribution, hourly, daily and monthly, in different cities in Europe and America, with load curves and charts, showing lengths of ride in certain cities, with a theoretical division of travel between street cars, rapid transit lines and walkers, based on distance covered. In a second chapter he considers the relations, determined from records, between population, mileage of track, speed and number of passengers; then the subject of ideal and actual layouts for radial and longitudinal cities. The following chapter is devoted to rapid transit station layouts, actual and ideal; another to different types of elevated and subway structures, carhouses and repair shop layouts. The fifth section of the book is given up to equipment and contains designs of different types of rapid transit cars, showing seat arrangement, etc., with a table giving dimensions and weights of cars, total and per seat and per passenger, with other details. In the chapter on operation graphic time tables are given of the Hamburg Städtebahn and Elevated Railway, lengths of station stop on the Berlin Elevated Railway, according to the number of passenger interchanges, and whether the train consists of one, two, four or six cars, etc. There is almost an equally extended treatment of traffic, line layouts, waiting stations, track construction, overhead construction, car equipment, fares, etc., for surface lines. The concluding chapters in this section relate to bus and ferry operation.

Legal Notes

NEW YORK—*Damages from Operation of Elevated Railway.*

Where an owner of premises owns land to the center of the street, subject to the public easement, it is proper for the court to consider this fact in fixing the damage from the maintenance and operation of an elevated railway in the street. [Berry vs. City of N. Y., N. Y. Supp., 631.]

NEW YORK—*Removal of Subway Kiosks at Company's Expense Not Compelled.*

Where a traction company located its subway kiosks on the sidewalks under a certificate issued by the board of rapid transit commissioners with the consent of the city, the company could not be compelled to bear the cost of removing the kiosks when the roadway was subsequently widened. [City of New York vs. Hudson & Manhattan R.R., Northeastern Rep., 152.]

NEW YORK—*Receipts from Advertising Are Receipts from Operation.*

The section of the Transportation Corporation's Law under which certain routes of the Fifth Avenue Coach Company operated provided that such a corporation " . . . shall also pay to the comptroller or other fiscal officer of said city 5 per centum of its gross receipts from the operation of said routes." The question involved, which was decided in the affirmative, was whether the revenue derived from advertisements in the interior of stages constituted part of the "gross receipts from the operation of said routes." [City of New York vs. Fifth Avenue Coach Company, 127 Northeastern Rep., 910.]

NEW YORK—*Passenger, Who Passed Behind Car After Alighting Therefrom and Was Struck by Another Car, Held Contributorily Negligent.*

A passenger, who, after alighting from a car, passed behind it and was struck by a car approaching on other track from opposite direction, though she did not actually step on the other track, was held to be contributorily negligent. [Wall vs. International Railway, 188 New York Supp., 550.]

PENNSYLVANIA—*A Passenger Struck While on the Step by a Passing Car Was Guilty of Contributory Negligence.*

A boy 18 years of age, boarding a crowded street car which he could not enter and standing on a step where he knew that there was only 6 in. clearance between the car and any other car that would pass on the next track, was guilty of contributory negligence. [112 Atlantic Rep., 22.]

Personal Mention

H. S. Day Leaves Kansas City Railways

Henry S. Day, equipment engineer of the Kansas City (Mo.) Railways, has resigned to become vice-president, in charge of production, of Smith & Sons Manufacturing Company, Kansas City, manufacturers of road building machinery. His resignation became effective April 1. R. W. Bailey, superintendent of power, has been made superintendent of power and equipment and assumes the added responsibility of the mechanical department. R. S. Neal, heretofore in charge of the drafting room and engineering work in the mechanical department, has been appointed assistant superintendent of equipment.

Mr. Day took up his work with the Kansas City Railways on July 1, 1919, immediately after his return from France, where he served as a Captain of the 37th Engineers. Prior to the war he was a valuation engineer for Sanderson & Porter and before that was for seven years on the New Haven Railroad in a responsible position in connection with the maintenance of the equipment on the electrical division. His early training was gained with the Westinghouse Electric & Manufacturing Company.

Upon severing connection with the Kansas City Railways, his fellow employees at the shop presented him with a fine Hamilton watch and an alligator traveling bag, and Mrs. Day with a forty-eight piece silver service.

C. W. Preble, superintendent of interurban lines of the Ohio Electric Railway, Springfield, Ohio, has taken a similar position with the Cincinnati & Dayton Traction Company, Dayton.

W. G. Neibert, who for several years has been the auditor for the Monongahela Power & Railway Company, with headquarters at Fairmont, W. Va., has been transferred to Parkersburg and will be the auditor for the Parkersburg-Marietta division of the traction company.

M. J. Collins, for twenty-eight years in the service of the Ohio Electric Railway, at Hamilton, Ohio, has been named superintendent and claim agent for the Hamilton district, succeeding Gordon Lewis, to whom he was formerly assistant. Mr. Lewis has severed his connections with the railway.

George H. Hudson has just been appointed master mechanic of the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga. Mr. Hudson was master mechanic of the Tampa Electric Company from 1910 to 1918. In the latter year he resigned to become superintendent of equipment of the Monongahela Traction Company, Fairmount, W. Va. He resigned from that company because of illness and later joined the forces of the Ohmer Fare Register Company which he held until he took up his new work.

Joins Transit Commission

E. A. Roberts of the Beeler Organization Appointed Chief of Transit Bureau

Chief of the Transit Bureau of the New York Transit Commission! This is the title, with its attendant duties and responsibilities as well as honors, bestowed upon Edward A. Roberts on March 23. Mr. Frank Bennett has been named his assistant.

Mr. Roberts takes up his work with no small previous training and experience. He has been assistant to John A. Beeler, consulting traffic expert, and

E. A. ROBERTS

during his connection with Mr. Beeler has done intensive work in the supervising of electric railway operations. His new work will be of prime importance to the Transit Commission, for the expert advice and suggestions which he qualified to offer will increase the value of the regulatory work of the commission.

For some time at least Mr. Roberts' duties will be to work out plans for the efficient utilization of the transportation facilities already in existence. The commission considers that this is the greatest immediate work until new subways can be completed—a matter of perhaps five years.

Mr. Roberts has a long list of accomplishments already to his credit. Since joining Mr. Beeler's organization in 1917 Mr. Roberts has served with the Massachusetts Public Service Commission in the investigation of operating methods and practices preceding state control of the Boston Elevated Railway, and with the Public Utilities Commission of the District of Columbia. His work there was to increase the capacity of the Washington railway systems under war conditions. He has also made extensive investigations for the Philadelphia Rapid Transit Company and the Public Service Railway of New Jersey.

Among his many duties Mr. Roberts has found time to write several illuminating articles for the ELECTRIC RAILWAY JOURNAL.

After his graduation from Harvard College in 1914 Mr. Roberts spent two years with the General Electric Company at Lynn, Mass., and Erie, Pa., in departments connected with the manufacture of electric railway apparatus. During 1916-17 he was a research member of the faculty of the railway engineering department of the University of Illinois, and for a short time thereafter he was associated with the Boston Elevated Railway in its electrical engineering department.

Elbert G. Allen has recently become connected with the Philadelphia (Pa.) Rapid Transit Company's engineering forces. He was formerly advisory engineer with Stone & Webster. Mr. Allen was graduated from the Massachusetts Institute of Technology. He received the degree of B. S. in mechanical engineering in 1900 and E.E. in 1901. He immediately entered the service of Stone & Webster.

William J. Baldwin, assistant to General Manager Kempster of the New Orleans Railway & Light Company, New Orleans, La., in the capacity of publicity director, has resigned to accept the position of assistant to the president of the Alabama Power Company, Birmingham, Ala. Mr. Baldwin's work at New Orleans has attracted unusual attention both for its originality and its forcefulness.

Walter E. Bryan, superintendent of power of the United Railways, St. Louis, Mo., was recently elected president of the Engineers' Club of St. Louis, and president also of the Joint Council of the Associated Engineering Societies of St. Louis. For some time he has served as chairman of the electrolysis committee of the American Electric Railway Association. Mr. Bryan is a graduate of Washington University, and, with the exception of eight months, has served the United Railways in various technical positions continuously since his graduation.

Edwin Gruhl, vice-president and general manager of the North American Company, New York, N. Y., has been elected president of the North American Edison Company, a newly organized subsidiary of the North American Company. The new company was incorporated on March 25 in Delaware. It will own 72.7 per cent of the outstanding common stock of the Cleveland Electrical Illuminating Company and the entire outstanding common stock of the Union Electric Light & Power Company, St. Louis, Mo. The 200,000 shares of no par value stock of the North American Edison Company will all be owned by the North American Company.

Mr. Gadsden Chairman of Committee Reporting on Trade Associations

Philip H. Gadsden, Philadelphia, former president of the American Electric Railway Association, has been appointed chairman of a committee of the Chamber of Commerce of the United States which meets in Washington on April 5 to report on the manner in which trade associations may render the greatest service to business and the public.

George W. Booz has been appointed supervisor of traffic of the Camden lines of the Public Service Railway, Camden, N. J. Mr. Booz was formerly day station master. Jake Adams now holds this position.

Thomas K. Glenn, president of the Georgia Railway & Electric Company, Atlanta, Ga., has been elected president of the Trust Company of Georgia. He plans to give up his work as president of the Atlantic Steel Company.

J. L. Egolf, general superintendent of the Interurban Railway & Terminal Company, Cincinnati, Ohio, has accepted a position as general manager of the Aurora, Elgin & Chicago Railway, Fox River Division, with headquarters at Chicago, Ill.

John Paul Lucas, editor of the *Southern Public Utilities Magazine,* will direct the state "Live-at-Home" campaign in North Carolina. He was appointed by Governor Morrison. Mr. Lucas' work will be to issue information concerning agricultural conditions in the state and to urge the farmers to raise food stuffs so that they may be economically independent.

E. J. Burns, formerly efficiency expert of the San Diego (Cal.) Electric Railway, who is largely responsible for the zone system of fare collection now in successful use there, has been appointed assistant general manager of the company. The appointment of Mr. Burns to the newly created position was one of the first acts of the company's new general manager, Claus Spreckels.

George E. Snider, who has been chief engineer of the Toledo Edison Company, has been promoted to chief engineer of the Ohio Public Service Company, with headquarters in Cleveland. The new position puts him at the head of the production department of the Henry L. Doherty properties at Elyria, Lorain, Warren, Alliance, Massillon, Orrville and Mansfield. J. F. O'Connor, who has had charge of the Acme plant at Toledo, will succeed Mr. Snider. A. L. Rider will take Mr. O'Connor's place.

F. M. Finlayson, superintendent of power of the Worcester (Mass.) Consolidated Street Railway, has been made superintendent of lines also. He has been with this company since 1906, first as chief engineer of the Fremont Street plant. He had previously served the company from 1902 until 1904 as engineer at this station. Prior to the time he was engineer of power stations for the Newton & Boston Street Railway. During his absence from the Worcester company he was engineer of the power plant of the Pittsburgh, McKeesport & Connellsville Street Railway, Pittsburgh, Pa.

Obituary

Leo Daft

Leo Daft died at Albany, N. Y., on March 29. To many persons engaged in the electric railway industry today Mr. Daft's name is merely a memory, so rapidly is history made, but it was he and his contemporaries, Sprague, Van Depoele, Short, Bentley, Knight and others who, in the pioneer days of electric railroading, laid the foundations on

LEO DAFT

which the industry now rests. To record all the work done by Mr. Daft in the early days would require a volume in itself so firmly was what he did linked with the important developments of the times. These developments Mr. Daft sketched himself in an article over his own name published in the STREET RAILWAY JOURNAL for Oct. 8, 1904, on the occasion of the twentieth anniversary of the founding of the paper. This article, six pages in length, reviewed the work done under Mr. Daft's own supervision for the Daft Electric Company in Pittsburgh, Baltimore, Saratoga, Coney Island and on the Manhattan Elevated Railway in New York in 1882 and shortly thereafter. Mr. Daft's active connection with the electric railway industry ceased about 1895. He then traveled extensively at home and abroad until about 1901, when he settled in Rutherford, N. J., and commenced work on a process whereby rubber is vulcanized onto metal plated with alloy. It was along this and allied lines that Mr. Daft had worked recently except for such interruptions as occurred when he was acting as a consultant or as an expert. Mr. Daft was born in Birmingham, England, on Nov. 13, 1843. He was a charter member of the American Institute of Electrical Engineers, a member of the International Conference of Electricians in 1904, a member of the American Association for the Advancement of Science and a member of the Electro-Chemical Society.

Michael J. Clark, for twenty years with the Associated Bureaus of the Pittsburgh Railways, died in that city on March 17.

George F. Allen, for many years a salesman with the Railway Materials Company, Chicago, and widely known and esteemed among steam and electric railway men of the Middle West, died March 24.

W. T. Pilcher, foreman in the Building Department of the United Railways, St. Louis, Mo., was shot by an unknown assailant on Feb. 6, and died Feb. 11. Mr. Pilcher had been with the company nineteen years.

Fred C. Hinds, long identified with the construction of electric railways, died March 12, at his home in West Newton, Mass. He was born in Calais, Me., sixty-eight years ago. He was one of the builders of the Boston & Worcester Street Railway, and he also was interested in the construction of the Bay State Street Railway and other lines in Massachusetts.

Otis H. Cutler, former president of the American Brake Shoe & Foundry Company, died recently aboard the yacht "Seramia" off the Florida coast. At the time of his death Mr. Cutler was chairman of the board of directors of the company. His connection with the company dates back to 1902 when he became affiliated with it as vice-president and general manager. His term as president extended from 1903 to 1916. Previous to his connection with the American Brake Shoe & Foundry Company, Mr. Cutler was manager of the Ramapo Foundry Company. From 1895 to 1898 he served in the New York State Assembly and during the European war was manager of the insular and foreign division of the American Red Cross.

Henry P. Nawn, president of the Hugh Nawn Construction Company, Boston, Mass., died March 28 at Gilboa, N. Y. He was sixty-four years old. Mr. Nawn was associated with many large construction undertakings in New England. His work in and near Boston included the construction of the East Boston tunnel, the Washington Street tunnel, the Boylston Street subway and station, the Cambridge tunnel and stations, two sections of the Dorchester tunnel and stations, the tunnel stations at the junction of Washington and Summer Streets, the L Street tunnels of the Edison Electric Light Company, the foundations of the Elevated structure at Sullivan Square, and the concrete structure of the Boston Elevated Railway at Forest Hills. He organized the Hugh Nawn Contracting Company in 1905. Mr. Nawn was engaged on a construction job at Gilboa at the time of his death.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

American Gear Manufacturers to Meet in Buffalo

The sixth annual meeting of the American Gear Manufacturers' Association will be held April 20, 21 and 22 at the Lafayette Hotel, Buffalo, N. Y.

This association, through a sectional committee, has been giving close co-operation to the American Engineering Standards Committee, and the report of this and other committees on standardization promises to be of unusual interest.

Special emphasis will be given to business conditions in the gear industry and the outlook for the immediate future.

Among the subjects to be discussed are "Good Hob Practice," by H. E. Harris of the H. E. Harris Engineering Company; "The Use of the Projector Comparator in Testing Gear Teeth," by Ralph E. Flanders of the Jones & Lamson Machine Company; "Proportions of Industrial Gears," by G. E. Katzenmeyer of the R. D. Nuttall Company; "The Grinding of Gear Teeth and Its Future in the Industry," by R. S. Drummond of the Gear Grinding Machine Company; "The Gleason Works System of Bevel Gears," by F. E. McMullen and T. M. Durkan of the Gleason Works, and "Conditions in the Industry," discussed from the standpoint of the industrial member companies under the leadership of George L. Markland, Jr., of the Philadelphia Gear Works and from the automotive standpoint with R. P. Johnson of the Warner Gear Company presiding.

An informal banquet for representatives and guests will be held on Friday evening, April 21, the principal speaker at which will be John C. Bradley of the Pratt & Letchworth Company, Buffalo, N. Y., who will take as his subject "What's Ahead."

New Cars Received in London

The London County Council has begun to receive delivery of 125 new tramcars, which have been on order for a considerable length of time. On Jan. 27 a demonstration trial run was given with one of these cars. In general appearance they are quite similar to the cars now in use, being double truck, double deck, with top deck covered, and having a total seating capacity of seventy-eight passengers. There are some changes in the equipment, however. The new cars have two motors of 60 hp. each, as compared with 42 hp. used with the older cars. These latter when hauling trailers are not able to accelerate as rapidly as is desired. The new cars will be able to accelerate with a trailer at a rate of 1.37 m.p.h. per second, which is the rate of the older cars without trailers. By using the new cars in trailer service as far as possible, the average speed on any route will be increased. When running without a trailer the new cars can accelerate at a rate of 2.06 m.p.h. per second, up to a speed of 12 miles per hour. Another improvement is the use of a combined folding step and side lifeguard under it. When the motorman pulls up the step the guard comes into position. The lighting and ventilation on both decks are improved, the light being more evenly distributed and the ventilation improved to prevent draughts.

Proposed Electrification in Hungary

Present conditions indicate the necessity for electrification of Hungarian railways. Although the Government has not arrived at any decision regarding this matter, it is proposed ultimately to electrify all trunk lines radiating from Budapest—a total of about 870 miles, or 1,245 miles including double tracks. No decision has been reached as to the system of electrification, though a new split-phase system, somewhat similar to that of the Norfolk & Western Elkhorn grade, will be given a trial. An experimental run will be started about the end of April on a short line of about 15 km., equipped with overhead construction. If the test proves satisfactory, a definite decision will be arrived at next year, and general electrification will be pushed as rapidly as financial and manufacturing conditions will permit.

New Car Company to Start Operation

The Missouri Car Company, incorporated in Missouri in September, 1920, for $500,000, has purchased a ten-acre tract with building 567 ft. by 102 ft. in East St. Louis and announces it will begin on June 1 the manufacture of trucks for one-man cars under patents by Theodore A. Brewster. Mr. Brewster was formerly with the St. Louis Car Company and the J. G. Brill Company. He will be vice-president and chief engineer of the new company. Edward S. Stebbins will be president of the company. He has been Western manager for a large Western corporation manufacturing hydraulic equipment and has lived in St. Louis six or seven years.

In describing his patents Mr. Brewster says his "non-rollicking" truck will be in the light-weight safety class, specially designed for cars of the Birney type. A feature is that the lower section of the journal box is removable, thereby making it possible to remove wheels and axles without disturbing the journal boxes. The side frames of the truck are of standard I-beam sections. The truck is designed strictly in accordance with A.E.R.A. principles, making it possible to use axles and wheels out of any A.E.R.A. trucks without change. It will manufacture all types of steel cars for city and suburban service, also large motor bus bodies. The company expects to employ 500 men. It will probably be in the market for steel sheets and structural shapes of various weights and sections, also malleable castings.

Municipal System Planning Two Hundred Car Purchase

Inquiries have been made and specifications are being prepared for 200 Peter Witt type cars for the Detroit Municipal system. Bids for the construction and furnishing of these cars will be asked for soon after the election if a favorable vote is cast on the taking over of the city lines of the Detroit United Railways. The Peter Witt cars will be purchased to replace about 340 single-truck cars now being operated by the Detroit United Railway. The commission plans on improving the service by rerouting certain cars and providing new and clean cars to replace the older cars which are now being used.

Rehearing Sought on Lumber Interests

Rehearing of the open price association practice in trade or modification of the decree in the hardwood lumber to permit of the collection and dissemination of production, sales and stock reports has been requested of the United States Supreme Court in a petition filed by the American Column & Lumber Company, the defendants in the recent suit in which the court decided the practice was illegal because in violation of the anti-trust law. The lumber interests base their request on misinterpretation of certain phases of the case, and make general denial of the conclusions of the court that the purpose of the practice employed by the lumber interests was to curtail production or enhance prices.

Metal, Coal and Material Prices

Metals—New York	April 4, 1922
Copper, electrolytic, cents per lb.	12.675
Copper wire base, cents per lb.	14.062
Lead, cents per lb.	4.90
Zinc, cents per lb.	5.10
Tin, Straits, cents per lb.	29.50
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.575
Somerset mine run, Boston, net tons	1.875
Pittsburgh, mine run, Pittsburgh, net tons	1.85
Franklin, Ill., screenings, Chicago, net tons	2.05
Central, Ill., screenings, Chicago, net tons	1.875
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y. cents per lb.	5.90
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$1.97
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	84.00
White lead, (100-lb. keg), N. Y., cents per lb.	12 25
Turpentine (bbl. lots), N.Y., cents per gal.	68 00

Rolling Stock

Pittsburgh Railways has ordered forty cars from the Standard Steel Car Company.

Binghamton (N. Y.) Street Railway, through William G. Phelps, receiver, recently awarded a contract to the Cincinnati Car Company for seven new double-truck steel cars at a cost of $71,545.

Tampa (Fla.) Electric Company will purchase twenty single truck Birney cars and four double truck cars if the funds for the program of improvements are voted at the meeting of the stockholders in Tampa on May 2.

Brooklyn (N. Y.) Rapid Transit Company will expend $860,000 in converting several cars into the one-man type and for reconstructing tracks of several lines. Mr. Garrison, receiver, said that the present financial condition of the company warranted this expenditure to rehabilitate the company's service.

Track and Roadway

Calgary (Alta.) Municipal Railway has asked the City Council to approve a recommendation for the rehabilitation of the electric railway. It is reported that approximately $24,000 a year for ties and about $40,000 a year for subbase will be required during the next eight years.

United Railways, St. Louis, Mo., following approval by the receivers, is placing orders for material to construct fifty motor cars of the Peter Witt type to be built in its own shops. The new cars will be of the same general construction as fifty-one motor cars built last year. The approximate cost is $500,000. A total seating capacity of sixty passengers will be provided and the approximate weight will be 35,000 lb.

Tacoma Railway & Power Company, Tacoma, Wash., will share in the repairing of Broadway, from Seventh to Seventeenth Streets, at a total cost of $175,000, by the relaying of tracks and standing a portion of the paving expense. The new rails required will cost $20,910. Laying new ties and foundations, tearing out old tracks and paving approximately one-third of the width of the street will cost between $60,000 and $70,000, making a total expense of $90,000 to the company.

Seattle, Wash.—To finance the purchase of rails for use on First Avenue, to be installed in connection with new paving there, the city of Seattle, Wash., may resort to giving bonds to the manufacturers in payment for material and to the contractor who performs the work. A bond issue of $680,000, including this project, has long been authorized, but the securities failed to sell recently, although publicly advertised. Corporation Counsel Walter F. Meier has begun preparation of an ordinance directing the Board of Public Works to prepare plans and specifications for the improvement.

Columbus Railway, Power & Light Company, Columbus, Ohio, has several important improvements in prospect which were recently approved by the stockholders. These include paving of the company's share of Front, Third and East Main Streets, installing a double track on Third Street, extending the tracks used by Leonard, Linden, Mount Vernon and Shepard cars directly east on Spring Street to Cleveland Avenue instead of turning at Chestnut, Naghten and Fourth Streets.

Cincinnati, Ohio.—Plans and specifications for Section No. 6, the longest stretch of the rapid transit loop for Cincinnati, have been completed by the Rapid Transit Commission. The unit is to be built in the open and will extend a distance of approximately 3 miles. The estimated cost is $399,635. Bids on the construction will be advertised at once. Frank Krug, chief engineer, reported at the meeting of the commission that of the $6,000,000 bond issue voted for the rapid transit loop bonds to the amount of $3,300,000 had been issued and sold and that the commission had remaining $2,700,000 to be sold.

Indiana Service Corporation, Fort Wayne, Ind., track extensions to the site of the International Harvester Company plant east of the city will be delayed until actual work is started on the new plant, according to S. W. Greenland, general manager of the railway. Plans have practically been completed for the work, Mr. Greenland said, but the two lines called for in the contract between the traction company and the Harvester company will not be started until more definite information is available. The corporation, said Mr. Greenland, is now devoting its efforts to the erection of a high-tension line from the Decatur interurban road to the Fort Wayne, Van Wert & Lima electric system, to provide feeders for the Harvester company plant for power and lighting.

Power Houses, Shops and Buildings

Toledo & Indiana Traction Company, Toledo, Ohio, is planning a new interurban freight station at Washington and Ontario Street.

Hagerstown, Md. — The Western Maryland Railway and the Hagerstown & Frederick Railway have entered into a contract by which the former will dismantle its electric power generating plant in the shops at Hagerstown and thereafter purchase power from the Hagerstown & Frederick Railway.

New Orleans Railway & Light Company, New Orleans, La., is revising plans perfected thirteen years ago for the erection of an office building. The company's headquarters were recently destroyed by fire. If found suitable with changes adaptable to present construction methods an up-to-date building will be erected upon the old site at Common and Baronne Streets. Meanwhile the company's headquarters temporarily will be at 421 Baronne Street.

Rutland Railway, Light & Power Company, Rutland, Vt., has removed its motor-generator set from the Rutland substation and installed it at Castleton Corners. This will supply the railway with 60-cycle current at this point and is the last change necessary to transfer the railway load from 25 to 60 cycle. A new 60-cycle generator for the Cavers Falls generating station, which is replacing a 25-cycle machine, is now being installed.

Seattle, Wash., city officials are considering steps to reduce the amount of power purchased from the Puget Sound Power & Light Company to operate the Seattle Municipal Railway. The City Council utilities committee has ordered a favorable report on a resolution by Councilman Philip Tindall, calling on J. D. Ross, Superintendent of City Lighting Department, for a statement as to the earliest date at which the light plant will be ready to take over 5,000 kw. of the railway power load. Under the contract of purchase for the traction property, the city has a right at any time after March 1, 1922, to take over 5,000 kw. from the load now being furnished by the Puget Sound Company by giving one year's notice.

Trade Notes

The Uehling Instrument Company, manufacturers of CO_2 recorders and other fuel economy equipment, announces that the principal office of the company is now located at its factory in Paterson, N. J., instead of at the former address, 71 Broadway, New York City.

Combustion Engineering Corporation, New York, N. Y., announces the opening of a new branch office at 1137 Guardian Building, Cleveland, Ohio. This office will be in charge of Frank Henderson, who has been associated with several of the most prominent stoker companies in this territory for many years.

Largest Order for Power-Saving Devices.—A note in this department in the issue of March 25 regarding the recent Philadelphia order for Economy watt-hour meters referred to it as "probably" the largest order for power-saving devices ever placed. The comparison intended was in amount of money involved. The Brooklyn order in 1920 for 2,400 Arthur recorders is claimed still to hold the record for number of devices sold on a single order.

Chester F. Gailor has resigned as consulting engineer of the Trackless Transportation Company, New York City, to devote his attention to other business with which he has been closely associated. He was in 1913 made assistant chief engineer of the United Railways & Electric Company, Baltimore, and before that was with the Hartford division of the Connecticut Company.

Obstacles to Success in the Membership Campaign

THE campaign for new railway and manufacturing members for the American Electric Railway Association is now in full swing. The active co-operation of the whole present membership is being enlisted. While the "prospect list" is not a long one, as measured by mileage or business done, yet all companies listed ought to be in the association for their own benefit and for the good that they can do the industry.

The fact that there are any names on the prospect list shows that real or fancied reasons for non-membership exist in the minds of the prospects. These the present members must meet. The most formidable is that "the benefits of association membership, while undoubtedly great to others, are not available in our case." The attitude thus expressed simply indicates that the scope of operation and the effectiveness of the association machinery are not clearly understood. Another obstacle is a supposed lack of funds, which simply means that available funds are assumed to be needed more for other purposes than this. Again, there is lack of appreciation of what association membership is worth. There is a danger that indifference to the real best interests of the local railway or manufacturing property may lie at the root of the whole difficulty.

In exhibit years there was an extra and compelling reason for manufacturers and railways being in the association. They would otherwise miss a great opportunity. The lack of an exhibit last year thus undoubtedly affected the membership somewhat. This obstacle to enlistment in association ranks has been removed by the decision of the association at Indianapolis that the exhibit feature of the convention will be restored this year.

What's Meant by Publicity Anyhow?

IT'S a safe wager that if you asked an electric railway man what publicity means, he would answer: "Publicity is telling the public why we are entitled to such and such a fare or why we shouldn't pay taxes or why we have the right to the public highways, etc." In short, he might say: "It's the art of telling the public about our rights and our wrongs."

But suppose you asked a merchant to define publicity. What would he say? Wouldn't he be likely to reply something like this: "Publicity is the art of telling the public that your goods are not only desirable but good value for the money." Can you conceive a merchant using space to point out that the pushcart peddler pays no rent and only a nominal license fee? Just how much difference is there between that and the usual anti-jitney campaign which does not realize the import of that truly American slogan: "Every knock is a boost"?

In a recent case, a company which has used many columns of newspaper space to chide the public for permitting jitneys was ordered to furnish certain short ride service at a lower fare. One would have expected that a car card or dasher sign at least would have been used to set forth the merits of the reduction as a reason for increased patronage. Nothing of the kind has been done. The tragedy is that the management in all honesty believes it did all that was necessary by merely refraining from cutting service under the lower fare. The idea that a car ride cannot be sold as readily as "Sunstruck Prunes" betrays what the modern psychologist would call an "inferiority complex." Is it that the electric railway manager feels that no one ever takes a trolley ride unless compelled by bitter necessity? If he feels that way about it, why doesn't he enter another field and leave the job to those who know that the electric car, nine times out of ten, offers the biggest value for the money—and the greatest usefulness, too—to practically every element of the community.

Lakeside Power Plant a Big Undertaking

WHATEVER the final outcome as to the over-all operating efficiency and economy of the new Lakeside generating station of the Milwaukee Electric Railway & Light Company, one must admire the courage displayed in daring to pioneer on so big an undertaking as a 200,000-kw. station completely built around the idea of burning coal in pulverized form. For if this plant proves to be capable of producing a kilowatt-hour on fewer heat units than is being done in our modern stoker plants, then a development of far-reaching importance has been made available to the whole electrical industry. But with the prospect of taking on all the difficulties that go with an initial departure from standard practices, it was of no small moment when the decision was made to risk an enormous investment, and perhaps reputations, on a radically new fuel combustion system as applied to central station work, with but a small trial installation and tests as the basis of the decision.

The station was constructed during the year 1920 under conditions particularly adverse to the realization of a low construction cost. Labor cost was at its highest level. The severe cold and the location of the plant away from the city and transportation made it necessary to build and operate three construction camps for 200 men each in order to keep the men on the job even at the high wages. Much of the mechanical equipment had to be designed originally for this plant, involving a high development cost on top of the generally high equipment costs prevailing during 1920. The whole construction work was necessarily carried on under great pressure on account of the immediate need for additional generating capacity. There was the necessity to excavate a 70-ft. embankment at the lake side in order to put the condensers down where there would be no waste in lifting the large quantity of condensing water. And in order to provide the suitable intake reservoir for the condensing water it was necessary to spend $400,000 in dredging work and building a rubble mound.

Digitized by Google

Despite these unfavorable conditions, an allocation of the present investment over the ultimate capacity of 200,000 kw. shows a construction cost per kilowatt capacity of $106.51. Elimination of the large item for the rubble mound and unusual amount of other marine, tunneling and excavation work, in order to put Lakeside on a more nearly comparable basis with the construction work on other recently built large generating stations, would seem to bring the cost of Lakeside into a favorable position.

There has not been sufficient time as yet to complete the research work involved in this development, nor have all of the opportunities been exhausted for research opened up in connection with the development of numerous original ideas which are incorporated in the design of this plant. However, the long series of tests made under the auspices of the United States Bureau of Mines have provided the basis for strongly expressed confidence on the part of the designers of the plant that their original expectations as to operating efficiency will be fully met. It is expected that full operating figures of the new station will later be made available. The true extent to which powdered fuel burning may affect future central station design will then be determinable.

Apply Modern Parts to Old Equipment Where Possible

THE task of furnishing more reliable service and of extending the life of railway operating equipment is an ever-present one with the superintendent of equipment and the master mechanic. Thoroughgoing maintenance includes both of these. Reliable service results from keeping all parts in a condition that will obviate trouble. Greater life from the various parts can come only with the use of better materials in construction and better methods in care and assembly and the selection of more satisfactory designs. But in the problems of maintenance the application to old equipment of improvements incorporated in late designs of equipment has not received the attention that it merits.

In an article in this issue John S. Dean discusses some improvements which form a part of most recent motor designs and which can be incorporated in old-type railway motors with beneficial results. For example, a number of modern designs of brush-holders are available for some of the old-type motors and, in cases when the complete brush-holder cannot be used, repairs can be made frequently with such improved parts as springs, ratchets, contact tips and braided shunts.

These changes from old designs have come about through the efforts of the manufacturers to improve their products and through results obtained in exacting service. Their adoption and application to present equipment will result in longer life and better service. Some improvements, like the use of spring pads under field coils to keep them tight, of brass or copper sleeves on brush-holder and field leads and of fiber or wooden cleats for wiring around the frame, are very simple and can be readily adopted without great expense.

With new equipment maintenance costs are comparatively low. But when repairs are necessary, methods and materials found most satisfactory by the manufacturer should be used. The use of correctly shaped armature coils, of pure tin solder instead of ordinary half-and-half solder and of a high grade of tinned-steel banding wire will do much toward producing high-class repairs. Proper maintenance means something more than restoring parts to their original new condition. It should include the use of the most modern parts and up-to-date methods.

Concentrate on Incentives for Best Results in Organization

WHY does a man who is in business for himself work, in general, with more satisfaction and interest to himself than one who works for others? In spite of his longer hours and greater financial risk, he is happier in his work provided that he has the requisite talent for business. The reason for this is obviously that he benefits directly by the results of his efforts and he is able, within limitations imposed by his financial and personal capacity, to carry out his ideas promptly. From this point of view it would seem as if everybody would want to get into business, but it is perhaps fortunate for the industrial condition of the country that only a small part of the population of the country have sufficient business capacity to enable them to be their own employers. Most of them must work for others, but if they are to do their best work they must be furnished an environment as nearly as possible like that which would surround them in their own business.

Recognizing the fact that the ideal condition for work is that under which the employee receives some tangible recognition for good service, electric railway managers are showing an increasing interest in bonus or premium plans of various kinds. Even where actual bonuses are not offered as rewards for good work, the fundamental principle underlying them is recognized. The problem of the executive is to furnish the most potent incentives to good work. What these incentives will be in each case is an individual problem to determine, but the manager must find them if he is to succeed largely. Probably the most extensive system in use is that employed in various departments of the Milwaukee Electric Railway & Light Company. It was inaugurated on a small scale in 1912 and since has been extended. The United Railways of St. Louis adopted a somewhat similar system in 1917. The plan of paying bonuses for fuel saving has been extensively used in power plants, as by the Manila Electric Railway & Light Company, and for accident reduction on a number of properties. Thus, last Christmas, the Los Angeles Railway distributed about $90,000 in awards to transportation employees, graduated on the basis of performance in this respect. Many received $60, and some as much as $120 for the year.

Money bonuses are not the only way of providing an incentive. The same result has been secured as in Philadelphia by making the men feel that they will participate in the prosperity of the company. A regular profit-sharing system is followed on the Pittsburgh, Butler & Harmony Consolidated Railway & Power Company under the McCahill plan and is included in the new franchises under which the combined urban railways of Paris (France) are now operating.

The general application of the piecework system, of which the bonus system is a kind of offshoot, is more difficult in the transportation departments of electric railway properties than in the shops or in manufacturing or mercantile operations. The difficulty should, however, be a challenge to effort rather than a discouragement. Employees are quick to recognize an interest in their welfare on the part of executives. If this interest takes a practical, but non-patronizing form, the reaction will be prompt and profitable.

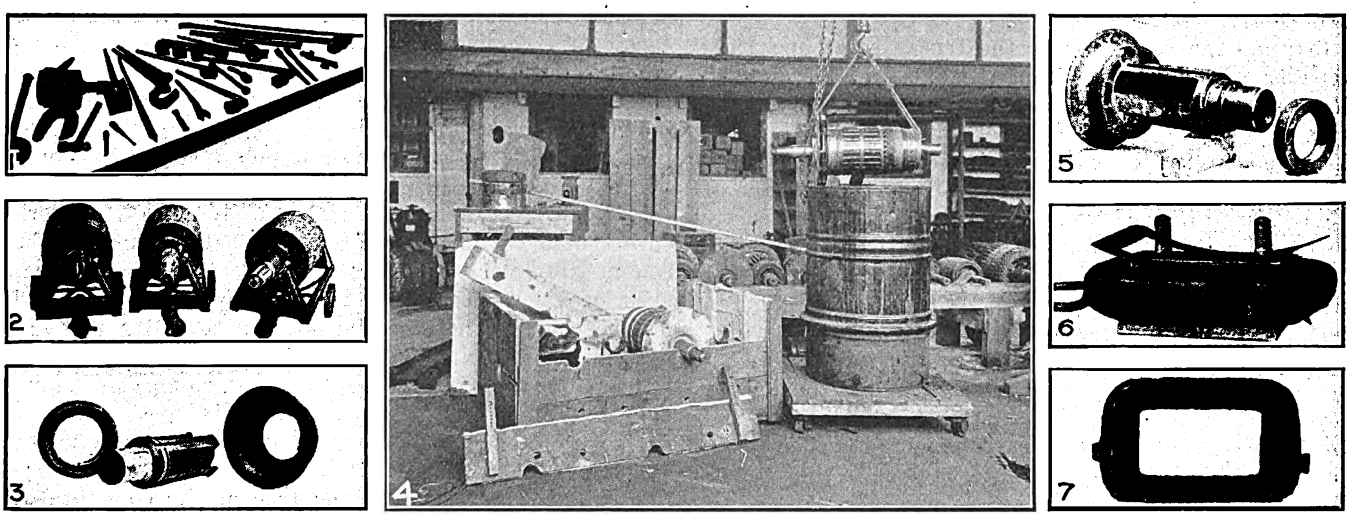
Revamping Old Railway Motors

Many Improvements Which Form a Part of Recent Motors Can Be Incorporated in the Old Types to Reduce Trouble and Decrease Maintenance Costs—Manufacturers' Methods Can Be Used to Advantage When Making Repairs

BY JOHN S. DEAN
Railway Motor Engineering Department,
Westinghouse Electric & Manufacturing Company

SOME of the older types of non-interpole railway motors have made a commendable record for themselves and have many staunch friends among the operating men in various parts of the country. In some instances, this loyalty is so pronounced that it would require considerable effort to persuade these operators to replace their older motors by the more modern types, even though figures were produced to show a considerable saving in power and maintenance charges. On the other hand, there are a number of operators who, al-



HANDY TOOLS AND IMPROVED DETAIL PARTS REDUCE MAINTENANCE COSTS

No. 1—Handy tools for overhauling.
No. 2—Railway motor armature shaft repaired by electric arc welding.
No. 3—Armature spider with detachable rear-end bell—ring key to lock laminations.
No. 4—Dipping and baking outfit made from discarded material.
No. 5—Armature spider and rear-end bell attached in one piece—ring nut to lock laminations.
No. 6—Main field coil with leads coming from the body of the coil and flat steel spring washer for keeping coils tight.
No. 7—Main field coil with terminals at ends for connecting leads.

though great admirers of these older motors, would no doubt replace them with the more modern motors and by so doing increase the earnings of their company, but the necessary money to make this change-over is not available. Both of these classes and many others now using these older motors are interested in the possibilities of bettering the operation and extending the life of the detail parts of older motors by adopting some of the following ideas which may be applied when these motors are being repaired or overhauled. Some of the important considerations to be followed are:

1. It is essential to provide the necessary and most efficient tools and equipment in order to overhaul and repair these motors in good, workmanlike manner and without danger of possible damage to any of the detail parts.

2. It is desirable to have several spare complete motors and armatures available so that when overhauling motors this work will not have to be rushed through the shops. This will encourage careful, consistent work on the part of the men and will result in a more dependable rebuilt motor.

3. In replacing worn parts, a better grade of material should be substituted wherever possible to insure a longer life of these parts.

4. It is necessary to adopt all the improved methods of reconstruction, including up-to-date processes and treatments, and to use greater care in the assembly of the various parts of these motors.

5. All improvements in design of the detail parts which are available should be applied and adapted to older motors.

Some of the more important points that should be considered in connection with the revamping of these old motors will be given in detail for the benefit of operators and master mechanics who may be interested in making their motors more reliable and better able to meet present-day operating conditions.

GOOD WORKMANSHIP REQUIRES PROPER TOOLS

An extremely important factor in doing any kind of work is that it be done by efficient and reliable mechanics who are provided with the necessary suitable tools and equipment. There is nothing so discouraging to any kind of a workman as to be forced to do a job without the aid of the necessary tools adapted for the work in hand. Of course, the job will be done, but generally in a heartless, shiftless sort of way and when completed it may or may not hold together in service. A good selection of small tools, snug-fitting, open-socket and special-type wrenches, flat and pointed steel bars, pullers, jacks, hoists, etc., placed in the hands of the average workman will do much toward producing very good results in the maintenance and upkeep of railway equipment.

In making repairs or when overhauling motors there

Digitized by Google

are times when this work must be rushed through the shop so as to get the required number of cars out on the road to handle the rush-hour crowds. Granted that special rush jobs are sometimes forced upon the shop and cannot be avoided, there are instances where this method of making repairs becomes a habit with operators and all work is handled in this manner, resulting in establishing a standard of poor workmanship, which tends to increase the ultimate maintenance expense. A motor repaired under these conditions is only a makeshift job in many cases, and is very likely to be back in the shop again in a short time for other troubles that should have been detected when in for repairs the first time. It is needless to say that this oversight or apparent neglect on the part of the workmen is largely due to lack of time. This condition can be almost entirely remedied and, further, cars can be put back in service quicker by having extra motors to replace those taken from the cars for repairs or for overhauling. In the case of the split type of motors a number of extra armatures also greatly facilitates repairs and replacements.

In removing motors from the trucks some operators consider it advisable to keep the axle caps so marked that they go back on the same motor from which they were originally taken. Further, the axle bearings, if they are still in good running condition, are wired onto the axle in their original location. It is the practice of other operators wherever possible to have the partly worn pinion put back on the new or repaired motor on the same axle so that the original gear and pinion again work together. These precautions have been found to work out to advantage, as better fits are obtained which tend to reduce friction and noise of the car. After being removed for repairs the motor should be thoroughly blown with compressed air, and the surface scraped and cleaned of all dirt and grease. The motor is then taken apart and the work of overhauling is done in the various shop departments.

Heat-Treated Shafts Prevent Trouble

Worn and damaged shafts are usually repaired by means of the arc-welding process and if carefully done by experienced workmen this has been found to be quite successful, although it is well known that the structure of the steel is more or less weakened by this process. On properties that have considerable shaft trouble this condition can be greatly helped by the adoption of heat-treated shafts that are very much tougher and have approximately 60 per cent higher elastic limit than the ordinary axle steel shafts. These shafts have a tendency to wear less at the journals and will stand much more severe abuse under heavy loads, and are less likely to break. When using heat-treated shafts it is not advisable to do any electric or gas welding on them unless they are re-heat-treated after being welded.

Some of these older motors tend to develop loose iron on the spiders of the armatures, which some operators believe is largely responsible for broken armature leads. In a great many cases it will be found that these spiders are used in connection with a detachable rear-end bell generally made of cast iron with the laminated core iron held under pressure on the spider by a ring key locking device. Experience has shown that these end bells work loose, and in some cases the ring key springs out of place, thus allowing the laminations to move on the spider. An improved construction of spider that will overcome this trouble has the spider and rear-end bell cast in one piece made of malleable iron or steel, and with a ring nut at the commutator end threaded on the spider to hold the laminations under pressure. When this design is used in connection with old laminations it is advisable to have the spider furnished machined at the fit of the iron, from 0.010 to 0.012 in. over size, so that the old iron will be a tight driving fit on the spider. There may be some objections to the spider and end bell cast in one piece as it requires a more expensive renewal charge when the end bell is broken and needs replacement. But experience has shown that with this new type of construction made of malleable iron the end bell is not so readily broken and consequently requires less frequent renewals. The benefit derived from this more rigid construction more than offsets the anticipated objection.

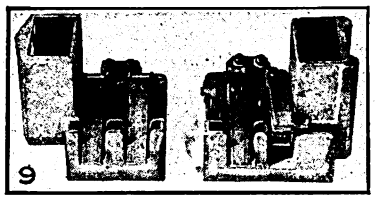
Use Good Grade Mica

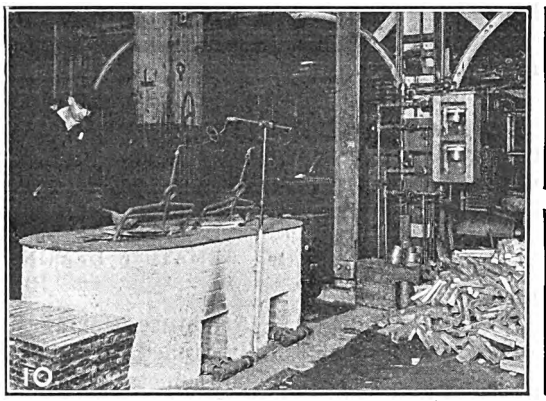
If the commutator is worn down and needs refilling with a complete set of new segments, care should be taken in the assembly to use a good grade of properly treated and built-up mica cones or V-rings, and to tighten the commutator while not under pressure to secure a good solid job. It is advisable to consider the use of malleable iron or steel V-rings and spider if these parts have given trouble in service due to cracking or breaking. If the commutator is not worn out and only needs truing up, this should be done in a lathe after the armature is wound and soldered. In doing this work care should be taken not to cut down the width of the commutator neck, as this would reduce the contact area of the leads soldered into the commutator and might result in their heating up and becoming loose in service. After turning and truing up the commutator some operators grind its face, using a fine abrasive stone held in the tool post of the lathe. This gives a smooth surface and tends to increase the life of the commutator and the carbon brushes. It is considered good practice to round off the edges on the face of the commutator as this helps to keep down flashing. The mica should be under-cut about $\frac{3}{64}$ in. and all particles or slivers of mica in the under-cut grooves removed. The insulation over the front V-ring should be thoroughly coated with a good grade of insulating varnish.

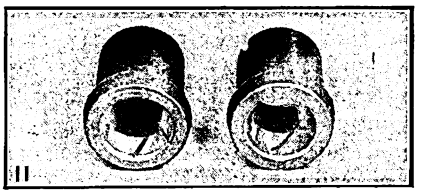
In rewinding, correctly shaped coils should always be used, thus permitting the winding operation to be made with the least abuse to the coils to get them down in place. There is a tendency to use a cheap make of coils which are poorly formed and lacking the required insulation at their weak points. When being wound these coils require more or less pounding and abuse and result in a finished armature that will soon break down in service. This is poor economy, as coils of a higher first cost which are properly formed and insulated will make a much easier winding job and will give a better armature that will stay out on the road. In connecting the windings, information as to the throw of the coils and the leads should be checked carefully with the winding diagrams furnished by the motor manufacturer.

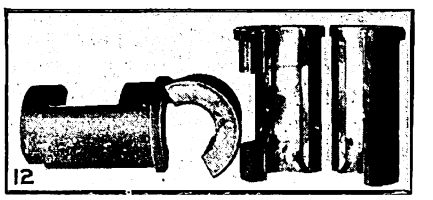
If there is a tendency for the armatures to run hot in service and throw solder from the commutator necks it is advisable to solder these leads with a pure tin solder instead of the ordinary half-and-half solder, as the tin solder will stand higher temperatures and will not soften as readily, thus reducing the possibilities of the leads becoming loose in the neck. An acid flux should not be used in soldering. Alcohol and rosin make a good flux and will not damage the insulation.

Digitized by Google









BRUSH-HOLDER AND ARMATURE BEARING MUST BE KEPT IN GOOD CONDITION

No. 8—Brush-holder spring tension fingers with various detail parts completely assembled—at left, old type; at right, new type.
No. 9—New design brush-holders for old-type motors.
No. 10—Automatic temperature control for babbitting pots.
No. 11—Solid type pinion end armature bearing.
No. 12—Split type pinion end armature bearing.

While soldering the pinion end, the armature should be raised from 6 to 8 in. above the commutator to prevent the solder from running into the windings back of the commutator neck, as this will result in short circuits. Still better results will be obtained by doing the soldering at the side of the commutator instead of on the top.

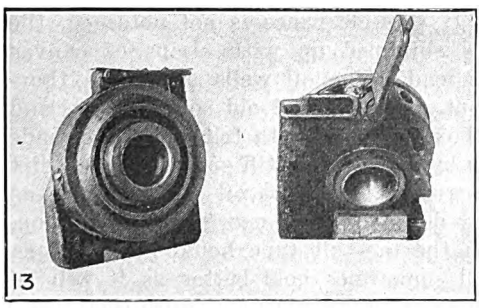
Band Hot to Secure Tight Armatures

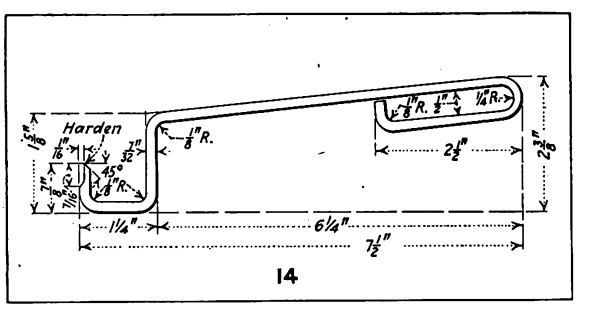
Banding armatures while hot gives a much tighter and more durable banding job, as it allows the coils to be pulled tightly down into the slots. It is preferable to use a high grade of tinned steel banding wire. If these bands are soldered with pure tin solder, instead of the ordinary half-and-half solder, they will hold together better in service, as the tin solder will stand higher temperatures before it will soften and allow the individual band wires to slip and become loose. Narrow strips of tinned sheet steel about 0.012 in. thick placed under the core band entirely encircling the armature, to which the band wires are soldered, strengthen these bands and reduce the tendency for them to become loose.

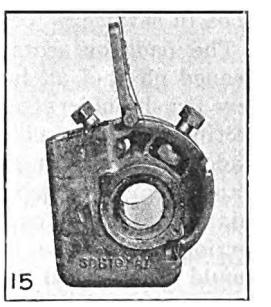
When the armature is completed, either dipping or rolling in a good grade of insulating varnish and baking at a temperature of from 95 to 105 deg. C. will increase its usefulness, as this will: (1) Fill up all the cracks in the insulation on the coils opened up during the winding process, and keep out the dirt and moisture; (2) tend to hold the coils solid in the slots, thus reducing vibration, and (3) form a good insulating coating over the entire surface of the armature, which reduces surface creepage.

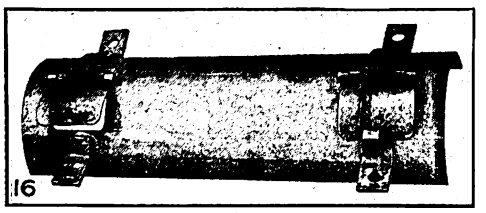
Operators following the above practice report an increase in the life of their armatures, this being especially noted during the winter season when the equipment is subjected to severe moisture, water and snow conditions.

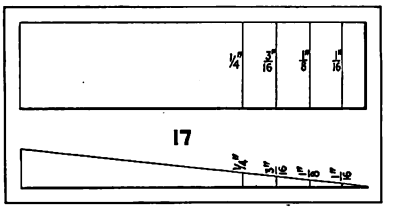
It is considered best practice in connection with all modern motors, and is recommended for old motors, to use cables coming out of the body of the coil instead of the heavy brass terminals to make the wiring around the frame connections. The main objections to the use of terminals is that they are more likely to break off due to vibration, or to develop loose connections which finally burn off the leads. Another disadvantage is the difficulty of properly insulating these terminals after the connections are made. Field coils should be well insulated and then dipped in a good grade of insulating varnish and baked. The dipping and baking should be repeated several times. Impregnating coils in an asphaltum gum further improves the insulation and makes a solid, compact coil that will better resist breakdowns.











VARIOUS TYPES OF HOUSINGS AND DUST SHIELDS FOR RAILWAY MOTORS

No. 13—Tap bolt type housing for split frame motor.
No. 14—Cold-rolled steel brush-holder spring tension adjuster.
No. 15—Through bolt type housing for split frame motor.
No. 16—Sheet steel axle dust shield fitted with inspection holes.
No. 17—Hardwood distance spacer for spacing brush holders from commutator.
No. 18—Malleable iron adjustable axle collars with double adjusting bolts.

Digitized by Google

Porcelains on the brush-holders should be kept clean and tight on the pins to prevent creepage of the current to the ground. If the moving mechanism becomes screechy and stiff, a little signal oil should be added to the moving parts. When repairs are necessary, the improved parts such as steel spiral springs, fifteen-tooth steel ratchet, flat contact tips and the heavier flat braided shunts soldered to the brush-holder castings should be used, as these parts tend to give longer life and better service. Pressures should be adjusted to approximately 5 to 6 lb. per finger. However, if there is a tendency for the motor to flash in service it is advisable to increase this pressure to approximately 8 to 9 lb. per finger. Various modern designs of brush-holders are available for some of the older type motors and their use is recommended. Where these modern-type brush-holders have been used in place of the old original holders, better results have been obtained in connection with the operation of these old motors.

All dirt and grease should be cleaned from parts of the motor frame inside and outside, and the drain holes in the bottom of the frame should be kept open. After thoroughly cleaning, the inside of the frame should be painted with an air-drying insulating varnish. On split motors the surfaces at the split and at the housing or bearing seats should be well cleaned, removing all burrs and high spots by means of a file.

In replacing field coils sufficient spacing washers, preferably of sheet steel, should be used under the coil to insure a tight fit of the coil. In addition to the washers, the use of a flat steel spring washer is recommended to prevent coils from vibrating and chafing which would finally damage the insulation. These washers and springs should be temporarily taped to the field coil to prevent them from working out of place while the coil is being assembled on the pole. The surface of the poles and pole seats should be thoroughly cleaned and all high spots removed by filing before putting together.

Poles may be driven into place by means of a block of wood or a chunk of babbitt, but should not be pounded with a sledge. When pulled up tight these may be tested by hitting lightly with a hammer and noting the sound. Under the heads of all tap bolts and nuts on stud bolts used to hold the poles in place a lock washer should be used to insure that these parts will not work loose in service.

The pads or seats for the brush-holders should be cleaned off and all burrs removed and the repaired or new brush-holders securely clamped in place. In connecting up the field coils reference should always be made to the winding diagrams furnished by the motor manufacturer, which give the correct method of doing this work. After coils are in place and temporary connections are made, the polarity of the various coils should be checked to insure the flow of the current through the coils in the proper direction to produce the required magnetic field strength.

The soldering of all connections to the field coils and wiring around frame leads should be made by or under the direction of some one man experienced in this work to insure a good electrical job. All leads should be cleaned and tinned before soldering. Brass or copper sleeves should be used on the brush-holder leads and on field coil leads when terminals are used on the field coils. If, for any reason, sleeves cannot be used, the wires of the cable should be soldered together. When cables are in place all set screws on the field coil terminals and the brush-holders should be drawn up tight and locked. The field-coil terminals should then be well insulated and shellacked and painted. Leads should be well cleated and protected by wood, fiber or rubber bushings where they pass through the motor frame. The leads coming out of the motor frame should be marked plainly so that the workman will not have any difficulty in making the right connections to the car wiring.

ARMATURE BEARINGS NEED THOROUGH CLEANING BEFORE TINNING

Armature bearings if made of bronze should be carefully tinned and lined with a good grade of tin base babbitt metal. In doing this work the bearing shell should be thoroughly cleaned before tinning. While pouring the babbitt metal its temperature should be kept at from 460 to 482 deg. C. in order to get the best results. After bearings are lined, if the job has been well done the finished bearing will sound with a clear metallic tone when hung up by a wire and tapped with a piece of metal. Malleable-iron bearing shells if tinned before lining with the babbitt will tend to prevent the lining of babbitt from cracking away from the shell, and will give very much longer life in service. On some of the older types of motors, the pinion end bearings were split to facilitate repairs. Where the split type of bearings are used, longer life and better service will be obtained by replacing them with the one-piece solid type of bearing. All bearings should be provided with oil grooves and have the edges at the window chamfered to allow the oil to find its way into the surface of the journal throughout the bearing. If bearings are loose in the bearing seat it may be necessary to use an oversize shell. Some operators have used a shim of thin sheet iron to tighten loose bearings and report fairly good success. Other operators have expanded their bronze bearing shells by forcing a mandrel through them, to make them tight in the housings, and have found this to be quite successful.

CLEAN OIL WELLS CAREFULLY

Housings in split-frame motors should have a good clamping fit between the two halves of the motor frame. After the two halves of the frame are clamped together on the housing the clearance at the split as measured at the commutator and pinion end should be from 0.008 in. to 0.012 in. If this clearance is not obtained, the housings may be shimmed up with strips of canvas treated in white lead. The oil wells should be thoroughly cleaned out, removing all old soggy waste and dirt, and the oil box lids lined with felt should be made to close positively by means of a stiff spring to keep dirt and water from getting into the oil well. Housings should be securely doweled as an emergency precaution. If the threads in the tap-bolt type housings are worn a longer bolt will sometimes hold better as it will be found that the threads at the bottom of the tapped holes have not been damaged. Where the old tap-bolt type of housings are too badly worn to be used, these should be replaced with the new through-bolt type of housings available, for some of the older types of motors. If the housing seats in the frame are badly worn, an oversize housing should be used to secure a good tight clamping fit. This design of housing fitted with through bolts is now being used by a large number of operators and has done much to reduce the maintenance cost of these parts.

After the armature is assembled in the frame it

Digitized by Google

should be carefully checked for the proper air gap and the correct end play. If there is any question as to the air gap being too small, it may be due to the poles not being pulled down tight on their seats. If for any reason the armature end play is excessive this can be remedied by placing thin brass or fiber washers on the shaft between the bearing and wiper rings, or by the use of a steel collar placed over the bearing shell between the bearing collar and the housing. All armatures to give satisfactory operation should have approximately $\frac{1}{8}$ in. initial total end play.

With the armature in place, the brush-holders should be carefully checked and adjusted with respect to the following points:

1. Brush-holder box should line up parallel with the commutator bars.
2. Distance from center line of one brush-holder to the center line of the other brush-holder should be equal to one-fourth the circumference of commutator.
3. Brush-holders should space $\frac{1}{8}$ in. to $\frac{3}{16}$ in., preferably $\frac{1}{8}$ in., from the face of the commutator.
4. Carbons should have a smooth sliding fit in the carbon box of the brush-holder.
5. The carbons should be seated on the surface of the commutator, by means of a strip of sandpaper cut the width of the commutator face.
6. A good grade of unplated graphitized carbon brush is recommended and approved by the motor manufacturer.

Be Sure That Bolts and Nuts Cannot Work Loose

It is very important that lock washers be used under the heads of all tap bolts and under the nuts of all through or stud bolts. Operators are learning the importance of using special heat-treated bolts in connection with the housings, axle caps and frames of railway motors. These bolts have 60 per cent more tensile strength and are tougher and more reliable than the general "run-of-mine" standard hardware bolts, and thus will stand more abuse and are less likely to stretch or break in service.

Bearings should be packed with a good quality of wool waste which has been saturated in an approved grade of car oil for about twenty-four hours. All bearings arranged for side feed and using oil and waste for lubrication depend upon the capillary or wick action of the waste to carry the oil up to the bearing window. Thus, in this type of bearing to insure clean oil reaching the journal, the oil should be poured into the oil well so it must feed up through the waste. If the oil is poured in on top of the waste the tendency is to flood the inside of the motor and to waste the oil. The normal average height of the oil as gaged in the oil well should be $3\frac{1}{2}$ in. maximum and 1 in. minimum for the armature bearings and $2\frac{1}{2}$ in. minimum for the axle bearings.

After field coils are connected up permanently and the armature is assembled in the motor frame, the field coils should be tested for polarity by connecting *F* plus field lead to the trolley through several grid resistors or a headlight resistor and *F* minus field lead to the rails, and with current passing through these coils check the polarity by means of a compass needle. This same testing circuit may be used to give the motor a running test to check the condition of the bearings. Before doing this, it should be made sure that the bearings are packed and oiled and that the carbon brushes are in place. To make this running test, connect *A* plus lead to the trolley circuit, *A* minus lead to *F* plus lead and *F* minus lead to the rails. To reverse the rotation of the armature, connect *A* plus to the trolley *A* minus to *F* minus and *F* plus to the rails. Be sure to open the test circuit after the motor has attained a speed of approximately 800 r.p.m. Test the armature and field windings for ground by means of a lighting-out line connected through a bank of lamps, or by means of an alternating-current testing box. If the motor meets all the above tests satisfactorily it can be passed for service as O.K.

Heat Pinions for Installation

All pinions should be heated in a tank of boiling water for several hours before applying. (Use $\frac{1}{4}$ lb. of washing soda to 5 gal. of water to prevent rusting.) The pinion bore and taper fit on the shaft should be carefully cleaned and all burrs and high spots removed. Keys should have all sharp corners rounded off and should fit properly. The pinion should be driven in place while hot, using a bar of soft metal. On pinions which drive up on the taper too far, some operators report very good results from the use of a paper liner placed between the pinion and the pinion fit.

When mounting the motor on the truck it should be seen that the axle bearings are in good condition, and that the dowels or keys in the axle caps are securely held in place. In addition to the dowels it is essential that the axle caps should securely clamp the axle bearings to prevent movement and rapid wear. To get this clamping action on old bearings worn on the outside, some operators use thin sheets of fiber at the bearing seat, while others have placed metal shims between the two halves of the bearing at the split. Another scheme used to get the desired clamping action is to machine from $\frac{1}{16}$ in. to $\frac{1}{8}$ in. of metal off the axle cap at the split. Special heat-treated bolts fitted with lock washers will hold the axle caps in place more securely. Axle cap oil wells should be thoroughly cleaned out and the oil box covers put in good condition.

If the gear case has a large clearance at the opening for the axle bearing flange it should be provided with two half rings of felt and the grease box cover should be put in good operating condition. If the gear seats on the motor or the suspension pads on the gear case are worn, it is advisable to place sufficient strips of canvas treated in white lead on the gear-case seats to insure that the case will be drawn up tight by the clamping bolts, thus preventing any movement of the two halves.

In order to increase the life of the axle bearings, it is very desirable to provide a reliable dust shield covering the axle between the axle bearings. This shield should be provided with peepholes to facilitate the inspection of the bearing wear. The inspection holes should be protected by a cover which is kept closed by a strong spring so as to keep out the dust and dirt.

In order to take up the end wear of the motor axle bearings, and to keep the motor in its proper position on the axle, thus preventing the gear from cutting through or otherwise damaging the gear case, it is advisable to use a suitable adjustable type axle collar. A good reliable collar for this purpose is made of malleable iron provided with a double adjusting bolt and having an overhanging lip engaging the axle bearing flange which keeps the dust and dirt from working into the wearing surfaces of the axle bearing.

Convenient Forms Simplify the Making of Cost Records

On Medium-Sized Roads with Limited Office Forces Collection and Preparation of Accurate Data for Costs of Construction and for Maintenance Work Present a Considerable Problem

BY A. J. STRATTON
Assistant Superintendent of Railways,
Eastern Pennsylvania Railways, Pottsville, Pa.

THE head of the maintenance of way department of the medium-sized traction company usually has but little time to devote to extensive office work. There are, however, certain records that for the benefit of all concerned must be compiled. A great deal of this information depends upon the wishes of the management, but some data are necessary for the use of the head of the department. Clerical help is often restricted to the services of a timekeeper or clerk of material and supplies with the joint use of stenographer with some other department. The result is that the head of the department must give a certain amount of time to the collection and preparation of these data.

On properties where costly valuations have been made or where the physical property of the company is carried on the perpetual inventory system, it is of great importance that a record be kept of the new material that goes into the property, its location, and the time of its use. On reconstruction work this may be most conveniently handled by the work order system. Normal maintenance work such as the installation of ties, the surfacing in open track, replacement of parts of special work layouts, painting and repair of bridges, repairs to bonding, and other kindred charges not usually made under work orders may cost more in a year than all of the reconstruction work, but except for the gross cost, the replacement of materials is lost sight of.

Three reports are in use by the maintenance department of the Eastern Pennsylvania Railways covering trackwork, bonding and welding and repairs to bridges and structures. These reports are made daily by the foremen and collected by the timekeeper who checks the material used and the amount of work reported. Every man on the payroll must be included on these reports. Track greasers and other employees working individually are grouped on one report unless the work performed by the individual is of sufficient importance to warrant an individual report. The trackwalker is an example of the latter. When the work reported is covered by a work order the report is filed under the work order number. Maintenance work is filed under line and division. These reports are made for use on a standard 5-in. x 8-in. card file.

REPORTS SUMMARIZED MONTHLY

At the end of the month reports are summarized and a brief narrative report is made to the general manager's office covering the activities of the department for the month. Lists of material are taken from these reports monthly and are grouped for record purposes under the proper division, and at the end of the year a complete report is made covering all changes to physical property.

From an operating standpoint the compilation of these reports has assisted in increasing the efficiency of the various employees. For example, the number of bolts used by trackwalkers increased 300 per cent the month following the use of the daily report. A study of the

FORM OF WORK ORDER REQUISITION

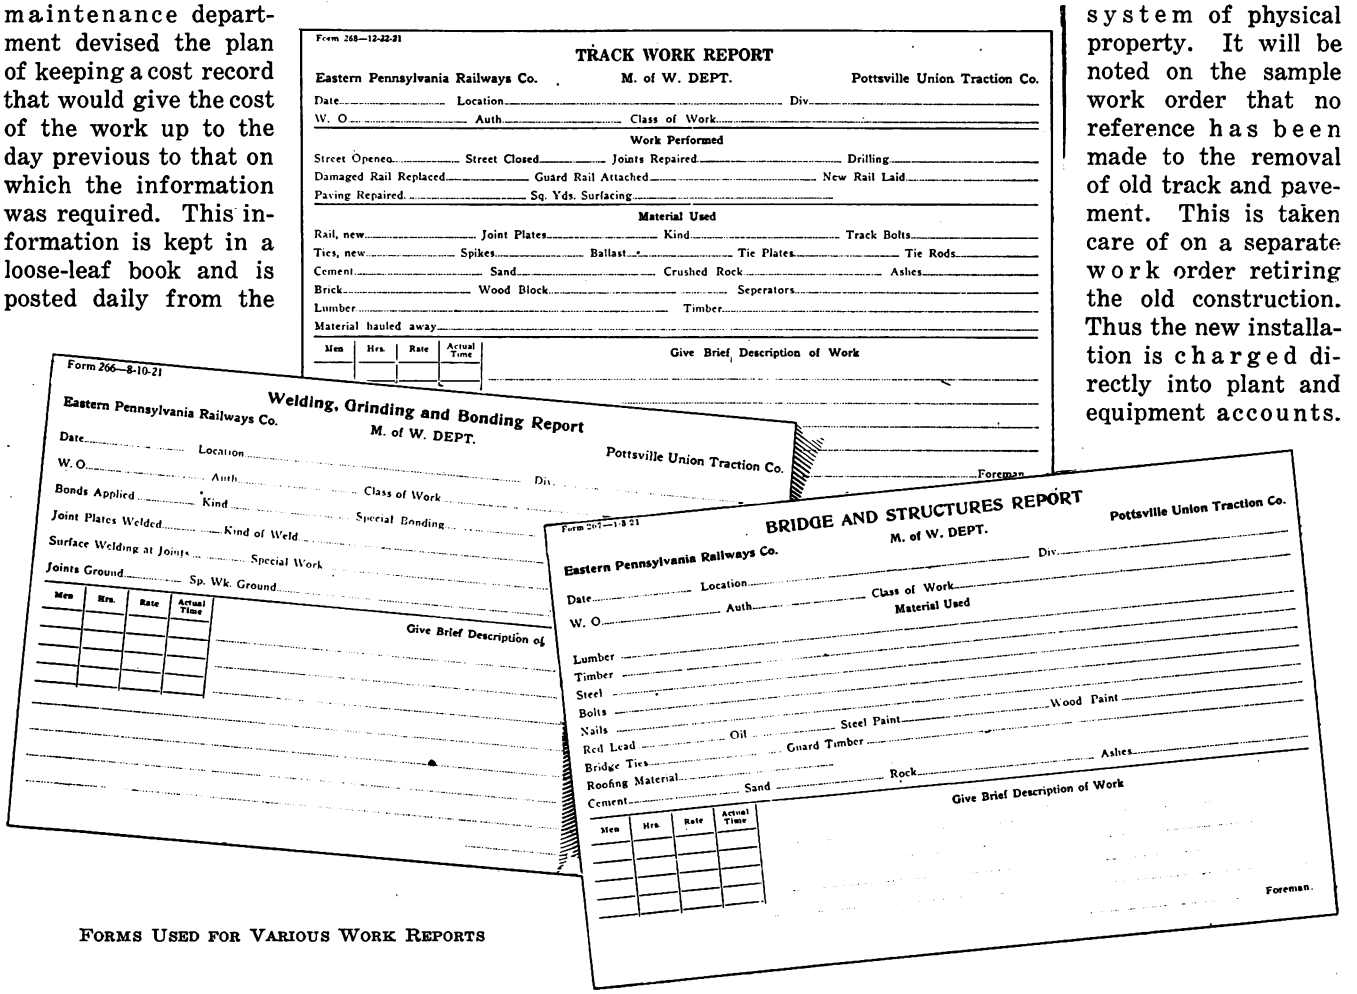
work of several foremen engaged in similar work showed a divergence in the production per man too great to have been influenced by local conditions. It was then possible to give those foremen making the poorer showing more supervision and assistance to raise the product of their gangs to a general average. The work report was not designed to take the place of the time report, but the space in the lower left-hand corner showing the number of men and the rates gives the head of the department an opportunity to check the quantity of work produced against the cost. It also gives him an instant perspective of the work of his department day by day, a view presented by facts alone and unsupported by local color in the shape of a plausible story by the foreman.

All engineers are interested in cost data. Auditing departments are usually ready to co-operate as far as they can, but they look upon this work as being of secondary importance to their routine work, with the result that the desired information is not obtainable until long after the completion of the work. All work of importance should be done under the work order system. The maintenance department of the Eastern Pennsylvania Railways prepares work orders that are given numbers by the auditing department. The main

Digitized by Google

items on the work order consist of the accounts affected by the proposed work, in the system of accounting used on the property. Accounts involving labor charges are subdivided so that the cost of the labor operation may be segregated and analyzed. The timekeeper's report each day carries the work order number with the account number and the subdivision of the account if such is used.

As the information from the accounting department was received too late to be of immediate benefit the maintenance department devised the plan of keeping a cost record that would give the cost of the work up to the day previous to that on which the information was required. This information is kept in a loose-leaf book and is posted daily from the time sheets and from requisitions for material. Not only is the actual expenditure included but the man-hours also. From an estimating standpoint the latter is of more value than the former in so far as the labor items are affected. From these data the average rate may be obtained, and in the event of an increase or decrease in labor costs a percentage may be applied to the average rate and the resulting new rate can then be readily applied to the man-hours so that a new result is obtained.



FORMS USED FOR VARIOUS WORK REPORTS

It has been found of great value to subdivide the items involving labor. It is not enough to know that the cost of track and roadway labor on a certain job was $1.05 per foot of single track. The operation of track laying may be divided into several divisions, all closely related but nevertheless clearly defined, without involving so great detail as to confuse the entire labor account for the job. The first subdivision of track and roadway labor is logically the handling and distribution of materials from the point of storage to the point of use. Track laying and the surfacing of track are two distinct operations, but unless care is used they may be confused in the time report. Joint welding is also a separate consideration. The cost of watchmen and the protection of the public as reflected on the time sheets in the labor cost of temporary crossings, for fire equipment at hydrants, etc., form no inconsiderable item in the cost of track construction in our city streets. Last but not least is the "miscellaneous" subdivision used to cover all of those unexpected expenditures that cannot be estimated by any stretch of the imagination.

Reference has been made to the perpetual inventory system of physical property. It will be noted on the sample work order that no reference has been made to the removal of old track and pavement. This is taken care of on a separate work order retiring the old construction. Thus the new installation is charged directly into plant and equipment accounts. It being quite improbable that in the event of a physical valuation being made at some remote period the book value would be accepted, consequently a careful record is made of all changes to physical property so that should a future valuation become necessary unit prices could be applied to quantities as shown in the perpetual inventory. Work orders are letter size and are filed at the completion of the work, together with the original estimate and supporting data, a complete plan of the work, also sections showing the type of construction, all correspondence, computations relating to paving bills or contract work, copies of all requisitions for material, and at the completion of the work a complete statement from the auditing department of all the expenses entering into the job. With this information available a reconstruction of the work for valuation purposes may be made at any time by applying such unit prices as may be desirable to use.

The use of the various forms also simplifies the clerical work necessary, provides a means for accurate checking of costs when the work is completed and decreases the probability of errors.

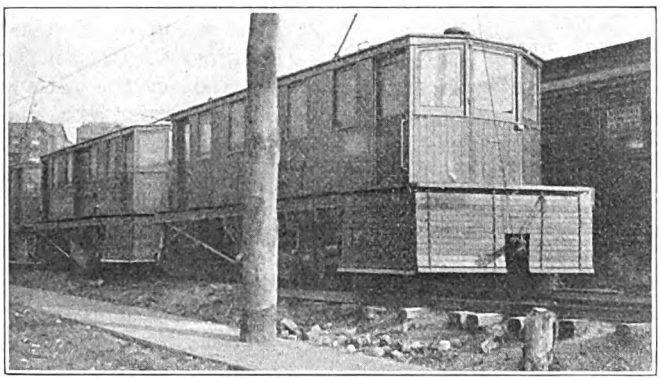
A More Substantial Substitute for Canvas Curtains on Snow Sweepers

MOST snow sweepers are equipped with canvas curtains to prevent the snow from being thrown too great a distance from the tracks. This scheme of restricting the throw of the rotary brushes has not been very satisfactory, however, on the Youngstown (Ohio) Municipal Railway. Hence, A. B. Creelman, master



WOOD SLATS REPLACE CANVAS SNOW PLOW CURTAINS

mechanic, devised the curtains pictured herewith. These consist of four lengths of ordinary fender support chain to which are bolted wood slats. No opportunity has been afforded to give these new curtains a real tryout, but it is believed that they will be much more effective and durable than the canvas curtains displaced.

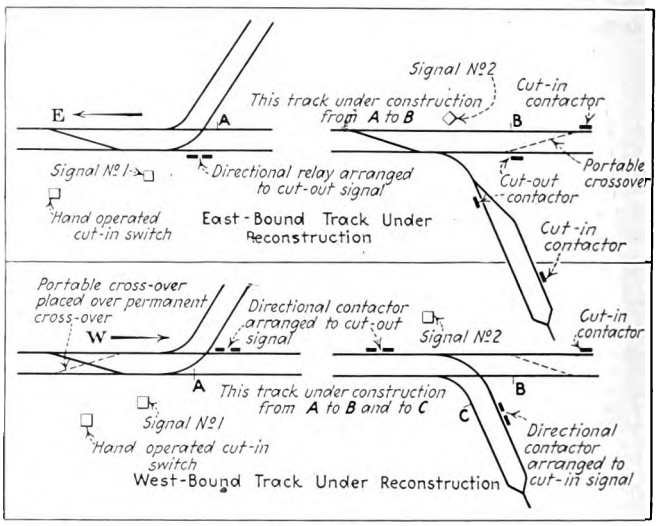
Safety Device for Circular Saws

ACCOMPANYING illustrations show a safety device which has been applied to several of the saw tables in the shops of the Third Avenue Railway, New York, N. Y. This device is the invention of Thomas E. Jenkins, mill foreman for the railway, and its use is proving of particular benefit in reducing accidents.

The device consists of a hinged metal piece which fits into the saw table around the circular saw. This is hinged at one end and in its normal position the end farthest from the hinge projects above the saw table slightly. It is held in its raised position by a small spring which acts on the underside of the guide. When lumber is being sawed the weight of the material forces the device down so that it is flush with the top of the saw table. When the cut has been finished the end of the board slides off the end of the safety device and this rises, so that the material cannot again be drawn back and engage the saw. If the material is drawn back toward the operator it will be forced to the side the distance that this projects out, so that there is no danger of accident. The accompanying drawing and photographs show how the device is installed.

Temporary Signal Installation Saves Flagman During Construction

IN THE reconstruction of track during last summer, the Youngstown Municipal Railway, of which J. B. Stewart, Jr., is general superintendent, found that the single-track operation necessary was greatly expedited and the cost of a flagman eliminated through the temporary installation of Nachod signals. The manner in which the signals were used is shown in the accompanying diagrams. One shows the location of the signals while the eastbound track was under construction and cars were operated in both directions over the westbound track and the other shows the signal installation



DIAGRAMS SHOWING HOW TEMPORARY SIGNAL INSTALLATIONS WERE USED TO PROTECT TRAFFIC DURING TRACK RECONSTRUCTION

for the opposite condition, that is, while the westbound track was under construction. On account of the three lines of traffic, some signaling or flagging protection was absolutely necessary and the automatic signals made a nice economy. The hand-operated cut-in switch shown was used instead of an overhead contactor and operated by a switchman, because it was necessary to have the switchman there anyway to look after the portable crossover and because the electric switch on the branch-off at this point was disconnected and the switchman also handled this.

LAKESIDE POWER PLANT, MILWAUKEE. THE COAL PREPARATION BUILDING IS AT THE LEFT

Milwaukee's Powdered Coal Station

First Great Generating Plant Equipped for Burning Pulverized Fuel in Operation for a Year—Station with Ultimate Capacity of 200,000 Kw. Has Many Interesting Features—High Over-All Economy Expected to Be Realized with Use of Low-Grade Coal

OUTSTANDING among many features of the new 200,000-kw. Lakeside generating station of the Milwaukee Electric Railway & Light Company is its design and equipment from the ground up for burning powdered coal. It is the first large railway and central station power plant to be so equipped and therefore marks a development the outcome of which is of greatest interest to large power generation companies generally. The decision to make this largely untried departure from common practice was based primarily on tests made on boilers equipped for burning pulverized fuel at the company's Oneida Street station in Milwaukee. The results of this test, related in ELECTRIC RAILWAY JOURNAL, page 473, Vol. 55, indicated that better efficiency could be expected with pulverized fuel than with stokers, particularly if a plant were built and equipped specifically for this kind of firing.

The new Lakeside power plant has now been in continuous operation since Dec. 15, 1920. Despite the fact that it went into service with a new organization of men largely unacquainted with pulverized-fuel systems, no interruptions attributable to the mechanical equipment have been experienced up to the present time. The company officials feel that the test results so far obtained give promise that the specified thermal efficiency of the station will be reached when the operating and design problems incident to such a radically new system have been mastered. The station economy expected of Lakeside will be that which will result from a combined boiler, furnace, superheater and economizer efficiency of 88.15 per cent, using Illinois coal of approximately 11,000 B.t.u. heat value as received.

Other features of the new Milwaukee power plant are the unique circulating water system and $400,000 rubble mound in Lake Michigan; the location of the plant in a deep excavation to reduce the lift of circulating water with the attendant construction difficulties, and the practical completion of the first section of the station in less than a year. The ultimate development of the plant will reach an hourly capacity of 160,000 kw. with an installed capacity of 200,000 kw., 40,000 kw. being the initial installation and two additional 80,000 kw. sections the future plan. The final boiler capacity will be three times the initial installation and will comprise twenty-four 1,306-hp. boilers.

Work has just recently been started on the installation of an additional turbo-generator unit. This will be of 30,000 kw. capacity, and as it will be run in conjunction with one of the two 20,000-kw. units, no additional boiler capacity is needed for the time being.

The following matter descriptive of the new plant is abstracted from three papers presented before the Technical League of the Milwaukee company by R. H. Pinkley, John Anderson and G. G. Post, respectively engineer of way and structures, chief engineer of power plants and electrical engineer.

Owing to the rapidly increasing demand for electrical energy in the Milwaukee district, the Milwaukee Electric Railway & Light Company found it necessary, in 1915, to begin plans for increasing its power producing capacity. A study made at that time indicated that the best plan would be to construct an entirely new power plant which would provide the necessary increased capacity and would ultimately relieve the existing power plants of the major portion of their load. The general plan was to make provision for a 200,000-kw. plant, building the first section for 40,000 kw. Due to the experience with the old plants located in the heart of the city with an inadequate water supply, restricted coal and ash handling facilities and where smoke is objectionable, a suburban location was considered preferable. After canvassing the district for the most suitable

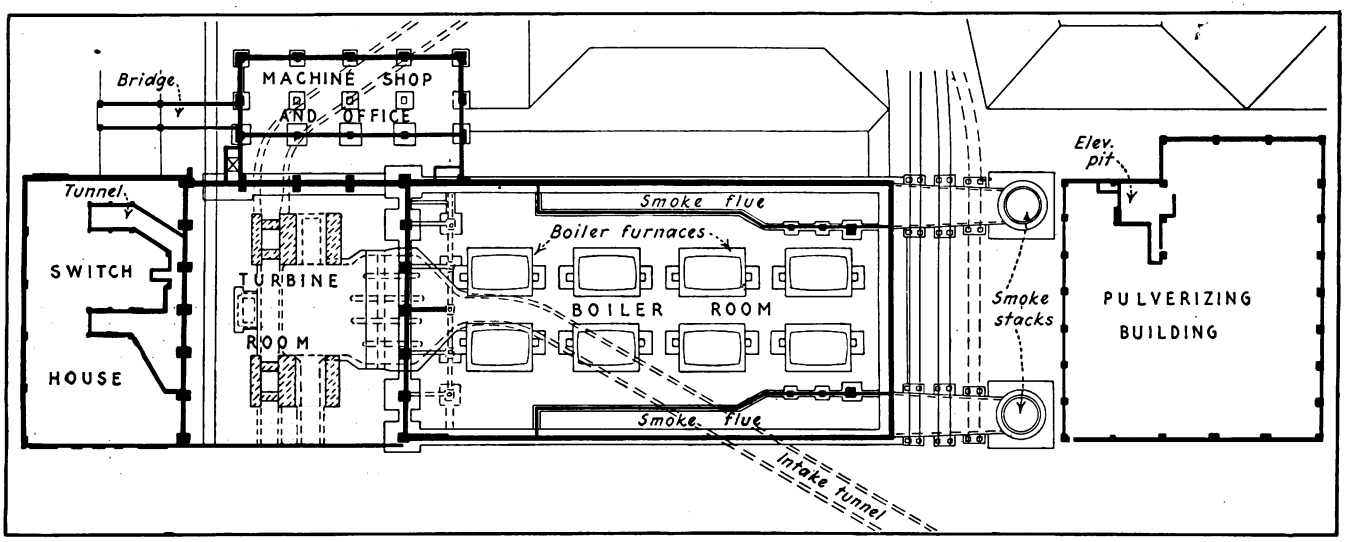
Digitized by Google

Digitized by Google

location, the Lakeside site, situated on the shore of Lake Michigan about 1 mile south of the south city limits of Milwaukee, was chosen. This site is not far from the electrical center of gravity of the company's load and is adjacent to the most important industrial centers in the district served.

Accordingly, in 1916, land was purchased, including 6,000 ft. of frontage on Lake Michigan and a railroad right-of-way connecting to the Chicago & Northwestern Railroad. Up to that time coal for power purposes was being received by the company entirely by lake transportation so that coal docks and a protecting harbor were considered essential features of the plant.

Owing to the conditions occasioned by the World War, in 1917 it was found impossible to go ahead with the project. The company set aside all thought of continuing and directed its efforts toward getting the utmost capacity out of every piece of the existing generating equipment. But at the end of 1919 the increased load made it imperative to begin again. Accordingly, on Dec. 22, 1919, orders were issued to proceed with the plans and rush through the construction of the first section of the new plant, including two 20,000-kw. turbine units, so as to have this capacity in readiness, if possible, to deliver power on Nov. 1, 1920. The entire engineering, designing and drafting work was done by the company's own forces and the work was executed under the direction of the company's engineers, the company acting in the capacity of general contractor and sub-contracting the various items of the work.



PLAN OF MAIN BUILDINGS OF POWER PLANT

The power plant proper is made up of three parts—the switchhouse, the turbine room and the boiler room. The switchhouse at the west end is directly joined to the turbine room, but separated by a solid wall except for necessary door openings and a glass panel over the bench board on the second floor. The south wall of the turbine room is a temporary one to be removed when the second unit is added. An auxiliary bay forms the connecting link between the turbine and boiler rooms, separating them to a certain extent but not interfering with the unity of design of the whole structure.

Just north of the turbine room is a two-story structure, 95 ft. x 52 ft., on the lower floor of which is the repair shop, completely equipped to handle work required in maintaining such a plant. On the second floor are the offices of the operating engineer and of the testing department. There is also found there a fine room, 47 ft. x 52 ft., for the use of the Employees' Mutual Benefit Association. To the east of the power plant is the pulverizing plant, 108 ft. x 125 ft., its east end reaching to the edge of the bluff at the Lake Shore. It is equipped to do pulverizing for the entire plant when completed. The stacks rise direct from the ground from a location between the boiler room and the pulverizing plant, each reached from the boiler room through an underground flue 8 ft. x 11 ft. average size. To the north of the pulverizing plant, distant about 400 ft. from it and placed against the side of the bluff to take advantage of the slope to secure a gravity flow for the coal, is the car-dumping and coal-crushing plant, from which the coal is carried by a covered belt conveyor to the pulverizing plant. This also has been planned to meet the requirements of the completed 200,000-kw. plant.

The ultimate 200,000-kw. plant will require water for condensing purposes at a rate of 360,000 gal. per minute or 518,000,000 gal. per twenty-four hours. In order to secure this supply from the lake without going out into deep water, it was decided to build a rubble mound inclosure extending approximately 485 ft. out from the shore and 850 ft. long to provide, in effect, a pond of still and clean water for this purpose. It is the function of the rubble mound to break the force of the waves and prevent rubbish, sand and ice from washing into the intake, thus permitting the intake tunnel to be terminated near the shore line. The discharge tunnel is arranged to discharge either inside or outside of this basin, so that in the winter time the warm discharge water can be used to prevent the basin from freezing. This rubble mound is designed with a height of 8 ft. from the normal surface of the water, with a width of 10 ft. on the top and a slope of 2 to 1 on the lake side and 1½ to 1 on the inner face. As the outer wall is in over 15 ft. of water, the base at the maximum point is 91 ft. wide. The core of this rubble mound consists of quarry run limestone having a minimum size of 3 in.; the cover stones weigh 500 lb. up to 15 tons each. All stone except the inner core are of granite from Wisconsin quarries and are keyed in rubble fashion. There was required in the construction of this rubble mound more than 80,000 tons of stone, the core stone being placed by dumping from

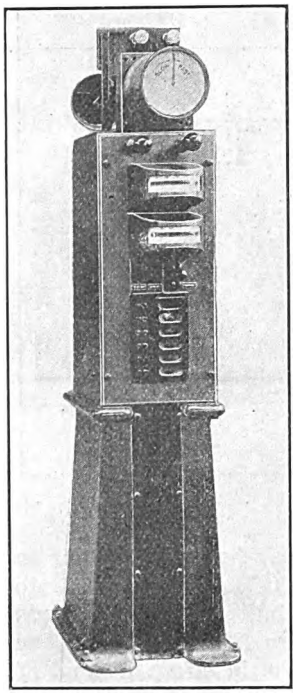
Digitized by Google

scows and the heavier stone being handled by derricks mounted on barges.

The intake tunnel, which has its top 5 ft. below the water level, is terminated about 50 ft. beyond the water line at the lake shore and a channel was dredged out 15 ft. in depth leading up to this tunnel, which required approximately 7,000 cu.yd. of dredging by dipper dredge. This tunnel is protected at the lake end by a timber ice boom, a submerged sheet pile weir having its top 5 ft. below the surface and a steel bar screen with 6-in. spacing. Inside the plant, the circulating water passes through revolving screens having ½-in. mesh, into a large suction chamber between the foundations of turbines Nos. 1 and 2. Gate houses are provided at the lake termini of both intake and discharge tunnels, so that stop logs can be placed for shutting off the water at these points.

TUNNELS FOR CIRCULATING WATER

Over 1,100 lineal ft. of tunnel and 150 ft. of construction shaft were required for the circulating water system, together with gate houses and a large screen and intake chamber below the condensers and pumps in the turbine room. This location of the traveling screens was decided upon because it saved excavation, permitted the use of overhead crane for lifting the screens for inspection or repair, and gave better operating supervision than if located at the tunnel mouth. As stated above, these tunnels have 10 ft. inside diameter and have a minimum thickness of concrete lining of 12 in. and an average thickness of 18 in.



SIGNALING AND SYNCHRONIZING PANEL FOR EACH MAIN GENERATOR

At the site of the plant, the general level of the ground averages about 50 ft. above the lake level, with a steep bluff at the lake shore. It was desired to provide a suction chamber at the lake level, and to place the condensers at such a level that the water could be circulated through them with a minimum lift, as otherwise an enormous amount of energy would be expended in raising the large quantity of water required for condensing purposes. This necessitated placing the condensers at a low level, which, in turn, determined the level for the turbines and boilers. The deepest excavation required was to an elevation 20 ft. below lake level for turbine foundations and intake chamber, placing the main condenser floor at elevation plus 1 and the main boiler room and turbine floor at elevation 32 or about 18 ft. below the ground level.

These requirements, together with the inclined cuts for railroad tracks, necessitated excavating approximately 131,000 cu.yd. of soil from a pit having a maximum depth of 70 ft. below the surface of the ground, resulting in an exceedingly difficult grading job.

The main smoke flues leading from the boilers to the smokestacks are in the form of concrete boxes approximately 8 ft. high and 11 ft. to 18 ft. wide. Two reinforced concrete smokestacks were constructed, having a height above foundations of 220 ft., inside diameter at top 15 ft. and bottom 16 ft. 6 in. These smokestacks were lined with a 4-in. concrete lining for a height of 60 ft. The main shell of the chimney was 5 in. thick at the top and 16 in. thick at the bottom. The concrete foundation for each chimney was 28 ft. square and 5 ft. thick, heavily reinforced. Each of these chimneys was constructed in about sixty-four days.

The construction of the main buildings involved the use of about 2,250 tons of structural steel, a part of this being in the form of steel plate coal bunkers, steel supports for machinery, galleries and stair work. In the pulverizing building, the steel frame was designed for supporting overhead coal bunkers having a capacity of 3,500 tons.

The coal dumping and crushing plant presented peculiar construction difficulties, being located on the slope of the bluff at the lake shore. The coal cars are brought in to the dumper on the high level at elevation 56. The crushing building is surrounded on three sides by high retaining walls, the west wall of the building forming a retaining wall nearly 50 ft. high and the two end walls being braced to the building floors by means of concrete struts, thereby greatly reducing the spans for the concrete and the materials required for the walls.

The quantities of principal parts of the work performed and materials used may be summarized as follows:

Cubic yards of rough excavation	131,895
Cubic yards of finish excavation	18,500
Miles of railroad track laid	5.5
Tons of stone placed in rubble mound	80,294
Cubic yards of concrete	25,000
Tons of reinforcing steel	1,250
Bags of cement	155,000
Feet of lumber	2,326,000
Number of brick	1,445,000
Tons of structural steel	2,237
Lineal feet of 10-ft. tunnel	1,145

MECHANICAL EQUIPMENT OF LAKESIDE POWER PLANT

The main units at Lakeside station consist of two 20,000-kw. turbo-generators, 13,200-volts, three-phase, 60-cycle, operating on 250 lb. steam pressure, 200 deg. F. superheat, with 1 in. absolute back pressure. The auxiliaries for each unit comprise one 35,000-sq.ft. three-pass condenser; one 24-in. 18,000-gal.-per-minute circulating water pump driven by 170-hp. motor; one 24-in. 18,000-gal.-per-minute circulating water pump driven by 170-hp. steam turbine; one condensate pump driven by a 50-hp. motor; one turbo-air pump driven by 100-hp. motor; one steam jet air pump, and one air waster.

Each condenser is thus provided with two half-capacity circulating water pumps of 18,000 gal. per minute each, one being motor driven and the other connected to a steam turbine. Both of these pumps will be required during the summer months when the water is warm, but only one will operate during the winter.

An air washer is installed for each generator which draws its supply of air from the main turbine room, eliminating a separate screen house and an air duct to outside the building. Suitable means of admitting air into the turbine room from the outside during the cold weather has been made in the monitors on the roof, while during the milder weather it is admitted through ventilators in windows. The generators discharge the air into the basement of the boiler room through sheet metal ducts, thereby using the heated air to augment the regular supply to the boiler furnaces. Provision was

Digitized by Google

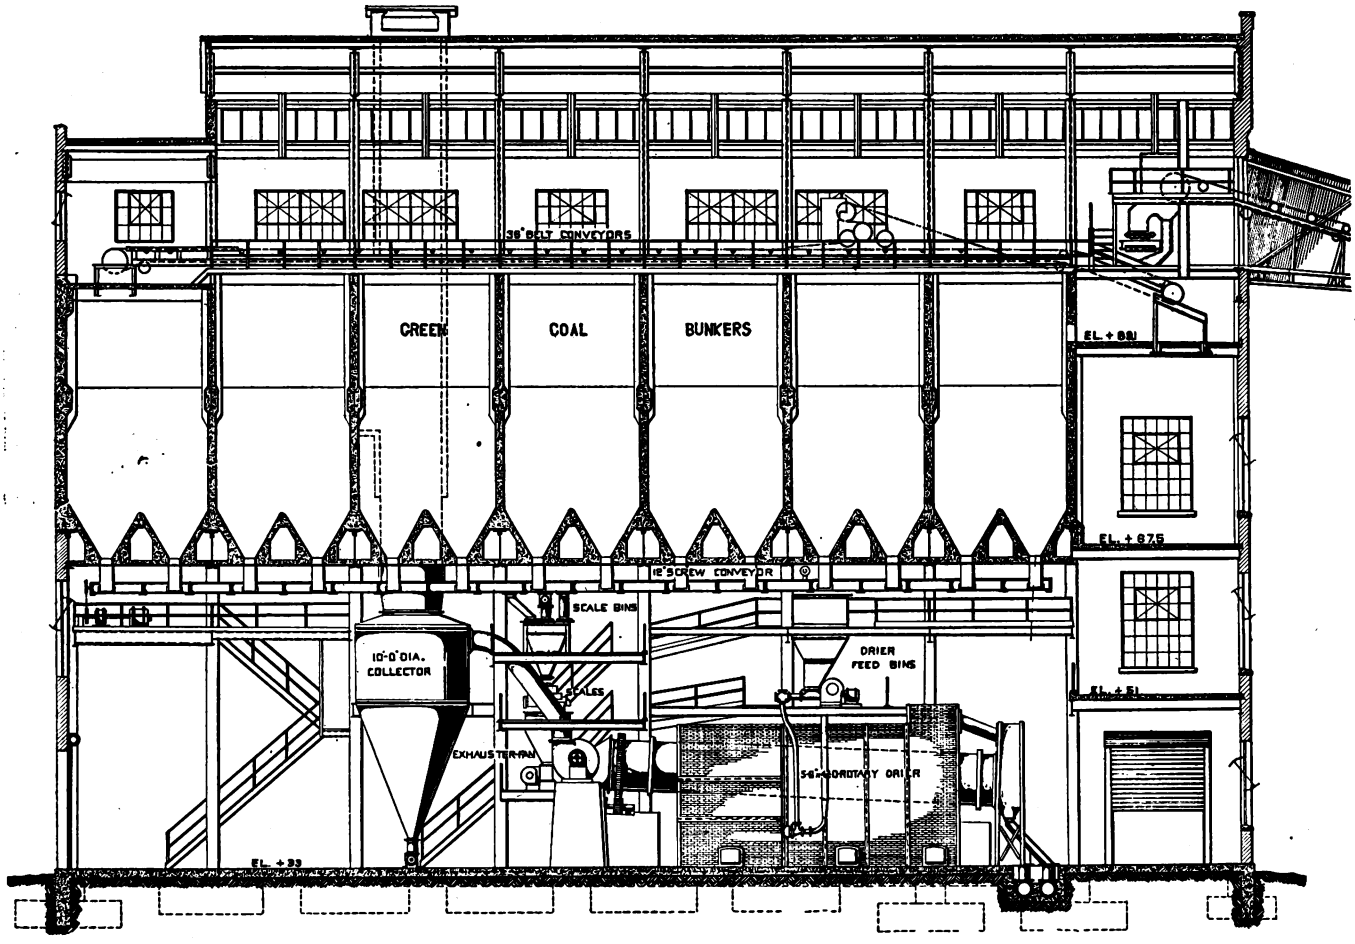
made in these discharge ducts to by-pass a sufficient amount of air back into the turbine room during cold weather so as to temper the air and reduce the openings of the ventilators to a point that will give a proper turbine room temperature. This design of air ducts for generator cooling gives the best results with least investment cost, and also provides for noise reduction.

Automatic dampers have been installed in both the air intake and discharge ducts as close to the generator as possible as a means of fire protection. These close when an unusually high temperature is attained, such as might be occasioned by fire. Arrangement will also be made for admitting carbon tetrachloride, or other fire extinguishing liquid. The station is equipped with the

Each boiler is fitted with a Foster superheater, having a capacity to increase the temperature of 90,100 lb. of steam per hour from 411 deg. F. to 611 deg. F., thus realizing a superheat of 200 deg.

The boiler furnaces are arranged for burning pulverized fuel, which is fed into them by screw feeders from pulverized fuel storage bins overhead. Six out of the eight boilers are equipped with the Lopulco system, that being the design which was tested out in Oneida Street and found satisfactory. Two boilers were fitted with the Fuller system for experimental purposes.

There are installed eight Sturtevant economizers of 7,603 sq.ft. heating surface, one for each boiler, arranged with by-pass connection to the stack for flue



LONGITUDINAL SECTION THROUGH PULVERIZING PLANT

necessary pumps for sanitary service, which pumps are so connected as to be available for reserve feed tank service. An air compressor for cleaning generators and other electrical equipment, operating pneumatic tools, boiler tube cleaners and general service also forms part of the station equipment.

INITIAL BOILER ROOM EQUIPMENT

There were installed eight 1,306-hp. Edge Moor boilers, designed for 300 lb. pressure. The boilers are arranged four in each of two rows. They operate normally at 200 per cent of rating. At this rating three boilers are sufficient to furnish steam for one 20,000-kw. turbine, leaving two spare boilers to allow for cleaning and maintenance. This number of boilers will also be necessary in order to furnish steam in the future for the larger generating units which are expected to be installed in the next section built.

gases. Each economizer is equipped with an induced draft fan driven by a steam turbine. The economizer receives the feed water at 140 deg. F. temperature and raises it to 255 deg. F.

The condensate from the condensers on the large turbines is pumped to an overhead hot well tank, the water from which feeds by gravity to two Hoppes heaters, maintaining a fairly constant pressure on the supply pipe thereto. The heaters raise the temperature of the feed water from approximately 80 deg. to 140 deg. F. The overhead hot well tank is equipped with an overflow to a reserve feed water basin located below the basement floor of the boiler room. The water is reclaimed from this basin by means of centrifugal pumps and is delivered to the overhead hot well tank as needed. From the heaters the feed water passes by gravity through an 800,000 lb. per hour "V" notch feed water meter of extra storage capacity. This meter is located

Digitized by Google

on the floor above the feed pumps and gives a 15 ft. suction head on the pumps.

There is also installed a common test line with connections from condensate pumps on each condenser which discharges into a test meter of the "V" notch type of 300,000 lb. per hour capacity, from which it flows by gravity into the heaters. The test meter is located on the floor level with the overhead hot well tank.

The feed water pumps installed consist of two 6-in. centrifugal 650-gal.-per-minute feed pumps driven by 250-hp. steam turbines and two 4-in. centrifugal 400-gal.-per-minute feed pumps driven by 150-hp. motors. The maximum quantity of feed water required for eight boilers operating at 200 per cent rating is 1,254 gal. per minute. This leaves two motor-driven pumps or one steam-driven pump as spare. These pumps are located on the boiler operating floor level at the west end of the boiler room.

As the quantity of ash from pulverized fuel furnaces is very small and very fine it is easily conveyed by means of steam jet ash conveyors. A system of steam jet conveyors is installed with main runs leading to furnace ash pits and branches leading to combustion chambers at the rear of boilers and soot pits under the economizers. This conveyor discharges into an ash bunker which spouts into cars on the railroad track at the east end of boiler room.

Plant for Preparing Coal

The coal bunker is located in the pulverizing plant and has a storage capacity of 3,400 tons, which is slightly more than three and one-half days supply for maximum operation of all boilers in this section. The coal is taken from this bunker by means of three screw conveyors, which convey it to automatic weighing scales. From the scales it is taken by another set of screw conveyors and fed into the dryers. With this arrangement it is possible to take coal from any point in the bunker and deliver it to any one of three dryers. It also allows the coal to be weighed just before reaching the dryers, which is much to be preferred over the method of measuring coal as it enters the coal bunkers inasmuch as it permits of a close daily check on coal consumed in the plant.

Three dryers capable of reducing the moisture content in the coal from 10 per cent to 1 per cent have a capacity of 17½ tons per hour each. From the dryers the coal is discharged into screw conveyors, which convey it to bucket elevators, which in turn deliver it to other screw conveyors to be transferred to dried coal bins over the pulverizing mills.

Eight mills each having a capacity of six tons per hour pulverize the coal so that 85 per cent will pass through a 200-mesh screen and 95 per cent through a 100-mesh screen. The mills are each direct connected to a 100-hp. motor. Each mill is also provided with a fan for separating the pulverized particles which have been reduced to the necessary fineness, discharging them into cyclone separators overhead, where the fuel is separated from the air and falls by gravity into a screw conveyor located at the base of the separators. This conveys it to the pulverized fuel bins. From these bins it is conveyed to fuel bins in the boiler room by means of the Fuller-Kinyon system of transporting pulverized material.

Coal is removed from cars by means of a rotary car dumper of the Robins-Scherzer type and dropped into a track hopper fitted with bottom shaker feeders. Belt conveyors carry the coal from the track hopper over a magnetic pulley for the removal of such iron as may be in the coal. It is then passed through a two-roll crusher and hammer mill, where it is reduced to ½ in. size. It next discharges directly onto an inclined belt, which carries it to the distributing belts over the coal bunker in the pulverizing plant. There are three such distributing belts over the bunker, each having a traveling tripper which discharges coal at any point along the length of the belt.

The crusher and hammer mill have a capacity of 150 tons of mine run coal per hour. The conveyors are 36-in. belts, having a capacity of 250 tons per hour at 250 ft. per minute. Provisions have been made for the installation of another crusher unit which will double the capacity when required in the future. Provision has also been made for the future storing of rail coal on the dock by means of by-passing the crusher and conveying the coal by belt to the dock, where it will be taken up by coal bridge and stored. Coal from the dock will be reclaimed by reversing the operation and delivering coal reclaimed into crushers. Lake coal will be taken into the plant in the same way.

Method of Maintaining Heat Balance

It was decided in order to obtain a well-balanced heat condition for use in connection with heating feed water to a suitable and regular temperature before introducing it to the economizer to install steam drive for boiler feed pumps, induced draft fans and half of circulating pump capacity, leaving the balance of steam required for heating feed water to be supplied in varying quantities by the house unit, or so-called heat balancer. All other auxiliaries are direct motor driven.

Electrical Features of New Power Plant

Current at the Lakeside plant is generated at 13,200 volts and all outgoing high-tension lines operate at 13,200 volts and leave the station underground. Many of the lines have been connected to the Commerce Street power plant and other stations in Milwaukee, but others will be connected to an outdoor transformer station near at hand, which will step the pressure up to 26,400 volts for transmission to distances in general exceeding 6 miles. It is possible that at a later date some energy will be stepped up to 66,000 volts or more for transmission to remote points.

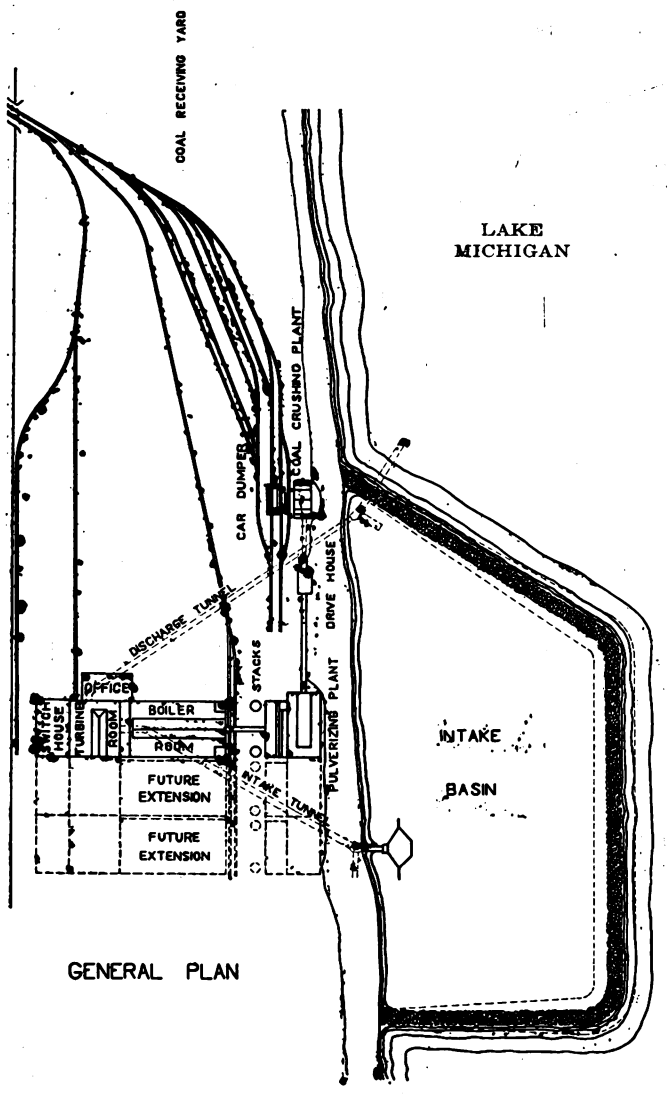
The generators in the initial installation are General Electric Company, 20,000-kw., 0.8-power factor, three-phase, 13,200-volt, 60-cycle, 1,800-r.p.m. machines. Excitation for the generators is furnished at 240 volts and is normally supplied for each generator by its own direct-connected exciter. Emergency excitation is furnished from the d.c. station power service. The oil switch control system is 120 volts d.c., regularly supplied from a separate storage battery and special motor-generator sets. If necessary the oil switch control may be transferred immediately to the battery on the d.c. station power system by connecting it across one-half of the cells.

The 13,200-volt main connections and circuit breakers are located exclusively in the switch house. There are two main bus bars with sectionalizing switches between generator sections. Possible future sectionalizing reactors will be installed. To promote safety and prevent electrical trouble from spreading, all 13,200-volt bare copper and cables are taped with approximately ¼ in. of varnished cambric and covered with a layer of

Digitized by Google

cotton tape impregnated with a fire-resisting substance. Each generator may be connected to either main bus through selector oil circuit breakers. Feeders are connected in groups of three to feeder group bus bars, which in turn may be connected to the main bus bars through group circuit breakers.

The arrangement of equipment in the switch provides for reliability of operation. Some of the features of the arrangement of apparatus are these: The main circuit breakers of different generators are separated a considerable distance from one another with from three to



GENERAL LAYOUT OF LAKESIDE POWER STATION FACILITIES

four groups of feeder breakers between them. Because of this it will be difficult for trouble on one set of generator breakers to be communicated to the breakers of other generators. The group breakers of any one feeder group are located as far as possible from one another, one being at one end and the other at the opposite end of the feeder section. This makes it unlikely that trouble in one group breaker will involve the other group breaker on the same feeder group.

Oil circuit breaker mechanisms are located on the fourth floor, oil circuit breakers on the third floor, main bus bars, potential transformers, feeder current transformers, feeder reactors and feeder group bus bars on the second floor, and generator current transformers, lightning arresters, feeder potheads and disconnecting switches on the first floor. The generator leads pass in a nearly horizontal direction from the generator foundation through a tunnel underneath the switch house and then rise vertically to the generator selector bus on the second floor. The generator leads each consist of two 1,000,000 circ.mil, single-conductor, stranded copper cables insulated with $\frac{7}{16}$-in. cambric and covered with a flame-proof braid. Although these cables are in a dry place and insulated for the operating voltage they are nevertheless supported clear of everything on porcelain bus bar supports spaced approximately 3 ft. apart. Cables are continuous without joints from the generator to the current transformer on the first floor. From the current transformers to the main circuit breakers the leads consist of two $\frac{1}{4}$-in. x 3-in. copper bars. The main generator oil circuit breakers are General Electric type H-6, rated at 2,000 amp., 15,000 volts and capable of rupturing 18,000 amp. at the rated voltage. Each pole of these breakers is located in an entirely separate compartment and the crossheads are in another separate compartment underneath the operating mechanism on the fourth floor. The main bus bars on either side of the room consist of two or more $\frac{1}{4}$-in. x 4-in. copper bars suspended from the ceiling on substantial porcelain insulators and separated from one another by gypsum barriers 2 in. thick. The main bus bars are on opposite sides of the room, making it practically impossible for trouble on one set of bus bars to involve the other.

The feeder group bus is connected between the group oil circuit breakers, one of which is directly over the west main bus and the other over the east main bus. Feeders are tapped off between the group circuit breakers. Conductors run from the feeder bus through porcelain bushings in the wall, thence upward to the feeder oil circuit breaker and down through current transformers and feeder reactors to disconnecting switches and cable terminals. Group oil circuit breakers are of the same type as the main generator bus bar, but rated 800 amp. and having a rupturing capacity of 18,000 amp. The crossheads, as in the case of the generator breakers, are located in a separate compartment underneath the operating mechanism on the fourth floor. Feeder breakers are General Electric type H-3, rated 300 and 500 amp., depending upon the size of feeders connected, and will rupture 10,000 amp. at 15,000 volts.

STATION SERVICE POWER

On account of the fact that some of the motor-driven plant equipment, such as that for coal crushing and pulverizing, is located a considerable distance from the source of supply, it was decided that such auxiliaries should operate at 480 volts. It was further decided that some d.c. auxiliary service should be furnished on account of the turbine room crane, motor-operated steam valves, car dumper, magnetic pulley and certain operations requiring variable speed. To make this service available as an emergency source of excitation, 240 volts was selected. To simplify the station power service, the control of main emergency auxiliary feeders was placed under the control of the switch house operator, who handles this system exactly as a substation supplying a group of customers. For the purpose of adding to the safety of workmen, safety switches have been adopted for use at the various motors. All bare copper bus bars, cable and wire are insulated adequately to safeguard the service.

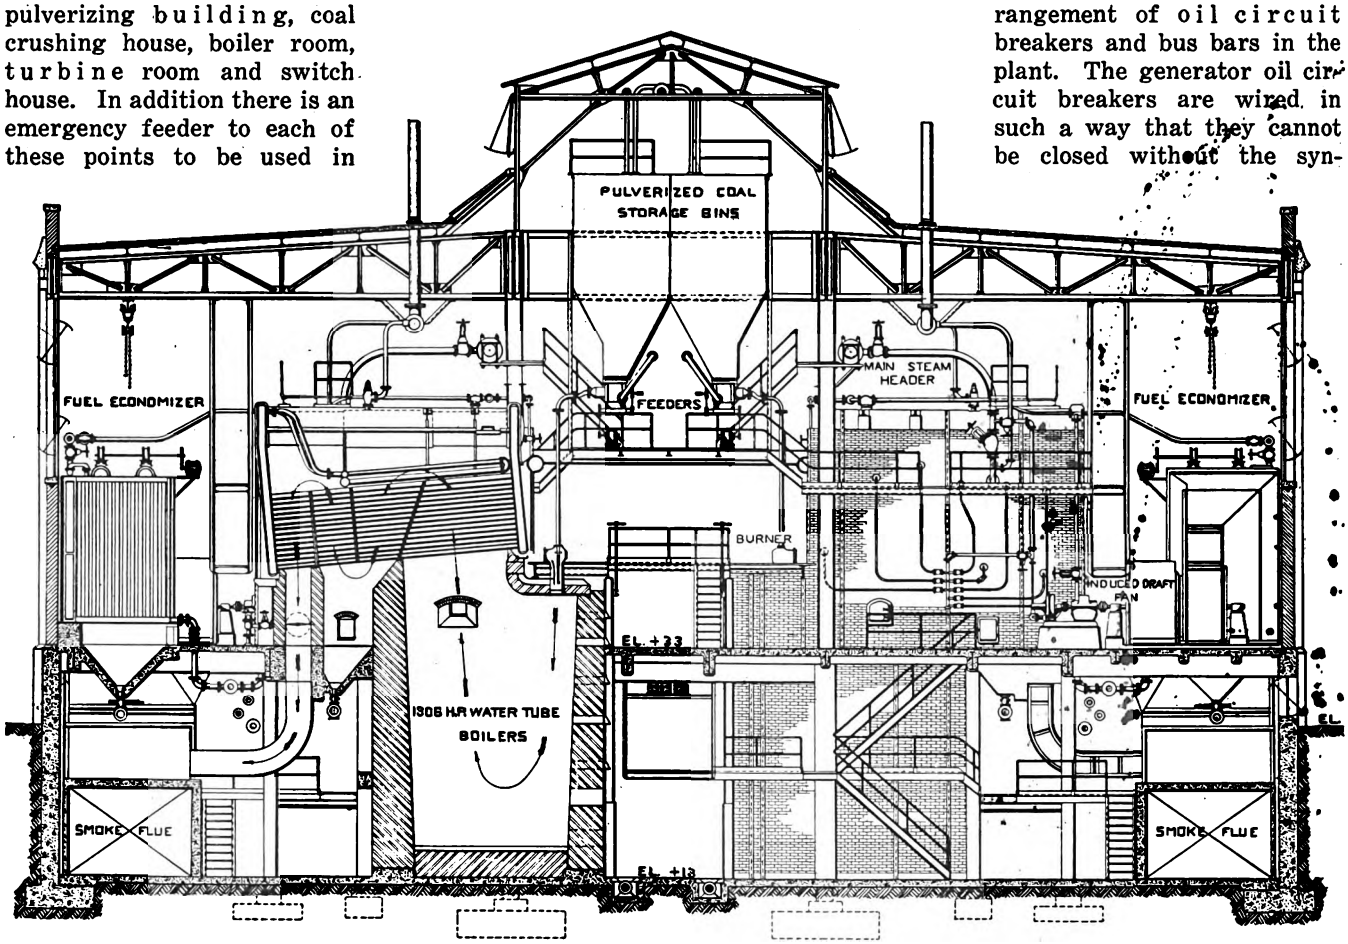
Service for a.c. auxiliaries is furnished by two 3,000-kva., 13,800-13,200-volt primary, 480-volt secondary, 60-

Digitized by Google

cycle, three-phase, water-cooled transformers, one serving as a reserve for the other. These transformers are located in the turbine room basement underneath the mezzanine floor on which the generator field and exciter rheostats, neutral oil circuit breakers and other electrical auxiliaries are located. Located as they are, the 13,200-volt cables supplying them are short and do not pass through any part of the plant where they may be subjected to too much heat and consequent liability of trouble. Bus bars, transformer circuit breakers and oil circuit breakers on feeders to distribution points throughout the plant are all in duplicate. There is one main feeder to each main division of the plant, such as pulverizing building, coal crushing house, boiler room, turbine room and switch house. In addition there is an emergency feeder to each of these points to be used in case of trouble on the main feeders. The auxiliary bus bars consist of ¼-in. x 4-in. copper bars supported on substantial porcelain insulators in horizontal compartments above the oil circuit breakers on the auxiliary feeders. Large air brake circuit breakers are used instead of oil circuit breakers on the secondary side of the auxiliary transformers. These breakers are provided with reverse power relays so that with both transformers in operation trouble in a transformer or on its primary breaker will cause the proper breakers to open, thereby clearing the trouble without interfering with the service. Station distribution switchboards, located in various parts of the plant, are constructed in such a manner as to make it possible to kill half of them for work to be done without interfering with service on the other half.

The general arrangement of the d.c. auxiliary supply is similar to that of the a.c. This system is supplied by two 300-kw. motor-generator sets, one serving as reserve for the other and each consisting of a 480-volt, 60-cycle, squirrel cage induction motor, direct connected to a 250-volt d.c., 1,200-r.p.m. shunt wound generator. These sets are supplied from the 480-volt a.c. station power system. To guard against a shut down, a 150-cell G-15 battery in G-23 tanks is kept floating across the 240-volt bus. The main d.c. busbars and switches are located on a switchboard in the operating room. Each main feeder is provided with an ITE circuit breaker and at the various distribution panels and cabinets in the plant fuses are provided on branch circuits.

The main station wiring is represented by mimic busbars on the bench sections and the arrangement of control switches is such as to conform exactly with the arrangement of oil circuit breakers and bus bars in the plant. The generator oil circuit breakers are wired in such a way that they cannot be closed without the synchronizing plug being in its receptacle. The same is true of feeder oil circuit breakers. The signaling equipment on the bench board is exactly the same as that on the instrument panel at the turbine throttle. Since the switchboard operator is in an entirely different room from the steam engineer, it is necessary for them to make use of signals in bringing machines up to speed and cutting them in or out.



CROSS-SECTIONAL VIEW OF THE BOILER PLANT

There are three feeders per panel, each panel corresponding to a feeder group. The equipment per feeder on each panel consists of three ammeters, one voltage indicating lamp, one synchronizing receptacle, one pull button control switch with red and green indicating lamps and three overload induction relays with test links.

To make it possible to communicate with all parts of the plant at any time of the day or night with the minimum of operating expense, an automatic telephone system has been installed. The exchange controls twenty-five circuits with an ultimate capacity for 50.

Letters to the Editors

The Trolley Shoe or "Slide" at Low Speed

LEAGUE CITY, TEX., April 8, 1922.

To the Editors:

I have read considerable discussion on the merits of the sliding contact shoe as against the standard trolley wheel, but there is one feature of the case as I have experienced it that has never been touched upon in anything I have read or heard. This is the unusually great wear on the trolley wire by the sliding shoe at slow speeds. And while this might not be a deciding factor on high speed roads it would have a bearing in selecting a current collector for city cars, which of necessity must run slowly in the downtown sections, or for interurbans, which use city lines for entering the city.

My experience has been exclusively on high-speed interurban trolley,* and about three years experience proves conclusively that the wear on the trolley wire is very much greater at slow speed with the slide than with the wheel. And it would seem that the extra wear is due almost entirely to increased friction at slow speed. This is proved by tests which I have made.

For a period of about seven years we used wheels, and micrometer measurements of the trolley wire wear at intervals revealed no noticeable difference in the wear at points of high and slow speed, but after adopting the contact slide this became very noticeable without measurements. This extra wear was so great that in less than three years it was necessary to renew the wire at points where frequent stops were made, as in front of stations. And the first places to be renewed were those of most frequent stops. It has been suggested that the increased wear might be due to increased current draft in starting, but this is disproved by the fact that increased current draft with the wheels showed no difference in wear.

Another proof that it is increased friction is the fact that at high-speed points the wire takes on a gloss on the underside when the slide is used while the gloss is entirely absent where the speed is slow, indicating that the wire is being cut away with every passing trolley. The distance of increased wear is not very great, however, it being necessary to renew but little more than 150 ft. of trolley wire at each place renewed. This is due to the rapid acceleration of the trains in starting. I have also noticed that the slide is more destructive of trolley wire fittings—as splicing sleeves, section insulators, frogs and crossovers—than the wheel. This is due to the fact that a smooth under-run is never secured on these devices, and a hammer blow results with the passing of every slide, which forms a "shoulder" which is aggravated with each blow struck. The wheel *rolls* upon this uneven place with the result that the wear is not so great. This hammer blow tends also toward crystallization of the wire, making breaks at the entrance of the wire more liable. The tendency to run the slides after they are badly worn also is destructive to fittings, more so than the wheel, due to the fact that the slide takes on a more restricted groove than the wheel. After passing the end of a fitting the shoe has an upward thrust, and the resulting blow may tend to crystallize the wire.

This is not to be construed as being written in condemnation of the sliding contact, but only to point out certain results which may be expected from its use, results which I have never heard mentioned in discussions. My experience is that the slide stays on the wire better than the wheel, has much less arcing and pitting of the wire, and except in the faults mentioned is superior to the wheel. But in using it, it is well to pay special attention to fittings and points of slow speed, putting secure anchorage for the trolley wire on each side of such places, to catch breaks which may occur.

C. L. GREER.

*The Galveston-Houston (Texas) Electric Railway.

What the Committee on Welded Rail Joints Is Doing

BROOKLYN RAPID TRANSIT COMPANY
BROOKLYN, N. Y., April 11, 1922.

To the Editors:

The committee on welded rail joints has been making considerable progress in its preliminary work and it seems advisable to make a statement concerning its organization and the nature of the work so far accomplished. While the work, from its very nature, must be somewhat slow it will be realized by those who have tried to answer the questions in the four sets of data sheets recently sent out that the task of preparing them was no small one. It is quite certain that from this time forward the work will proceed faster because the committee is now in possession of enough preliminary data to permit the assignment of the various subjects requiring special research to definite sub-committees. It is now expected that a meeting of the general committee will be called early in May.

The American Electric Railway Engineering Association, through its 1921 committee on way matters, initiated the formation of a special committee on welded rail joints for the purpose of having an authoritative investigation made of the various types of welded rail joints now in commercial use. The American Bureau of Welding, as the co-ordinating agency in the general field of welding research and standardization, undertook to organize the committee.

Welding in one form or another is being widely used in making joints in street railway rails, but more or less trouble has been experienced in all types of welded joints from breakage. Very few scientific data exist as to the correct procedure to be followed in making the welds by the several processes. Several of the larger electric railway companies are spending many thousands of dollars yearly on such joints. Much of this expense is being made without a sufficient knowledge of the underlying principles involved.

A preliminary organization meeting of the committee on welded rail joints was held in June, 1921, at the office of the American Welding Bureau in New York City. At that meeting a plan of organization was prepared and the method of conducting the work outlined. A relatively large committee has since been organized, including representatives of users, consumers and the best technical experts in the field. For the purpose of directing the work during the formulative period the following were asked by the Welding Bureau to serve as an executive committee: Dr. G. K. Burgess, United States Bureau of Standards, chairman; E. M. T. Ryder, way engineer Third Avenue Railway, vice-chairman; C. A. Adams, director American Bureau of Welding;

Digitized by Google

H. M. Steward, superintendent of maintenance Boston Elevated Railway, and the writer.

It should also be noted that the Engineering Association has become a member of the American Bureau of Welding, with E. M. T. Ryder as its official representative, in order to further the important work which the bureau is conducting in its direction of the work of the welded rail joint committee.

The members of the general committee are:

F. E. Abbott, consulting inspection engineer Lackawanna Steel Company.
C. A. Adams, Harvard University, director American Bureau of Welding.
E. O. Ackerman, engineer of way Columbus Railway, Power & Light Company.
G. K. Burgess, Bureau of Standards, Washington, D. C.
Alexander Churchward, consulting engineer Wilson Welder & Metals Company.
R. C. Cram, engineer surface roadway Brooklyn Rapid Transit Company.
J. H. Deppeler, chief engineer Metal & Thermit Corporation.
H. M. Gould, City of Detroit Department of Street Railways.
H. F. A. Kleinschmidt, superintendent track welding department Lorain Steel Company.
C. F. Lederer, Metal & Thermit Corporation.
J. C. Lincoln, president Lincoln Electric Company.
E. J. McIlraith, superintendent of way Philadelphia Rapid Transit Company.
J. K. Punderford, vice-president and general manager the Connecticut Company.
E. M. T. Ryder, way engineer Third Avenue Railway System.
William Spraragen, engineering division National Research Council.
W. C. Starkey, chief engineer Ohio Brass Company.
G. Wallace Smith, engineer San Antonio Public Service Company.
H. M. Steward, superintendent of maintenance Boston Elevated Railway.
H. L. Whittemore, Bureau of Standards, Washington, D. C.
G. L. Wilson, engineer maintenance of way Minneapolis Street Railway.
W. W. Wysor, chief engineer United Railways & Electric Company of Baltimore.
F. A. Weymouth, sales metallurgist Bethlehem Steel Company.
G. C. Estill, superintendent way and structures New Orleans Railway & Light Company.
E. Vom Steeg, General Electric Company, New York.
R. H. Dalgleish, chief engineer Capital Traction Company.
H. H. George, engineer maintenance of way Public Service Railway.
John H. Hanna, vice-president Capital Traction Company, Washington, D. C.
C. S. Kimball, engineer way and structures Washington Railway & Electric Company.
E. C. Price, the Indianapolis Switch & Frog Company.
Jonathan Wolfe, assistant superintendent track and roadway Chicago Surface Lines.
H. A. Currie, the New York Central Railroad.
D. D. Ewing, Purdue University.
A. P. Way, American Railways Company.

The general scheme of conducting the work, subject to such changes as may be made at the meeting of the committee, is as follows:

1. Preparation of a bibliography and critical summary of our present knowledge, including the gathering together of all available experience in this field.

2. Consideration of the results of (1) and the laying out of specific experiments to be performed.

3. The assigning of each of these experiments or researches to an appropriate laboratory, or in the case of field experiments to one or more appropriate operating companies. These assignments would, of course, cover the men under whom these specific experiments will be conducted.

So far the work of the committee has been financed principally by the American Bureau of Welding. The committee is without funds and it is hoped that the various railway companies, together with the several manufacturing interests, will contribute toward the expense of the work, either by furnishing test specimens, conducting field tests, laboratory experiments and tests or with direct cash contributions.

R. C. CRAM,
Engineer Surface Roadway.

Motormen Need Knowledge as Well as Good Physique

PORTLAND, ORE., April 8, 1922.

To the Editors:

I read with interest the letter from the Georgia Railway & Power Company, in the April 1 issue of the ELECTRIC RAILWAY JOURNAL, concerning the selection of employees. From the viewpoint of a motorman I heartily agree with the points raised in that letter. If a man has some physical defect he is a dangerous man around any kind of railway.

But there's something else just as important as physical fitness—that is, knowledge. Knowledge as applied to the motorman comprises three things: common sense, judgment and training. Over the first two the employing company has very little control, but over the last it has, and here is where a good many fall down.

Take, for example, two interurban electric roads operating heavy trains. On the first the motormen are required to take rigid air-brake and technical examinations and the discipline is very strict as to operating rules. On the other no examination on air-brakes or other equipment is required and discipline on operating rules is very slack.

Now which of these roads will come out better in the end? I believe the first one, and it is my contention that no electric road, particularly an interurban, can afford to get along without the air-brake examination.

GEORGE W. BOOTH,
Interurban Motorman.

Is Salesmanship in Transportation Possible?

THERE are not a few railway managers who say that salesmanship on the other fellow's property may be all right and possible, but how can it apply to their properties? Salesmanship such as evidenced by the following appears to be possible anyway:

"A traveling business man reports as follows: In . . . , a couple of weeks ago, I was very agreeably impressed by a conductor, who, when I thanked him for information, replied with a smile, 'You're welcome.'

"In . . . (another town) too, they seem to have conductors who take an interest in passengers. One conductor who carried me past my destination, stopped the car, came to me and said, 'I owe you a fare. I have carried you five blocks past your stop.' He then gave me a ticket (good for 8 cents) and told me where to stand to get the return car.

"The conductor on the returning car was a salesman also. I told him where I wanted to get off, describing the location as near a certain factory I desired to reach, and he not only told me where the corner was, but, as I was alighting, told me which way to walk to reach the factory I was looking for.

"I was impressed with the fact that while these were homely acts yet they were acts which evidenced a real instinct toward salesmanship."

New Double-Truck One-Man Cars in Bangor

Six Light-Weight Cars Embodying All Safety Car Features Have Been Placed in Service by the Bangor Railway & Electric Company

BY HORACE B. BALDWIN
Master Mechanic Bangor Railway & Electric Company, Bangor, Me.

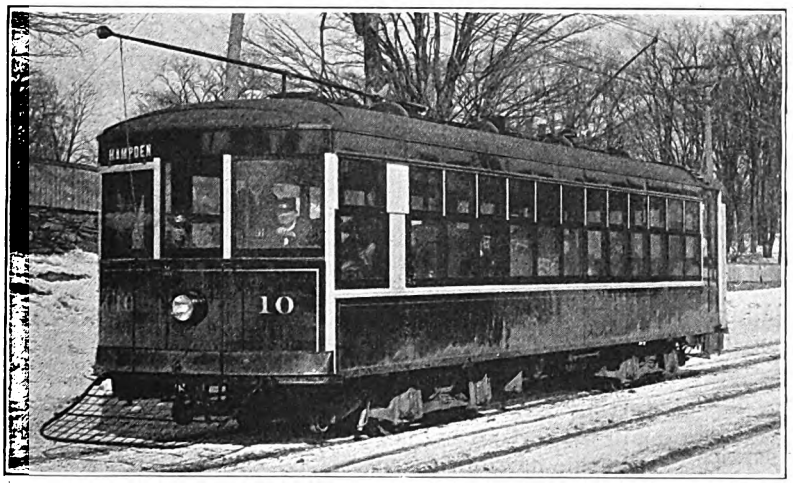
THE Bangor Railway & Electric Company has operated fifteen Birney safety cars equipped with General Electric type-258 motors since October, 1918. This operation has been very successful, but now as it is necessary to purchase new rolling stock the officials have decided to develop a light-weight double-truck car for one or two-man operation. This car can be used on either city or suburban lines, will weigh about 28,000 lb., seat fifty-two passengers and be equipped with four motors of the same type as used under the safety cars. The same general construction and all parts above the underframing will be standard with the Birney cars.

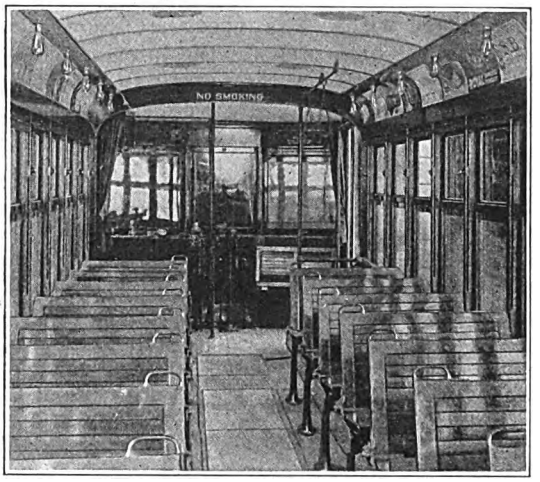
Six of these cars have been built by the Wason Manufacturing Company. The first two cars were put into service on Feb. 10, 1922, on the Bangor and Hampden line and will replace cars weighing 46,000 lb. of the semi-convertible type seating forty-four passengers, and equipped with four 40-hp. motors. During the snowstorm of Feb. 16, 1922, these cars operated very satisfactorily and we had no trouble in making the running time. The company now feels that this type of car will prove as efficient in snow as the heavier type car which it displaced. Some general dimensions of the cars are given in the accompanying table.

These cars have the general appearance of an elongated Birney safety car. The trucks are the Brill 77 E-1, specially designed for low floor, with 26-in. wheels. Other details include A.E.R.E.A—E 2 standard axles, 4 General Electric 258 Form C motors, K 35 HH control, General Electric CP 27 B air compressor, Safety Car Devices Company full safety equipment provided with whistles, Root air-operated snow scrapers, operators 14-in. foot gong, Keystone trolley catchers and Cleveland fare boxes. Two sliding curtains are provided which inclose the end of the car around the operator. Simplex No. 3 trolley bases, Golden Glow type S M 95 headlights and 22 Consolidated Car Heating Company's type 392 cross seat heaters are also used.

SOME DETAILS OF CONSTRUCTION

The body is framed for thirteen windows on each side. The side posts are 1½ in. x $\frac{7}{16}$ in. tees which run in one continuous length from side sill to side sill, and thus form the carlines. The post spacing is 28½ in. center to center except that of the extreme window opposite the door opening, which has a spacing of 38½ in. The side sills are 3 in. x 3 in. x $\frac{3}{8}$ in. angles in one continuous piece from end sill to end sill. The cross sills are 4-in. 5¼ lb. channel, and the bolsters are of the truss type with plates of 8-in. x $\frac{5}{8}$-in. and 8-in. x ¾-in. soft steel. Corner posts are pressed steel. The





EXTERIOR OF NEW LIGHTWEIGHT CAR, AND AT RIGHT VIEW SHOWING INTERIOR AND PLATFORM ARRANGEMENT

GENERAL DIMENSIONS AND WEIGHTS OF CAR

Length over bumpers	40 ft. 3 in.
Length of platform	4 ft. 9 in.
Distance between bolster centers	20 ft. 1 in.
Wheel base of truck	5 ft. 3½ in.
Width over side sheets	8 ft. 0 $\frac{7}{16}$ in.
Width over all	8 ft. 3½ in.
Height, from track to top of roof	10 ft. 1$\frac{13}{16}$ in.
Height from track to sill	2 ft. 2½ in.
Height from track to top of floor	2 ft. 8 $\frac{7}{16}$ in.
Height from track to step	16 in.
Height from step to platform	15½ in.
Width over side sheets	8 ft. 0 $\frac{3}{16}$ in.
Width over all	8 ft. 2$\frac{7}{8}$ in.
Width of door opening	2 ft. 8½ in.
Width of aisle	2 ft. 0½ in.
Side post spacing	2 ft. 4½ in.
Weight of car body with air brake and control equipment	15,110 lb.
Weight of trucks	9,100 lb.
Weight of four G. E.-258 Form C Motors	4,450 lb.

PLAN OF DOUBLE-TRUCK ONE-MAN CAR

side sheets are $\frac{3}{32}$ in. thick patent level rolled steel in four sections, the belt rail is 2½-in. x ⅜-in. steel and the letterboard No. 18 steel.

Vestibule top plates, hood rim, hood carlines, posts and ribs are of white ash. Dashers of No. 14 sheet steel in three pieces are used and platform floors are ⅞-in. hard maple. The bumper is a 3-in. 6-lb. channel.

The roof is of the plain arch type having ½-in. grooved poplar planking laid lengthwise, and covered with No. 8 cotton duck laid in white lead. The car floor is double laid with the bottom half of ⅝-in. clear spruce and the top half ¾-in. hard maple. The aisle flooring is covered with ⅛-in. corrugated rubber matting 18 in. wide, which extends to the middle of the vestibule floor. The steps are the folding type 34-in. x 10½-in. x 1¼-in. maple fitted with a 3-in. special safety treads.

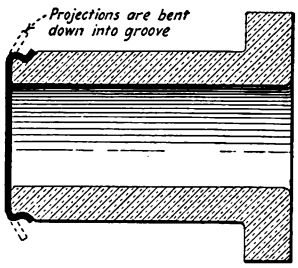
Cherry has been used for the interior finish including the moldings. No headlining was used and the carlines and roof boards are white enameled. The interior of the car body below the belt rail is lined with ¼-in. Agasote painted to match the cherry finish.

There are 22 Brill "Waylo" type reversible cross seats having cherry slats, pressed-steel ends and pedestals. The longitudinal seat at the opposite ends of the car are also of cherry.

The body panels and letterboard are painted Pullman green, the posts cream color and the sash mahogany. There are ten 23-watt lamps on each side of the car, two over each door and two in the illuminated signs, with 46-watt lamps in the headlights. The lower side windows are fitted with storm sashes for winter service and with window guards during the summer.

An Inexpensive Armature Bearing Cap

THE New York State Railways, Rochester lines, is using a cap made of tin as a substitute for the counterbored cap sometimes used as a waterproof and dustproof covering for the outside ends of armature bearings. Trouble was experienced with the usual type of cap falling off and becoming loose when used on bearings that were worn, so that proper attachment could not be secured. The tin cap which is now used is stamped out and given a slight angular turn at the edges. In order to fasten the tin cap to the bearing a tapered slot is cut in the outside near the end. The tin is then crimped into the slot so as to give a secure fastening. This is done by a tool at the same time that the bearing is turned to fit the armature shaft. When the bearings require rebabbitting again the tin cap is thrown away and a new one used.

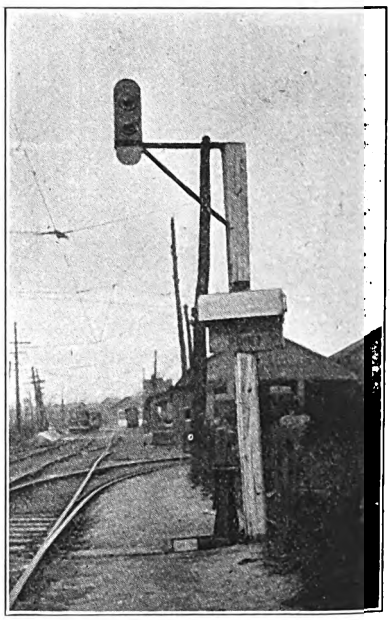


TIN DUST GUARD FOR ARMATURE BEARINGS

A method quite similar to this is used by the Kansas City (Mo.) Railway and was described in the ELECTRIC RAILWAY JOURNAL for July 29, 1916, page 197. Another method using a thin sheet steel disk which fits into the end of the armature bearing is used by the Elmira Water, Light & Railroad Company and was described in the July 7, 1917, issue, page 23.

Positive Switch Combined with Signal Provides Desired Protection

AT A POINT where the track leads off the main line of the Pennsylvania-Ohio Electric Company, to serve the Haselton car shops at Youngstown, Ohio, a simple spring switch, normally set for main-line traffic, was formerly used. There are frequent car movements out of the shop yards onto the main line and much trouble was had with split switches because the men were not careful to get the following trucks out clear of the switch before starting back on the main line. To overcome this possibility of trouble, a Bethlehem safety switch stand which locks in both positions was installed. This is a switch stand which always revolves in one direction and which snaps and locks into the new position as soon as a car forces the switch point over slightly, or as soon as pressure is applied to the switch stand handle. This has completely overcome the splitting of the switch, for there is no dependence placed on the spring to bring the switch to main-line position and the switch point is locked positively in either one position or the other. This makes it necessary for a crew bringing a car out on the main line to throw the switch by hand before starting back on the main line, yet permitting movement through the switch onto the



SAFETY SWITCH STAND AT SHOP YARDS TURNOUT EQUIPPED WITH MAIN LINE ELECTRIC SIGNAL INTERLOCK

Digitized by Google

main line without having to set it for the branch-off in advance of the car.

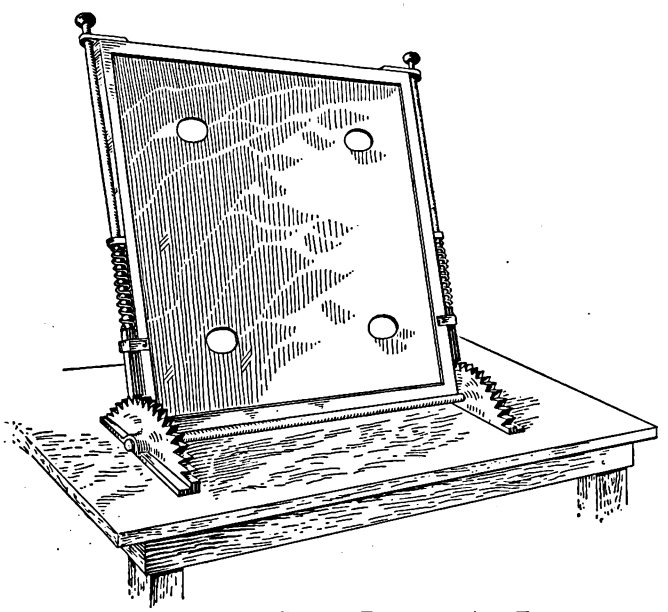
The installation of this type of switch necessitated some protection for the main line, for it will readily be seen that the switch point might be left in the wrong position for main-line traffic. This signal protection was ingeniously provided by A. B. Creelman, master mechanic. An ordinary control finger was mounted on the rod connected between the switch stand and switch point and arranged to make connection with either one of two contacts. When the switch point is in the shop track position, the connection lights a red signal, and when it is in the main line position, the connection gives the green light signal for main-line traffic. This simple contact mechanism was housed in a steel box located just in front of the switch stand, providing ample protection from the elements.

Practical Kinks from Hampton

Some of the Devices Which Have Proved of Great Assistance in Maintenance Work Include a Hydraulic Portable Pinion Puller, Tank for Cleaning Various Parts and a Rig for Testing Circuit Breakers

THE repair shops of the Newport News & Hampton Railway, Gas & Electric Company are in Hampton, Va., adjoining the main offices and carhouse of the company and are in attractive surroundings. There is plenty of room to expand and the shops have light on all sides. Perhaps it is because of these attractive surroundings that much original work in the way of improved methods of doing things has been developed at the Hampton shops.

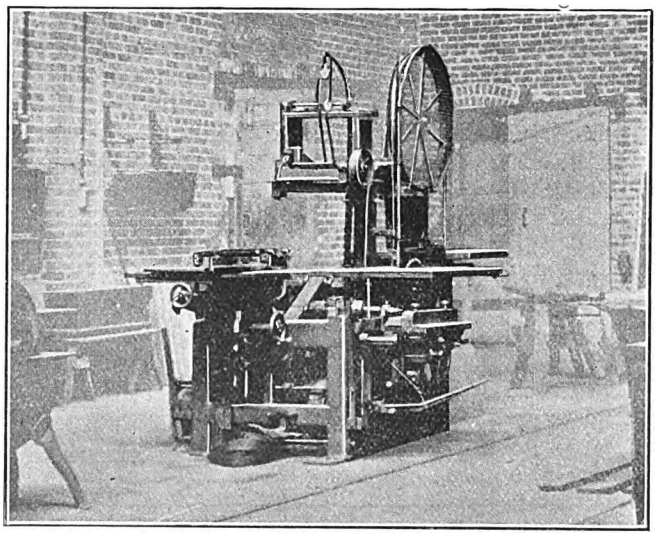
A recent visit to the shops by a representative of this paper disclosed a portable pinion puller, operated by the hydraulic process. The increase of power in this



FRAME ON WHICH CIRCUIT BREAKERS ARE TESTED. IT CAN BE SET AT ANY ANGLE

device is such that a force of 50 lb. on the handle of the puller will develop 40,000 lb. on the ram. A section and a photographic view are given.

In the operation of this puller oil or other liquid is pumped from the reservoir shown at the right in the section through the small duct and valve into the ram chamber, which is set to push against the end of the armature shaft. An extension of the frame of the ram

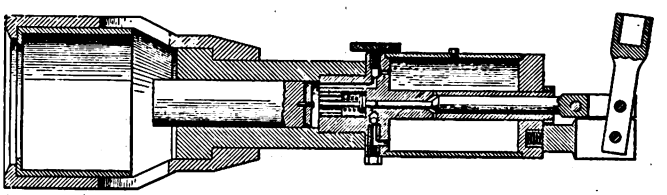


CORNER OF WOODWORKING MILL—VARIETY MACHINE AT LEFT

carries two collars with clamps to join them together, the outer collar having jaws to fit around the pinion to be removed. When the pressure is to be released, the liquid is allowed to flow back into the reservoir by the turn of a setscrew. The puller is the invention of C. W. Wood and E. C. Kelly, both connected with the railway company. It has been patented and has been placed on the market by the Electric Service Supplies Company. It has been in use in Hampton for about three years.

In operation this pinion puller clamps over the pinion, pulls in a straight line and therefore can be applied to the armature without removing the latter from the motor. It has ample power to remove pinions of any size used in electric railway service and a few strokes on the operating lever are sufficient to start the most obstinate pinion. The jaws consist of two heavy steel castings held together by quick-acting clamps with the inside face machined to take hold of new or badly worn pinions. These jaws are furnished in two sizes, which together take in the range of pinions in ordinary use. The pinion puller weighs approximately 50 lb. and is provided with a handle for convenience in carrying. As the puller is portable it can be readily carried to the pinion to be removed.

In the rear of the repair shop there is rigged up a small dipping tank for cleaning housings, bearings, brake hangers and other truck parts. The dipping tank is an old metal oil barrel heated with gas and resting on the carriage of a small chain hoist by which the parts are lowered into the tank in a wire basket. The company is using with success a cleaning mixture called "Oakite Platers' Cleaner," which has been found to clean metal parts three or four times as rapidly as



SECTION OF HYDRAULIC PINION PULLER

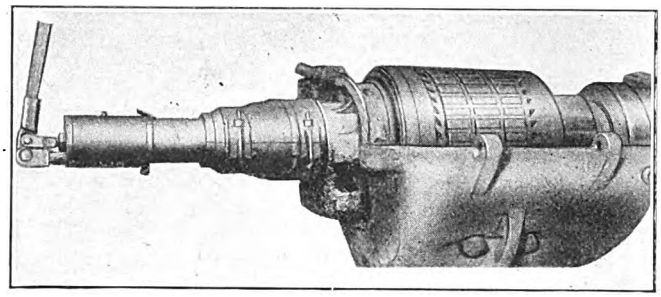
lye and to last almost indefinitely if about 10 per cent a week of the cleaner is added to the solution.

In the woodworking shop the company has recently installed a machine, illustrated in the accompanying

Digitized by Google

photograph, which performs a great many functions: It is a band saw, a trip saw, horizontal borer (used as a hollow chisel mortiser), a shaper and a joiner and has a planer attachment. It was made by the Sidney Machine Tool Company of Sidney, Ohio.

In its electrical department the company has a rig for testing circuit breakers by which it is possible to



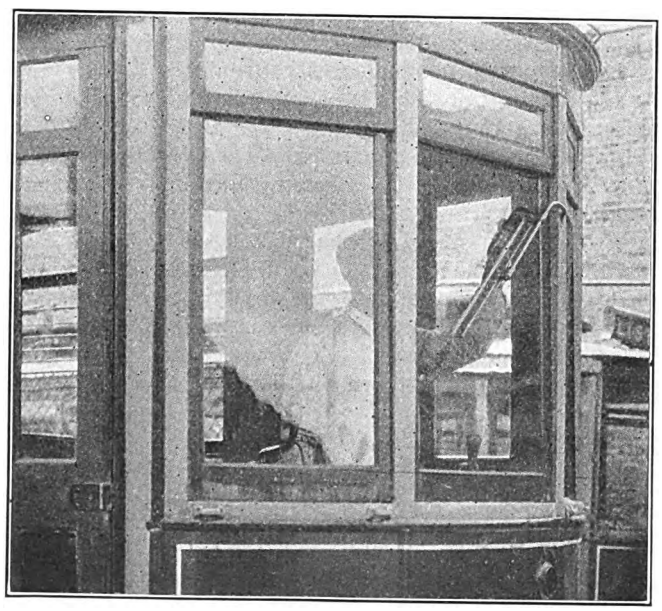
REMOVING A PINION WITH HYDRAULIC PULLER

duplicate the conditions, so far as position is concerned, of those in which the circuit breaker is placed on the car. It consists of a frame which can be set at any angle by means of a pawl and ratchet. After the circuit breaker to be tested is bolted to the frame, the latter may be set vertically or horizontally, at 45 deg. or at any other angle in which the circuit breaker is attached to the car. In this way the calibration of the breaker can be made more accurate than if the test was conducted only in the one position.

During 1921 the company got a mileage from its brake shoes of 15,500 and from its trolley wheels of 7,000. The mileage per failure last year was 5,800, or 1.11 per cent of the cars operated.

Window Wiper Speeds Up Operation

SO MUCH trouble has been experienced by motormen when the glass window pane in front of them becomes obscured in bad weather that some sort of mechanical window wiper is a necessity. The type shown in the



MECHANICAL WINDOW WIPER IN MILWAUKEE

accompanying illustration was developed in the Cold Springs shops of the Milwaukee Electric Railway & Light Company. This device permits the motorman to clean the outside glass surface without having to move from his customary place. He operates the device by turning slightly the handle that is located on the inside window framing. The wiper, which is formed of a rubber strip in a metal holder, moves radially in a vertical plane across the glass surface. This holder is attached to the outer end of an arm of roundbar steel which passes through the window framing. The device is inexpensive, simple in construction and has been installed on more than 1,000 cars of the Milwaukee system.

What's New from the Manufacturers

Cost of Thermit Welds Reduced

AS A result of an investigation by the research department of the Metal & Thermit Corporation, New York, to reduce the cost of Thermit welding, it has been found that economies amounting to 10 per cent or more can be made in regard to the amount of Thermit required to make a weld. These result from reducing

*Diameters shown above for pouring gates are mean diameters. In practice these pouring gates should be tapered, bottom diameter being approximately 1/4 in. less and top diameter approximately 1/4 in. greater than dimensions given.

the size of the collars or reinforcements of Thermit steel, also from narrowing the gap and changing the proportions of gates and risers. For instance, a weld on a 2-in. x 3-in. section, for which 40 lb. of railroad Thermit used to be recommended, now can be made with only 10 lb. of Thermit. On a 3-in. x 4-in. section, where 55 lb. was formerly recommended, 25 lb. only is needed, providing the size of collar, width of gap and size of the various gates are proportioned in accordance with the dimensions now found best.

The accompanying table gives the width of gap, width and thickness of collar, size of gates and quantity of Thermit which are now recommended in welding all sections from 3 in. x 2 in. in size up to 7 in. x 7 in.

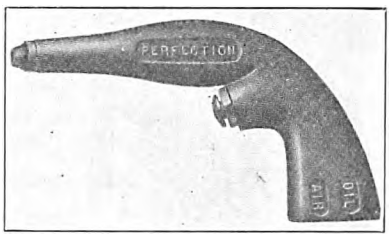
New Syphon Sprayer Gun

THE accompanying illustration shows a form of syphon sprayer for cleaning and applying liquids of various kinds by means of compressed air. This is being introduced under the trade name of "Perfection Engine and Machine Washer," by M. W. Bailey, New York, N.Y. The complete equipment includes 6 ft. of oil-proof flexible metal hose, an air hose nipple, steel nozzle, and 12-in. extension nozzle. The gun is used for applying wood preservatives, insecticides, creosote, thin paint, whitewash, etc., or wherever a syphon sprayer can be used to advantage. Several electric railways are using the gun for cleaning gear cases and truck parts.



SYPHON SPRAYER GUN

The gun is operated by pressing the valve button and a direct spray follows. The air pressure has a tendency to break the oil or solvent into a fine spray which is effective for cleaning.

Lead Alloy Bearing Metal Developed

THE United Lead Company has brought out an electrolytically produced calcium-barium-lead alloy that it is claimed possesses all the requisites of a good bearing metal. Frary metal, as it is called, is said to have good anti-frictional properties, since it retains largely the characteristics of lead in respect to plasticity. It is claimed that the property of this alloy of maintaining its hardness and strength at high temperature makes it a successful bearing metal. Its high melting point also partly accounts for this. The manufacturers say that it has the greatest hardness compatible with the necessary plasticity, but this hardness is much less than that of an axle or shaft so that in case of a dry bearing the axle is not scored, but the bearing metal itself suffers. Under working conditions the metal gradually develops fibrous structure and will take a very high polish under the revolving action of the shaft and lubricant.

The pouring and molding practice with Frary metal is not different from that of any other bearing material. Its principal physical characteristics are as follows: Tensile strength, 13,000 lb. per square inch; hardness, 20 to 30 Brinell; specific gravity, 11; melting point, 621 deg. F.; pouring temperature, 800 deg. F.; resistivity, 188 ohms per circ.mil-ft. The tensile strength of ordinary babbitt metal is about 10,600 lb. per square inch.

A number of electric railways are already using this new bearing metal on some of their cars. The accompanying table gives some results of bearings that were removed from service for inspection. All of these presented a smooth, shiny surface and none had worn down to the point requiring recasting. The remaining bearings of the various sets are still in use.

	Number of Bearings	Total Weight of Car	Maximum Speed M.P.H.	Mileage	Time in Use, Months	Loss in Weight, Ounces	Type of Bearings

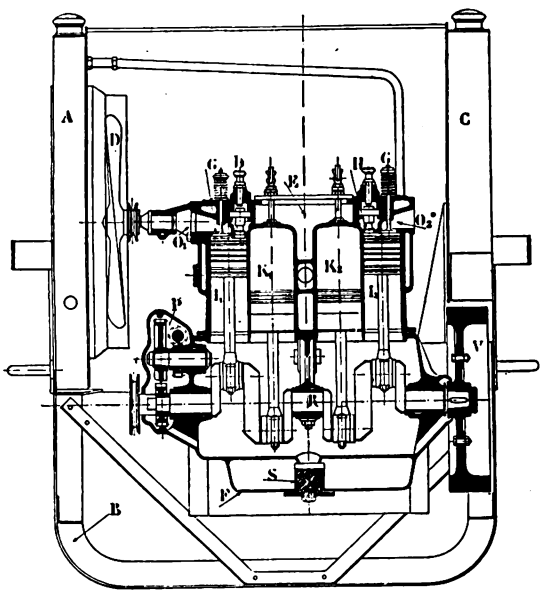
Light, Self-Contained Gasoline-Motor Air Compressor

For War Work in Drilling with Air, Etc., an Italian Automobile Manufacturer Developed a Novel Type of Compressor Which Has Now Been Made Available for General Use

DURING the war the Diatto Automobile Company of Italy was called upon to produce a light, portable air compressor with automobile gasoline-engine drive. The experience thus gained has been utilized in a peace-time machine of this type which is now being manufactured in more than one country of Europe.

The machine consists essentially of four cylinders in one block, two being engine cylinders and two compressor cylinders. Their pistons are connected to the same crankshaft, which carries a flywheel and a starting crank, and the engine valves are controlled by means of a camshaft. The engine as a whole is cooled by means of an automobile radiator and fan, and a pump is provided to circulate water around the compressor cylinders.



CROSS-SECTION OF DIATTO GASOLINE-MOTOR COMPRESSOR

A—Radiator. B—Angle-iron frame. C—Gasoline tank. D—Fan. E—Compressed-air chamber. F—Oil case. G, G—Cam-operated air inlet valves. H, H—Automatic air outlet valves. I_1, I_2—Compressor cylinders. K_1, K_2—Motor cylinders. O_1, O_2—Air inlets to compressors. P—Water circulating pump. R—Crankshaft. S—Oil strainer. V—Flywheel.

In the wartime and present designs portability has been a prime consideration, both as regards lightness and convenience of taking apart and assembling. The compact construction and the high engine speed (nor-

Digitized by Google

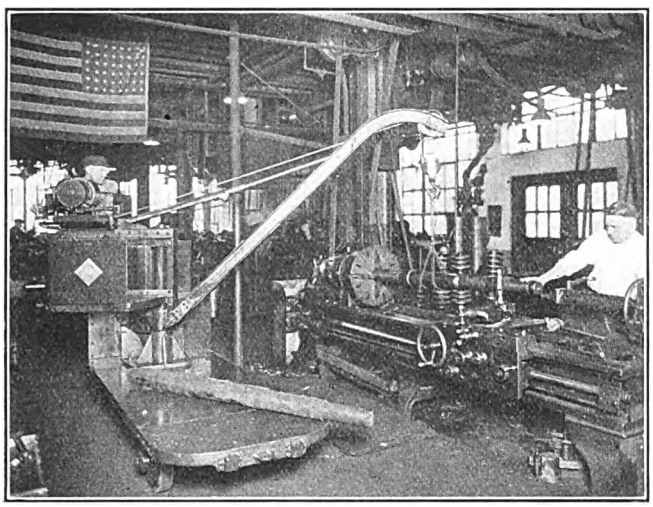
mally 1,500 r.p.m.) make lightness possible, and the general mechanical design favors the other advantages mentioned.

In the standard size described in the Jan. 28 issue of the *Génie Civil*, Paris, the motor-compressor unit weighs 794 lb., and is 4 ft. 1 in. long and high. When taken apart it consists of the motor compressor proper, weighing 254 lb., and three other pieces weighing from 175 lb. to 200 lb. each. It produces a pressure of 120 lb. per square inch, and can deliver over 50 cu.ft. of air per minute against this head. The unit can be mounted either on skids (a construction covered by the weights mentioned above) or on a wheel truck.

New Crane Truck for Shop Use

THE Elwell-Parker Electric Company, Cleveland, Ohio, has recently developed a new electric truck equipped with a revolving counterbalanced crane of unusual length. It is particularly adaptable for handling supplies in storerooms and in storage yards, as well as for serving various machine tools in railway machine shops.

The heavy vertical steel column has a long bearing in a pedestal which is bolted to the steel platform on the truck and supports a 12-ft. boom which may be racked

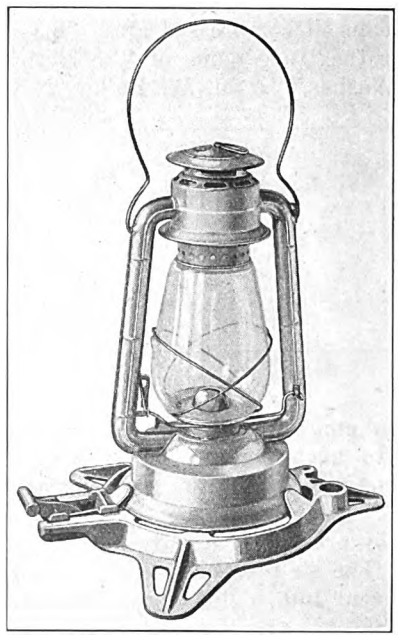


CRANE TRUCK SERVING SHOP MACHINE

in or out by the operator without leaving the driving position. The hoist is operated by a separate motor direct connected to an inclosed hoist mechanism. The controller is located on the dash in front of the crane operator. The hoist is mounted on a steel frame which houses the batteries, hoist and motors, all acting as a counterbalance. A special trip switch mounted on the front battery box stops the inward motion of the boom as set.

The crane is designed to pick up 1,000 lb. at an 8-ft. outreach, or with outriggers in position it will handle 3,000 lb. at 6-ft. outreach. The truck is equipped with 21½-in. x 3½-in. drive wheels and 15-in. x 3½-in. trailing wheels, all four of which steer. A coupler is furnished on the rear to permit using the unit for intermittent tractor service if occasion demands. Motors, differential worms, wheels and crane-pillar columns are all fitted with ball bearings. A single battery furnishes power to propel the truck as well as to operate the crane. The truck has a carrying capacity of 3,000 lb. One of the smaller though important details is the attachment or charging plug. Each battery is equipped with the receptacle end of this plug.

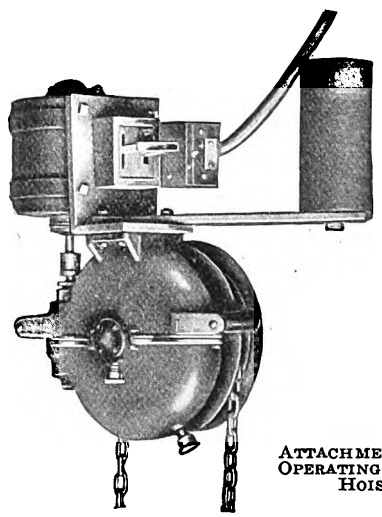
Weighting Lanterns to Keep Them in Position



THE accompanying illustration shows a lantern attached to a Drew Sentry lantern holder. This holder is built of iron and weighs 6 lb. A tension spring is provided in the base so that it will fit any size lantern. A socket is also provided for the insertion of the standard for a red flag if desired. The use of this holder prevents lanterns from being overturned by wind or storm and also prevents breaking. Wherever railway construction or repair work requires a guarding light, such a holder will be found of value.

New Electric Chain Hoist Attachment

THE accompanying illustration shows a new electrically driven attachment designed so that it can be suspended in the bight of the operating chain of a hand hoist. It has a capacity to overhaul 138 ft. of hand chain per minute and a chain pull of 130 lb. This gives



ATTACHMENT FOR OPERATING CHAIN HOIST

a load-lifting speed of approximately four times that obtainable by hand power. The machine weighs 160 lb. It is being placed on the market by the New Jersey Foundry & Machine Company, New York, N. Y.

Improved Concrete Mixing Machine

THE Foote Company, Inc., Nunda, N. Y., is bringing out a new model paving mixer, 21-E. This new model is similar to the old type 21-E, except that it is 6 in. longer in tread and frame construction and has a larger capacity drum. The new machine is rated at the same capacity as the previous type, but will have a surplus capacity.

American Association News

Recent Engineering Association Committee Gatherings

THESE days are busy ones for the Engineering Association committees. The committee on way matters met March 29 and 30, as reported in the April 8 issue, page 605. Last week's meetings are covered below:

BUILDINGS AND STRUCTURES

The committee on buildings and structures met at the offices of the Cincinnati (Ohio) Traction Company on April 3. In attendance were: Frank H. Miller, Louisville Railway, chairman; E. H. Berry, Cincinnati Traction Company; J. R. McKay, Indiana Service Corporation, and L. C. Mayer, York Railways.

On the subject of shop layouts, blue prints and data furnished by N. E. Drexler were examined and referred to the appropriate sub-committee for digest. Similarly, other assignments were referred to sub-committee chairmen, all of whom will forward their reports to Chairman Miller by May 1. The committee was also apprised of the offer of the railways bureau of the Portland Cement Association to furnish accurate information on cement and concrete. The next meeting was appointed to be held in Pitsburgh during the first week of June.

POWER DISTRIBUTION

A two-day meeting of the committee on power distribution was held in New York City April 3 and 4. Chairman M. B. Rosevear, Public Service Railway, presided and present also were the following: J. R. C. Armstrong, Brooklyn City Railroad; C. C. Beck, Ohio Brass Company; H. S. Burd, National Conduit & Cable Company; C. A. Butcher, Westinghouse Electric & Manufacturing Company; R. W. Eaton, public service engineer, Providence, R. I.; L. F. Griffith, Little Rock (Ark.) Railway & Electric Company; H. D. Hawks, Anaconda Copper Mining Company; Adrian Hughes, Jr., United Railways & Electric Company, Baltimore; F. McVittie, New York State Railways, Rochester; H. S. Murphy, Philadelphia Rapid Transit Company; G. Hall Roosevelt, General Electric Company; F. J. White, the Okonite Company.

Mr. Rosevear reported regarding the conference on overhead crossings held under the auspices of the American Engineering Standards Committee. (See ELECTRIC RAILWAY JOURNAL, March 11, 1922, pages 393 and 414.) He said that the steering committee appointed at the conference, on which the American Association has but two representatives, is considering the inclusion of Part 4 of the National Electric Safety Code. An effort will be made to increase the representation of the association.

The chairman also called attention to the importance of co-operation with other associations regarding inductive interference and the committee referred his suggestion to the executive committee.

In the same general field the following motion was passed:

> We recommend to the executive committee that by means of letters to company members, publicity in *Aera*, or any other available methods, member companies be requested to co-operate in keeping the association advised of pending or contemplated action by public authorities in establishing laws or regulations in engineering matters affecting construction or operation; also that association headquarters should be similarly advised regarding pending or contemplated establishment of recommended practices or standards by associations or others.

In regard to the activities of sub-committees which are studying subjects already referred to the A. E. S. C. it was voted that they co-operate actively with representatives of the Engineering Association on A. E. S. C. committees.

The wear and the composition of trolley wire were extensively discussed by the committee and arrangements were made to secure experimental data. The A. S. T. M. will be approached, also, with a view to agreement on a joint specification.

The 1921 report of the American Committee on Electrolysis was next discussed, and arrangements were made to co-ordinate, through Mr. Hughes, the comments of the way, power generation and power distribution committees.

Finally Mr. Roosevelt reported on the plan for a thesis on the automatic substation, to include average data secured by canvass as applied to a special case of urban transportation.

EQUIPMENT COMMITTEE

A two-day session of the equipment committee of the Engineering Association was held in New York April 5 and 6. Those present were R. H. Dalgleish, Capital Traction Company, Washington, D. C., chairman; Daniel Durie, sponsor, West Penn Railways, Pittsburgh, Pa.; W. S. Adams, the J. G. Brill Company; H. A. Benedict, Public Service Railway of New Jersey; L. J. Davis, Brooklyn City Railroad; J. L. Gould, Wilmington & Philadelphia Traction Company; Stuart Hazelwood, Midvale Steel & Ordnance Company; J. M. Hipple, Westinghouse Electric & Manufacturing Company; A. J. Miller, Association of Manufacturers of Chilled Car Wheels; M. O'Brien, United Railways of St. Louis; E. D. Priest, General Electric Company; P. V. C. See, Northern Ohio Traction & Light Company; C. W. Squier, ELECTRIC RAILWAY JOURNAL; R. W. Steigerwalt (representing C. F. W. Rys), Carnegie Steel Company; A. Scheer, Jr., Public Service Railway, and N. B. Trist, Carnegie Steel Company. The last-named two were present by invitation.

The first day was taken up with meetings of sub-committees, in formulating reports for consideration by the committee as a whole on Thursday.

The subject of wheel contours was first discussed by the full committee. R. C. Cram and V. Angerer, representing the committee on way matters, took part in this discussion. The equipment committee concluded that standard contours for chilled iron wheels should be prepared for presentation in the annual report and that certain additions and modifications should be made to the flange contours for steel wheels. As to the recommendation of the way committee for a curved contour of wheels, the equipment committee felt that it would be impracticable to turn wheels to the contour recommended and, further, that wheels as actually turned to contours now recommended differ very slightly from the new contour proposed.

The sub-committee on helical gears presented a compilation of answers received to a questionnaire on this subject. The information received by the questionnaire method was considered to be of insufficient value to warrant its continuance. To arrange for more definite and accurate information, it was suggested that the representatives of the General Electric and Westinghouse Companies submit a list of questions which will aid in bringing about a clear understanding of conditions, for consideration at the next meeting.

The subject of trolley contact devices was discussed and some replies to a questionnaire which had been sent out were examined. The replies received so far are insufficient for definite conclusions. The chairman of this committee will tabulate answers as they are received and submit recommendations with his report at the next meeting.

A very complete report was given by the chairman of the sub-committee on possible revisions of existing standards and specifications. The recommendations included allowance for press fit for solid gears, a flange of the gear seat on axles, additional wheel contours and fillets for standard axles and journal bearings. The recommendations decided on will be incorporated in the final report to be submitted at the next meeting, which will be held the latter part of May.

PURCHASES AND STORES

A meeting of the committee on purchases and stores of the Engineering Association, held in New York City, on April 7, was attended by W. H. Staub, United Railways & Electric Company, Baltimore, Md., chairman; William C. Bell, Virginia Railway & Power Company; J. F. Fleming, Capital Traction Company; C. A. Harris, Pittsburgh Railways, and W. S. Stackpole, Public Service Railway of New Jersey. The subject of proper methods of taking periodical inventories with a view to adopting standard forms was discussed in considerable detail. The

Digitized by Google

committee concluded that the inventory problem is closely associated with the work of the accounting department and that general procedure is difficult to formulate. To provide information as to various details in taking inventories, it was decided that each member of the committee should prepare a statement, accompanied by various forms used, showing in detail the methods used by his company. In addition each member will undertake to obtain similar statements from several companies in his immediate vicinity. In this way a large amount of information will be obtained for study and decision.

News of Other Associations

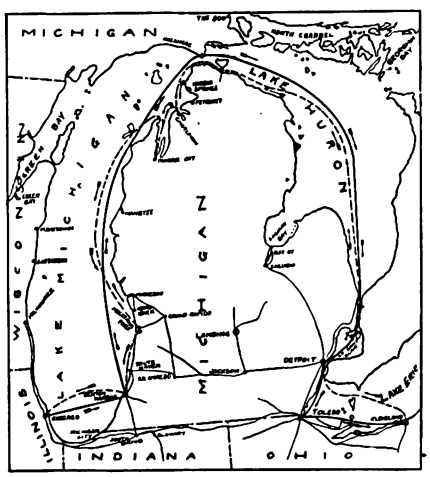
Schedule of the C.E.R.A. Cruise

SUPPLEMENTING the announcement of the six-day summer cruise of the Central Electric Railway Association, given in the issue of this paper for March 4, page 375, is the following detailed schedule, which has just been announced:

SCHEDULE FOR C.E.R.A. CRUISE—STANDARD CENTRAL TIME

	East Bound	
Lve. Chicago	Sunday	10:00 a.m. June 25
Arr. Benton Harbor	Sunday	2:00 p.m. June 25
Lve. Benton Harbor	Sunday	3:00 p.m. June 25
Arr. Mackinac	Monday	11:00 a.m. June 26
Lve. Mackinac	Monday	1:00 p.m. June 26
Arr. Detroit	Tuesday	8:00 a.m. June 27
Lve. Detroit	Tuesday	8:15 a.m. June 27
Arr. Toledo	Tuesday	1:15 p.m. June 27
Lve. Toledo	Tuesday	1:30 p.m. June 27
Arr. Cleveland	Tuesday	8:15 p.m. June 27
	West Bound	
Lve. Cleveland	Tuesday	8:30 p.m. June 27
Pass Detroit	Wednesday	6:00 a.m. June 28
Pass Port Huron	Wednesday	12:00 noon June 28
Arr. Charlevoix	Thursday	7:00 a.m. June 29
Lve. Charlevoix	Thursday	9:00 a.m. June 29
Arr. Traverse City	Thursday	12:00 am. June 29
Lve. Traverse City	Thursday	2:00 p.m. June 30
Arr. Macatawa	Friday	6:00 a.m. June 30
Lve. Macatawa	Friday	6:30 a.m. June 30
Arr. Benton Harbor	Friday	10:00 a.m. June 30
Lve. Benton Harbor	Friday	11:30 a.m. June 30
Arr. Chicago	Friday	3:30 p.m. June 30

For the accommodation of members of the party who desire to board the



ROUTE OF THE C.E.R.A. CRUISE

steamer at Chicago on Saturday evening, June 24, arrangements have been made for them to do so after 6 o'clock and have breakfast on the boat Sunday morning at a nominal price. The cost of the complete trip will be $65, and parts of the trip may be taken at appropriate rates. Members of the association may invite friends to accompany them on the trip, but these must be specially invited and tickets for them secured through the member extending the invitation.

The committee on arrangements for the cruise comprises S. D. Hutchins, chairman; John Benham, secretary; James H. Drew, Carlos Dorticos and Harry L. Brown.

Iowa Association to Meet June 23

THE annual meeting of the Iowa Electric Railway Association will be held at the Inn Hotel, Lake Okoboji, on Friday, June 23. The morning will be taken up with technical discussions and the afternoon with entertainment.

The meeting will be held immediately after the annual meeting of the Iowa Section, National Electric Light Association, and at the same place.

A. S. M. E. Addresses Are Broadcast

ON APRIL 4 messages to engineers of America, by President Dexter S. Kimball and Secretary Calvin W. Rice, of the American Society of Mechanical Engineers, were broadcast from the General Electric Station, Schenectady. The messages were heard at points as widely distant as San Francisco, Havana and the City of Mexico.

Conference on Association Waste

AT THE last meeting of the executive committee of the Society for Electrical Development a committee was appointed, consisting of C. L. Edgar of the Edison Electric Illuminating Company of Boston and E. W. Rockafellow of the Western Electric Company, to be known as its conservation committee. The purpose of this committee is to act with similar committees from other national associations in the electrical industry and avoid duplication of effort in their activities. An invitation has been extended by the society to these other organizations to appoint a similar representation to serve on a joint committee to discuss and define the most constructive and logical fields of effort for each association and effect an agreement which will eliminate overlapping and waste of resources.

It is hoped by the society that the other associations will appreciate the importance to the industry of the fulfillment of this plan and will respond to its invitation promptly and enthusiastically. It believes there is a steadily increasing tendency to criticise existing conditions, and any conservation of effort in association work will be reflected in an appreciable direct saving to the industry as a whole and increased efficiency and productivity of all co-operative effort.

Standardization of Paving Brick

THE National Paving Brick Manufacturers' Association has sent out a report of progress in the elimination of unnecessary types and sizes of paving brick. The movement is a result of the effort of Secretary Herbert Hoover to eliminate waste in industry.

On March 27 there was held in Washington the first meeting of a permanent committee, representing producers and buyers, which was appointed at a preliminary meeting held Nov. 11, 1921.

The permanent committee organized by electing E. J. Mehren, editor of *Engineering News-Record*, as chairman, and H. R. Colwell of the Department of Commerce as secretary. Organizations were represented as follows: W. A. Hull, Bureau of Standards; Will P. Blair, American Society for Testing Materials; Col. R. Keith Compton, Federated American Engineering Societies; M. B. Greenough, National Paving Brick Manufacturers' Association; L. C. Herrick, American Association of State Highway Officials; E. W. McCullough, Chamber of Commerce of the United States; V. M. Pierce, United States Bureau of Public Roads, and W. A. Durgin, chief division of simplified practice, Department of Commerce. The American Society for Municipal Improvements was represented by Colonel Compton in the absence of G. F. Fiske, the society's regular delegate.

The committee was informed that the following organizations already had formally approved the first eliminations, reducing the number of brick sizes and types from sixty-six to eleven: National Paving Brick Manufacturers' Association, American Association of State Highway Officials, American Institute of Architects, American Ceramic Society, Engineers' Club of Columbus, American Society of Civil Engineers, and the Departments of Agriculture, Commerce, the Interior, the Navy and War.

After considering new data as to total shipments of vitrified brick for 1921 the committee voted unanimously to eliminate the following sizes: Vertical fiber lug, 3 x 4 x 8½ in.; vertical fiber lug, 3½ x 4 x 8½ in.; wire-cut lug Hillside, 3½ x 4 x 8½ in.; repressed lug, 3½ x 3½ x 8½.

The following remain as the seven recognized types and sizes: Plain wire-cut, 3 x 4 x 8½ in.; plain wire-cut, 3½ x 4 x 8½ in.; repressed lug, 3½ x 4 x 8½ in.; wire-cut lug, 3½ x 4 x 8½ in.; wire-cut lug, 3½ x 3½ x 8½ in.; wire-cut lug, 3½ x 3 x 8½ in.; repressed Hillside 3½ x 4 x 8½ in.

The committee decided that with four eliminations it had proceeded as far as was desirable until there are further reactions from producers and consumers. It was therefore concluded that no further eliminations would be considered until March 23, 1923, when data on 1922 shipments will be available.

Rejects Lease Plan

Mitten Disapproves New "L" Draft—Claims Rental Was the Only Issue Not Formerly Agreed On

President Thomas E. Mitten of the Philadelphia (Pa.) Rapid Transit Company has rejected the new lease plan formulated by Mayor Moore and recently submitted to the Council and the company. In a letter to the Mayor he said that he was not willing to discard the agreement reached after months of discussion. He said that at the Councilmanic meeting held on Jan. 9, 1922, all matters with respect to the lease were settled except the rental. Inclosed with the letter was a copy of the former lease tentatively agreed on.

It seems to be the general belief that Mr. Mitten will stand by the proposal assuming all operating losses during the first year of operation and then a graduated scale of return to the city amounting to 5 per cent in the sixth year of operation and thereafter. It is reported that Mr. Mitten's letter was entirely unsatisfactory to the Mayor.

The latest proposal by Mayor Moore on the operation of the Frankford Elevated line by the Philadelphia (Pa.) Rapid Transit Company was forwarded to the City Council on April 6, thus renewing the interrupted negotiations for an agreement on the management of this line. As was commented on editorially in the *Public Ledger* there is encouragement in this communication in that the Mayor does not stress the independent operation of the line but rather the importance of an "agreement with the Philadelphia Rapid Transit Company and the unification of the service under one management."

The outstanding feature of the new draft is the change in the rental clause. The original proposal contained a clause for a 5 per cent rental from the beginning of operation. The Mayor now recommends a sliding scale of rental commencing at 2 per cent on Jan. 1 next and increasing by increments of 1 per cent per annum until the maximum of 6 per cent is reached in 1927. A 1 per cent payment plan had been suggested by T. E. Mitten, president of the Philadelphia property. The proposed agreement is to be permanent or until 1957, when the 1907 agreement also will expire.

CHANGE IN RENTAL SUGGESTED

An important feature of the Mayor's letter is the fact that the city should share in the company's profits above the 6 per cent mark, remarking that the same treatment that is promised to stockholders should also be extended to the city. The new arrangement includes the establishment of a depreciation fund to take care of replacements necessitated by the wear on the city-owned cars to be used on the northeast line. The Mayor likens his draft to the one of March 31, 1921, in that no attempt is made to stipulate the rate of fare. In conclusion the letter said:

> If this matter can be closed at an early date it is proposed immediately to bring to the attention of your body the question of extension now agitating certain sections of the city where car riders are asking for increased service. These extensions include an arm of the Frankford L to provide high-speed service for the northern district of the city; also the Roosevelt Boulevard and cross-town lines, all of which are contingent upon the operation of the Frankford L.

In the proposal submitted by the Mayor to the Philadelphia Rapid Transit Company Oct. 1 has been set as the date when the Philadelphia Rapid Transit Company will begin operation of the Frankford line. The line will be given rent free until Jan. 1, 1923, when the new provisions of the lease will go into effect.

Railway Opposes Council's Request

The International Railway, Buffalo, N. Y., through its general counsel, C. J. Joyce of Philadelphia, attorney for the Mitten Management, Inc., has refused to allow the municipal authorities of Buffalo to make an examination of its books in connection with the pending rate case before the Public Service Commission. The City Council had asked Herbert G. Tulley, president of the International, to allow Milo R. Maltbie, the city's expert, to examine certain records for data not contained in the report to the state utilities board.

During a conference with the municipal authorities over the fare question, Mr. Joyce said the railroad had nothing to hide from its stockholders or the people of Buffalo, but he opposed the principle of opening the company's records to outside interests. The city contends that the report to the Public Service Commission does not give enough detail and the Council believes it has the right to examine the books of any public utility.

Relief Offered Injured Railway Employees

A new type of public service is being rendered by the Reconstruction Hospital, New York, N. Y., a hospital dedicated to the reconstruction of men and women injured anywhere in America in the industries. As a direct result of the worldwide experiments in rehabilitation of men injured in war, America has now a hospital the sole aim of which is to care for industrial diseases and accidents and the restoration of industrial casualties to active useful life. This hospital, with the breaking ground on April 2 for its new eleven story addition at 100th Street and Central Park West, now enters upon a national career, prepared to offer a unique service to industry. The specific purpose is to provide treatment which will not only restore the health of the injured workman but will give him back his full earning capacity as well. Electric railway employees injured in the performance of their duties may secure the necessary treatment at this hospital.

"Truth," a New A. E. R. A. Publication

A copy of *Truth* was sent under date of April 12 to members of the American Electric Railway Association. *Truth* is a clip sheet full of constructive facts about the electric railway industry, which the Committee on Co-operation of Manufacturers has had prepared for members of the association. A copy of *Truth* will be mailed to members each month, from the Advertising Section of the American Electric Railway Association.

The hope of the committee is that the member companies will get over to their employees the facts contained in this sheet. Companies that have a company publication are urged to reprint the material in *Truth*. Companies that put stuffers in pay envelopes are urged to use some of the material in them. Companies that have no printed medium are urged to use the material in talks with the men, and are being asked to put some of the facts in sales letters, or use the material in any other of the many ways which suggest themselves. The first issue of *Truth* appears as a single sheet, 8½ in. wide by 14 in. high. The foreword says:

> Issued by the committee on publicity of the American Electric Railway Association, 8 West Fortieth Street, New York, for the use of persons and organizations co-operating in giving currency to facts about electric railway conditions. Material contained herein may be used as original matter—no credit being required—in house organs, company leaflets, newspaper interviews or releases, speeches, advertisements or in any other way desired. The association, however, vouches for the accuracy of all original statements contained, and it may be given as the source of information whenever preferable to do so.

Efforts Made to Place Franchise Rights with Commission

It has been announced that the California Real Estate Association plans to place in circulation a petition for the purpose of an initiative measure to amend the State Constitution to give the State Railroad Commission the power to grant franchises to public utilities operating within or without municipalities. A tentative draft of the proposed amendment was prepared at the request of Chris R. Jones, regional director of the Real Estate Association, at the State Capitol.

In this connection, W. V. Hill, manager of the California Electric Railways Association, has issued a statement claiming that the present franchise obligations of electric railways in California are burdensome to the extent of being the cause of financial distress for the carriers. Further franchises will be assumed only under much different conditions than those assumed by the railways in the past. He said that in the larger cities of the State, with the exception of Oakland, franchises were limited to from twenty to twenty-five years and little business sagacity was required to see the difficulty of financing a property with bonds whose life extended beyond the franchise period.

Reduces Wages Five Cents an Hour

The Manchester Traction, Light & Power Company, Manchester, N. H., has announced a wage reduction of 5 cents an hour affecting employees of the Manchester Street Railway, the Manchester & Derry Street Railway and the Manchester & Nashua Street Railway. The new rates, effective April 1, 1922, to April 1, 1923, in cents per hour are as follows:

Conductors and motormen	
First three months	45
Next nine months	50
Thereafter	55
The rate established for overtime is one-fifth of the regular rate, and the morning reporting time rate is reduced 60 per cent.	
Snow plow work	
Motormen	70
Sixteen trackmen	60
Outside men	company to make price.
Carhouse men	
Day foreman	$46.15 per week
Night foreman	67½
Night repair man	52
Bolt man	56
Air brake and miscellaneous men	66
Painter—foreman	70
Blacksmiths, pitmen and painters	59
Armature winders	73
Head inspector of equipment	62
Other inspectors of equipment	59
Helpers, car sweepers and cleaners	51
Trackmen	
Track foreman	$45.56 per week
Seven permanent trackmen	53½
Nine permanent trackmen	50
Linemen	
Foreman	74½
Lineman	66
Lineman	60

The rates of wages for motormen and conductors in effect from April 1, 1920, to April 1, 1921, were 50, 55 and 60 cents per hour. From April 1, 1921, to July 15, 1921, this agreement was modified so that a reduction of 5 cents per hour was in effect during that period. After July 15, 1921, the schedule April 1, 1920, to April 1, 1921, was in force.

Service to Be Resumed in Augusta

Service will probably be resumed in Augusta by the Augusta-Aiken Railway & Electric Company on Saturday, April 15. News to this effect was contained in a telegram received from Augusta on April 14 in which the information was conveyed that the City Council on the night of April 12 had passed resolutions regulating the jitneys. As Friday was a holiday in financial circles in New York it was impossible to secure any further details from the J. G. White Management Corporation before going to press. That the situation in Augusta was fast heading toward an adjustment is indicated in the following account of some of the recent moves made there in connection with the controversy.

Mayor Julian M. Smith was requested by members of the Council of Augusta, Ga., to call a special meeting of that body for April 12 to discuss and act on the jitney and electric railway controversy.

Charles S. Banghart, vice-president and general manager of the company, had previously indicated to the Council that the executive committee of the company had declined to authorize him to put cars in operation again on the terms which had been suggested by the committee of the Council. The attitude of the executive committee was that it had been demonstrated by experiment that the company could not make actual operating expenses on the terms suggested by the committee.

Mr. Banghart indicated that if the city could see its way clear to remove the jitneys two blocks from car lines, instead of one, and prevent them from taking on and discharging passengers within two blocks of any trolley line, his company would re-start the cars, adopting the schedules mentioned in the committees' proposal and put on a 7-cent, instead of an 8-cent token fare for the general public, a 5-cent fare for school children and teachers. There would, however, have to be a 10-cent fare for the casual rider who refuses to buy 7-cent tokens. Mr. Banghart said:

> If the city should not find itself able to remove the jitneys two blocks as above set forth, but only one block as stated in the committee's proposal then the company in its excessive desire to meet the wishes of the public for restoring car service in the city will consent to this modification on condition that jitneys are not to cross Broad Street and that if after thirty days' trial the jitney competition still materially cuts into the railway's legitimate revenue, the city will then consent to remove them two blocks and in default the company is to be free to exercise its legal right again to stop the cars.

Millions for Improvements

Anticipating formal ratification at its next meeting by the Commission Council of New Orleans, La., of the agreement reached by the Council and the representatives of the security holders of the New Orleans Railway & Light Company, Commissioner Maloney on April 11, addressed himself to Receiver J. D. O'Keefe, on the subject of the immediate purchase of 100 new cars. The estimated expense of the equipment is said to be $1,000,000. The cars may now be purchased as under the agreement now reached several million dollars will be provided for improvements, which will include rehabilitation of the electric department by providing more power. The company's equipment at present consists of 550 cars, of which number only 475 cars are in operation.

Service-at-Cost Measure Signed

Governor Miller of New York has signed the Dick bill amending the public service commission law. The new measure defines service-at-cost contracts and authorizes municipal corporations with less than 1,000,000 population and street surface railroad corporations to enter into these contracts after public service commission approval.

A service-at-cost contract is defined to be an agreement between a municipal corporation and a street surface railroad corporation, providing generally for operation of a street surface railroad, wholly or partly in the limits of the municipal corporation, with a rate of fare directly or indirectly dependent on the excess of revenues after deduction of expenses and charges. All municipal corporations having less than 1,000,000 population and street railroad corporations now existing or which shall hereafter exist, may enter into such a contract. A ten days' notice to the Public Service Commission is required for its approval, which may be given to any such contract entered into after July 1, 1920.

No provision of any law, general or special, unless the contrary is specifically stated in such a law subsequently in effect, shall be deemed to interfere with the service-at-cost contract authorized by the new law.

Car Shops Burn in Oshkosh

The Eastern Wisconsin Electric Company, Oshkosh, Wis., suffered the loss by fire of the principal part of its shop and storehouse on April 9. One of the new safety cars, one interurban car and one older double-track city car, all shop records and much valuable equipment and supplies were destroyed. The disaster came on the heels of one of the worst sleet storms in the history of Wisconsin, and was quite a blow to the company.

Despite the handicap which the fire imposed on the company the local city service and all interurban lines operated 100 per cent during the blaze and service has been maintained at that standard since then by the unceasing efforts of the manager and his staff.

The damage to the equipment is estimated at $40,000. The stock room contained approximately $40,000 worth of stock. It was believed at first that this stock had been entirely destroyed and that the loss would total $100,000. Investigation made the morning after the fire indicated that this loss was not nearly so great as had appeared at first. The damage to the building is estimated at $25,000 to $30,000.

G-E to Equip Fifteen Trolley Buses

The General Electric Company has received an order for the electrical equipment for 15 new trackless trolley buses, eight of which will be operated by the City of New York on an extension to its system in Staten Island between Richmond and Tottenville. The remaining seven will be put on a new line that is to be built on City Island. The order was placed through the Trackless Transportation Corporation, New York, N. Y.

Decision of the city to increase its fleet of trolley buses is the result of the thorough commercial success attending the operation of the first buses which have been operating out of Meiers Corner, Staten Island, since Oct. 8, 1921. When these 15 buses are added to the system, New York City will have a total of 22 trolley buses in operation, all of which are equipped with General Electric motors and control and current collectors.

The automatic substation equipment will be furnished by the Westinghouse Electric & Manufacturing Company, according to report.

Financial and Corporate

Toledo Property Reports

Deficit Under Service at Cost—Lower Fares Depend Upon Action to Regulate Buses

Operations of the Community Traction Company, Toledo, Ohio, for the eleven months of 1921 under the service-at-cost ordinance put into effect on Feb. 1, showed a deficit of $325,036 as reflected in the stabilizing fund. The annual report has been published by the Toledo *City Journal*, the official city publication. The passenger revenue amounted to $2,960,966. The total gross income was $3,148,889. Operating expenses totalled $2,021,870.

Commissioner Wilfred E. Cann, however, points out in his report that the car riders have been saved $327,325 by reason of the lower fares which the new plan of operation put into effect. For the first six months the fares were cut 1 cent and transfers have been cut from 2 cents to 1 cent ever since the ordinance has been in force.

From the gross revenues of the operations for 1921 there was placed in the city purchase fund $194,792, of which $149,000 was used on Feb. 1, 1922, to purchase 6 per cent bonds of the Community Traction Company. These, together with what may be purchased in July, will make the city's income from bonds alone about $12,000 a month. The city fund at the present time amounts to nearly a quarter of a million dollars. During 1921 there was spent on maintenance of tracks, equipment and trolley wire the sum of $560,628.

At the end of the year there were cash balances in the depreciation fund of $5,789, in the reserve for injuries and damages of $11,291, and in the reserve for taxes of $109,913, or a total of $126,993.

The revenue per car-mile increased from 38.045 cents in July to 46.354 in December. The high point in cost of operation per car-mile was in February with 42.863 cents, which consistently declined to 30.498 cents in December.

During February there was carried an average of 8.81 revenue passengers per car-mile. This ratio declined till a low point was reached in August with 7.01 passengers per car-mile. The December loading was at the rate of 7.95 passengers per car-mile. With a yearly average of 8.5 passengers a car-mile, Commissioner Cann declares the lines would be on a good financial basis.

An increase of less than 600,000 passengers a month will make for successful operation. Last March had 700,000 more riders than there were in December, so the possibility of wiping out the deficit appears very good.

In the report the commissioner tells the Council that it must take more drastic action to regulate the buses if the concerted effort of all to bring lower fares is to be successful.

A comprehensive grade separation program is urged as a means of working out further economies in street railway operation. The commissioner also tells the Council that there are forty locations in Toledo where the street railways cross steam railroad tracks and 112 crossing diamonds to maintain. He says further rerouting plans will be developed during the year.

The record of the claims department was notable during 1921. For the eleven months 2.573 per cent of the gross revenue was set aside in the reserve for injuries and damages. This amounted to $79,905. Actual settlements and operation of the department took only $68,614, equivalent to only 2.214 per cent of the gross revenue. Better results may be attained by more careful regulation of traffic on the streets, according to the commissioner.

Of the 2,295 accidents reported by crews operating street cars, 1,323 covered collisions with automobiles, and of the 425 cases settled 143 representing collisions between cars and autos were disposed of by payment to claimants of $9,189.

"The year 1921 ushered in a new era in local transportation in Toledo," said Mr. Cann. "Control of street railway service is now vested in the city, where it properly belongs, and your local transportation system is today, to all practical intents and purposes, solely that of the people of Toledo."

Salt Lake City Property Reports

A net revenue of $84,815 was earned by the Bamberger Electric Railroad, Salt Lake City, Utah, during 1921, according to figures presented by the company in its annual report, which has just been filed with the State Public Utilities Commission. The operating income of the road was $33,654, with a gross income amounting to $48,558. From this figure the railroad claims deductions for interest, taxes, rents, etc., of $82,213, making a deficit of $33,655 transferred to profit and loss during the year. The principal source of revenue for the railroad was the passenger service, which yielded $471,719, yet this was $79,067 lower than the 1920 passenger revenue.

The railroad claims investments to a total of $3,910,442, this being an increase over the preceding year of $102,448. Par value of the capital stock Dec. 31, 1921, aggregated $1,500,000. The average investment per mile of road was $102,676, the total investment in road and equipment being $3,690,188. The book value of investment in the Lagoon resort and the Salt Lake Terminal Company is given by the company at $147,652.

To Take New York Depositions

Minneapolis Valuation Hinges on City's Access to Books—Hearing Set for April 25

Neil M. Cronin, city attorney of Minneapolis, Minn., is in New York to take depositions of four witnesses in the mandamus action against the Twin City Rapid Transit Company and allied corporations to get access to minute books and other records. Depositions were begun on April 11 before William Bradford, notary public. The city desires to ascertain the true valuation of the company's property.

The writ was signed on Feb. 9 by Judge W. W. Bardwell of the District Court, the city seeking to compel the traction officials to produce the books to aid in the appraisal being made by Delos F. Wilcox for the city in its rate litigation. The City Council had directed the company to give Dr. Wilcox access to the books, which the company is alleged to have refused to do, with the exception of the minute books of the Minneapolis Street Railway and other associated companies. Delay of twenty days to March 2 was granted on motion of the company, its plea being it would be necessary to go to New Jersey to get the books. Secretary A. M. Robertson said the Twin City Rapid Transit Company is merely a holding company and that its books have no records of the business activities of the Minneapolis company. The writ was dismissed on March 13 on motion of the city attorney and a new action begun before Judge H. D. Dickinson, who granted a writ directed against the Twin City Rapid Transit Company and the St. Paul City Railway, omitted in the first order. The New Jersey company's answer stated that that company has not been the fiscal agent of either Twin City company since 1907 and that the Transit Supply Company is the fiscal agent and its books are open. In reply to an allegation of the city that the Twin City Rapid Transit Company had arbitrarily caused substantial amounts to be paid the St. Paul City Railway on which the railway is not required to pay interest to the Minneapolis Street Railway, from which the amounts are taken, it denies that the St. Paul and Minneapolis companies are caused to assume a joint fund obligation. The two local companies executed a joint mortgage securing $10,000,000 of bonds guaranteed by the Twin City Rapid Transit Company.

Upon filing of this answer of the company on April 2 the hearing was set for April 25. This being the date set for the valuation hearing of the St. Paul City Railway before the Railroad and Warehouse Commission, St. Paul considers advancing the date so as to have a joint hearing with Minneapolis, giving the latter city no advantage over St. Paul in its proceedings to determine the basis for a true fare decision by the state commission.

Surplus of $990,099

Virginia Property Cuts Operating Expenses—Cash Conserved for Improvements—Traffic Decreases

After deducting all charges the Virginia Railway & Power Company, Richmond, Va., realized a surplus of $990,099 for the year ended Dec. 31, 1921. Adding the surplus at the end of 1920 the total surplus as of Dec. 31, 1921, is $2,291,175. From this amount a deduction of $507,738 was made for dividends on preferred stock and an accumulated surplus remains on Dec. 31, 1921 of $1,783,437.

Gross earnings for the year amounted to $10,173,335, an increase of $179,759 over the year 1920. Operating expenses decreased from $7,080,070 to $7,067,662.

The annual report of the company shows that the property of all departments is in good physical condition. Improvement in operation is also seen from the fact that expenditures for maintenance and way and equipment amounted to $1,060,593, against $1,179,781 in 1920. In addition to the regular charges for maintenance of way and equipment an amount of $610,400, equal to 6 per cent of the gross earnings for the fiscal year, was included in the operating expenses and credited to reserve for depreciation, thus continuing the policy followed by the company during the last ten years. The balance to the credit of reserve for depreciation on Dec. 31, 1921, was $1,625,811.

The total number of passengers carried during 1921 was 105,192,532, against 113,615,675 in 1920.

In his report President Wheelwright said that on account of the necessity of making extensions and improvements in both railway and light and power departments the board of directors considered it necessary to continue the conservation of cash resources of the company so far as possible and for that reason no cash dividends were declared on the stock of the company during the year. He said further that the board of directors in its desire to deal fairly with the holders of its non-cumulative preferred stock declared a dividend of 6 per cent on preferred stock, payable in preferred stock for the year 1920, and a similar dividend for the year 1921.

Greater Volume of Business Under Negotiation

The annual report of J. G. White Companies, New York, N. Y. for the year ended Dec. 31, 1921, shows a deficit of $126,484, against a surplus in 1920 of $313,016. The total assets and liabilities as of Dec. 31, 1921, are $6,698,527.

The report states that as predicted in the previous annual report the business of the Engineering Corporation was adversely affected by the general business depression. It goes on to say further that since the first of the year a substantial amount of satisfactory business has been secured. Further improvement in this respect is anticipated as more new business is under negotiation than at any previous time for several years.

Will Vote on $300,000 Bond Issue

St. Petersburg (Fla.), will vote May 13 on a $300,000 bond issue to provide an electric plant to run its municipal electric railway and furnish power for waterworks, gas plant and street lighting.

The city attorney has been ordered to draw the ordinance and the commission will pass it and immediately call the election.

C. T. Baker, a consulting engineer, has submitted a comprehensive report covering the cost of installing and operating an electric power plant in St. Petersburg, using Diesel type engines. He suggests that the plant be located on Second Avenue south about Eighteenth Street, on the Seaboard Airline Railway. He estimates that the plant complete will cost $301,000 and that the cost of the first year's operation, including fixed charges, will be approximately $61,350, while Director of Utilities R. E. Ludwig estimates that under the latest proposed contract with the St. Petersburg Lighting Company the cost for power the first year would be $65,000 and the city would be obligated to pay for certain improvements at the privately owned plant. The estimated cost of the city plant the second year is $68,470, while Mr. Ludwig estimates the cost to the city for that same year, under a contract with the lighting company, at $112,340.

Meeting Held—Will Absorb West End Property

The Boston (Mass.) Elevated Railway's stockholders held their annual meeting on April 3 and re-elected the old board of directors. They did not fill the vacancy on the board caused by the recent death of General William A. Bancroft.

On June 10 the Boston Elevated will absorb the West End Street Railway, which it has been holding under a lease, and the West End company will pass out of existence. The West End preferred stock will be exchanged for Elevated first preferred; the West End common will become Elevated second preferred stock and the Elevated preferred stock will become Elevated third preferred rates of dividend to remain as they are today on the respective stocks.

The West End Street Railway is the owner of the surface lines in the Elevated system. When it passes out of existence some of its directors and officers may be taken into the Boston Elevated directorate, as under the law the seven directors who were elected by the elevated stockholders on April 3 have a right to increase their number to fourteen.

Protective Committee Makes Favorable Report

In the letter sent to the noteholders by the protective committee it was said that the net earnings of the Brooklyn Rapid Transit Company subway and elevated lines for the eight months ended Feb. 28, 1922, were $2,378,686. This sum is in excess of operating expenses and taxes, interest on the $22,967,000 of underlying bonds resting on the elevated lines and on the receiver's certificates and other prior charges. The showing thus made is at the rate of about 5.9 per cent per annum upon the outstanding notes and bonds of these issues, and if allowance be made for $298,606 of interest on receiver's certificates reported to be chargeable to construction this rate would be increased to about 6.7 per cent.

The letter states further that the receiver of the subway and elevated lines has been able to pay off $2,000,000 of the $18,000,000 of receiver's certificates that were originally issued, and an additional $2,500,000 have been purchased by the receiver of the Brooklyn Rapid Transit Company out of funds in his hands. In part the letter says:

> Your committee will continue to press for the necessary adjudication and to keep in touch with the further proceedings of the Transit Commission and with the operation and earnings of the properties, to the end that unless the Transit Commission should offer some basis for participation in a comprehensive plan of reorganization which the security holders can afford to accept, the committee may be in a position to proceed with the formulation of a plan of reorganization as soon as the necessary legal questions have been finally adjudicated and conditions are opportune for the raising of the money necessary to provide for the payment of the receiver's certificates and other cash requirements.

It is said that meetings have been held for some time with the object in view of effecting a reorganization of the property. Officials of the company stated that within a few months an application to lift the receivership might be made.

Judge Julius M. Mayer in the Federal District Court has signed an order directing the receiver, Lindley M. Garrison, to pay on April 15 the semi-annual coupon interest due since July 1, 1919, on the first consolidated mortgage 4 per cent gold bonds of the Coney Island & Brooklyn Railroad Company and on the 5 per cent consolidated first mortgage bonds of the Brooklyn City & Newton Railroad. The interest is to be paid at 6 per cent from the time that payment was originally due.

Seeks Bond Extension.—The Worcester Consolidated Street Railway, Worcester, Mass., has filed a petition with the Department of Public Utilities asking approval of an extension of $500,000 of 4½ per cent gold coupon bonds for five years from Sept. 1, 1922. These bonds are part of an issue of $1,000,000, $500,000 of which are dated Sept. 1, 1902, and the remainder dated Sept. 1, 1905. The new bonds, if approved by the commission, will bear interest at 7 per cent.

Application May Be Withdrawn

Threatened Abandonment of the Springfield and Washington Line May Result in Complete Reorganization

Although application has been filed with the Ohio Public Utilities Commission for abandonment of service on the Springfield & Washington Railway, operating between Springfield and South Charleston, Ohio, with hearing set for April 14, developments indicate that the application will be withdrawn and service continued under a complete reorganization program. G. D. Baker of Springfield, son of G. W. Baker, the original owner of the line, has purchased the interests of the other heirs and announces that service will continue with a number of changes to be inaugurated. Under the reorganization now being arranged, Mr. Baker becomes president and treasurer; W. W. Keifer, Springfield, vice-president; E. W. Gangwish, Washington Courthouse, secretary; James McDaniel, Washington Courthouse, general manager, and C. J. Baugh, South Charleston, assistant general manager.

One of the first efforts of the reorganized company will be to regain the extensive freight business lost when shippers began delivering their products by motor truck. Mr. Baker declares that under a plan he has in mind he can deliver these shipments quicker and cheaper than the manufacturers can with their own trucks where they have less than a full truck load for transportation both ways. He is at present engaged in perfecting this plan and says he will make a public announcement of it within the near future.

Since the sale of the road an arrangement has been made with the Flag motor-bus line of Washington Courthouse, which has been operating buses between Springfield and Washington Courthouse and other points, whereby the bus line will operate between South Charleston, discontinuning service to Springfield. Transfers between the bus line and the traction line will be issued for persons desiring to make the through trip. Package freight between the two points will be handled in this manner also.

Mr. Baker has received the assurances of the Springfield and South Charleston Chambers of Commerce that these bodies will offer co-operation in every way possible, and already a campaign has been started for the members to make their freight shipments via the traction line. Passenger service will stop at 9 p.m. daily and freight only will be handled between that hour and 5 a.m. It is planned to make a special rate for all night freight shipments.

One of the problems which has faced the road was that of taking care of its paving assessments. In this respect, however, the Springfield Chamber of Commerce has offered its aid and an effort will be made to have the traction line exempted from any paving assessments now due or which may be levied in the future. Should this move be found impossible, the business men may propose an extra levy which it is believed will carry, inasmuch as all persons living along the line are anxious to make some sacrifice in order to keep the road in operation.

Power for the road is now being obtained from Dayton, but it is understood that the Springfield Light, Heat & Power Company will provide a contract at a much lower figure than is now being given. Attempts will also be made to operate "feeder" bus lines along the way, running from cities or towns not connected with the traction line, to a point where contact can be made with the line and transfers made. A test bus will be operated at various points to determine how practical this proposal will be.

Other traction lines in the vicinity are watching the Springfield & Washington Railway developments with keen interest inasmuch as this was one of the first roads to feel the real effect of motor bus and truck competition. It is felt that should a practical solution of the road's problems be reached so as to make it a financial success, the ideas will be worth application to other lines.

Financial News Notes

Carhouse Sale Postponed.—The sale of the carhouse property of the New York Railways at Thirty-second Street and Lexington Avenue has been adjourned until April 20. It was originally scheduled for March 30 on the steps of the New York County Court House.

Applies for Stock Sale Permission.—The Chicago, Aurora & Elgin Railroad has applied to the Illinois Commerce Commission for permission to issue $11,000,000 common stock for the purpose of acquiring the properties of the Aurora, Elgin & Chicago Railroad, Aurora, Ill.

Year's Surplus Is $113,550.—The Michigan Gas & Electric Company, Ishpeming, Mich., reports for the year ended Dec. 31, 1921, gross earnings of $553,957; net earnings of $119.055; surplus after interest and other charges of $19,758, leaving a total surplus on Dec. 31 last. of $113,550, as compared with $118.863 on Dec. 31, 1920.

Will Offer Securities.—The Wisconsin Railroad Commission has granted permission to the Wisconsin Gas & Electric Company, Milwaukee, Wis., to issue $750,000 in securities to pay for additions to power house equipment and for extensions to its lines. This company sells gas and electricity in southern and eastern Wisconsin.

Surplus of $487,521.—For the nine months period ended Dec. 31 1921, the Market Street Railway, San Francisco, Cal., realized a surplus after interest charges, etc., of $487,521. The total revenues were $7,089,944 and the gross income was $1,439,466. Total assets and liabilities as of Dec. 31 amounted to $48,696,411.

New Issue Announced.—Harris, Forbes & Company, New York, N. Y., are offering $3,000,000 of the New York State Railways first consolidated mortgage gold bonds. The bonds are dated Nov. 1, 1912, and are due Nov. 1, 1962. They are 4½ per cent securities with 2 per cent extra coupons, thus bearing 6½ per cent interest. The offering price was 95 and interest, to yield about 6⅞ per cent.

Receiver Will Purchase Coupons.—The Nassau Electric Railroad of the Brooklyn (N. Y.) Rapid Transit Company, through its receiver, has announced that it will purchase all matured coupons from the general consolidated mortgage bonds of the Atlantic Avenue Railroad. The Metropolitan Trust Company will handle the coupons. The amount of bonds outstanding of this issue is $2,241,000 on which the Oct. 1, 1919, and subsequent coupons were in default. The Oct. 1, 1919, coupons down to the April 1, 1922, inclusive are being purchased by the trust company.

Denies $325,000 Debt to Doherty Company.—Bondholders of the Toledo & Western Railroad, represented by Samuel Dority, Toledo, have filed a motion in Federal Court asking leave to file an intervening petition in the suit of Henry L. Doherty and Frank W. Frueauff, of Henry L. Doherty & Company, against the Toledo & Western Railroad. Dority denies that the defendant company is indebted to the Doherty interests in the amount of $325,000 as claimed or to the Toledo Railways & Light Company in the amount of $175,675, and asserts that Doherty and a number of other individuals interested in the company are really indebted to the company through their liability as stockholders of the company.

Abandons Part of Line.—The Lafayette (Ind.) Street Railway, Inc., has announced the discontinuance of service on the Lafayette-Battle Ground line beyond the Tecumseh Trail and the Soldiers' Home. The track beyond Tecumseh Trail belongs to the Indiana Service Corporation, and according to Allison E. Stuart, counsel for the Lafayette Street Railway, is not sound enough to be used. The Lafayette Service Company, which the Lafayette Street Railway succeeds, operated over the track, agreeing to care for the track and roadbed. The former company has not the money to make the repairs and the new company does not feel that it can make the necessary changes. The agreement between the two companies was verbal.

Traffic and Transportation

Agreement in Spokane

After Many Months of Controversy Railway Wins Over Jitney—People Will Decide Issue

A final agreement has been reached between the Mayor and City Council of Spokane and the street railway officials of the city which terminates the warfare between the two bodies, waged bitterly for the last year, over the advent of jitneys in competition last June. Conferences looking to this settlement have been held during the past several weeks with each day's outcome not infrequently contradicting that of the day preceding. Several times it appeared that there was no hope of getting together.

CITY AND RAILWAY OFFICIALS AGREE

As the situation stands, the city officials and those of the two street railway systems, the Spokane & Eastern Railway & Power Company and the Washington Water Power Company, which are to be consolidated under one head, are in accord. It remains now for the people of Spokane to set their seal of approval upon the agreement by voting certain city charter amendments at a special election to be held on May 2. The entire article in the charter relating to franchise is to be placed on the ballot in its proposed revised form for the convenience of the voters so that there will not be the confusion which might result from the voting on the change by sections.

The jitneys, of which there are more than sixty in operation, are not to be relicensed Jan. 1 of next year. In return the railways concede a 6-cent fare by ticket and a 7-cent cash fare to the casual passenger, with universal transfer, and a 4-cent fare for school children. This agreement effective July 1 is for three years.

In the charter amendments that have to be voted upon, it is agreed that the companies may discontinue service upon a year's notice if jitney competition is renewed at any time. It is prohibited from discontinuing service upon any one part of its system in advance of the termination of the franchise for the entire system. The sprinkling of tracks on graded streets by the company is to be continued, although this was one of the burdens which the street car men asked that they be freed from.

Free rides for mail carriers are to be dispensed with, though this does not amount to anything as the section relative to this in the present franchise has been a dead letter and the government has paid for the carriers. Provision is made that all lines must have owl car service and it is probable that metal tokens will be used for the regular patrons rather than selling tickets to them. There is little question but that the people of the city are well pleased to have the controversy settled on so favorable a basis and that they will voice this at the election.

The prevailing rate of fare has been 8 cents on the street cars, with jitneys running with a 5-cent fare. Early last year the State Public Service Commission, after having had the question under consideration for some months and having held a public hearing at which the city officials bitterly opposed such increase, granted the Washington Water Power Company and the Spokane & Eastern Railway & Power Company the right to increase their fares from 6 cents to 8 cents. Mayor Fleming at the time of the hearing announced that the putting into effect of an 8-cent fare would mean the letting loose of jitney competition. He reiterated this upon the announcement of the decision by the commission, which in such decision took occasion to state that it hoped he had not made such statement in earnest and to point out the disastrous effect of such action upon the transportation situation. A committee of influential citizens sought to act as intermediaries among the companies and the Mayor and Council.

MAYOR CARRIES OUT THREAT

A compromise offer of a 7-cent fare was secured by the committee and laid before the Council, which rejected it for the reason, so the members explained, that it was not authoritative and that the 7-cent fare was for tickets, while the legal fare remained at 8 cents. The net result was that the 8-cent fare was put in operation early in June last year and the Mayor immediately took steps to carry out his threats. Shortly nondescript vehicles began to make their appearance on the street. These were succeeded as the weeks passed by better and more commodious vehicles and more of them.

The competition began to be felt more and more by the companies, with the result apparent in a gradual lessening of the frequency of service on practically all lines, the discontinuance of several and the laying off of considerable numbers of railway employees. Reports by jitneys to the city hall indicate that they carried in the peak months approximately 30,000 daily fares. The average street car business previously ran 70,000 fares, so the jitney competition cut the street car patronage almost in half. It is estimated that the fight has cost the traction people about a half million dollars, while the taxpayers of the city have also been called upon to pay costs in maintaining streets for jitney service, some additional paving authorized for them and much more on the wear and tear on paved streets, the latter an item that cannot be determined.

Submits Rate Exhibit

Railroad Commission States Electric Fares in California Are Lowest in United States

In connection with the rehearing of the Hollywood rate case regarding increase of fares on Pacific Electric lines, the California State Railroad Commission has, after the close of the rehearing, submitted to the various communities opposing the fare increases a comparative rate exhibit. The details of the rehearing were given in the ELECTRIC RAILWAY JOURNAL, issue of April 8.

The commission says that the fares in California cities are virtually, without exception, the lowest in the United States. The exhibit was compiled by the engineering department of the commission from information received in response to a questionnaire sent to 100 of the principal electric railways in America and constitutes the latest official compilation on the subject. The report is compiled as of Jan. 1, 1922. The questionnaire requested information as to the present rates of fare, reduced-rate tickets, transfer privileges, length of ride possible and other more technical information.

Referring to the California fares, the report says that with few exceptions, railway fares in California cities were either 5 or 6 cents. It was to be noted that in the cities of Pomona, Redlands, Riverside and Santa Cruz, with a 10-cent cash fare, and Santa Barbara, with an 8-cent cash fare, an endeavor has been made to enable the continued operation of street railway service by increasing fares approximately to their economic maximum. These communities were faced with the possibility of abandonment of service on account of operating losses due to automobile competition and other causes and the present fares may be considered somewhat in the nature of an experiment. In all cases in California where a 10-cent cash fare obtained it was a question either of discontinuing service entirely or collecting the maximum fare, and the cities chose the latter alternative.

Data were collected for the compilation from seventy-nine cities. From this number twelve cities have a 10-cent fare, one a 9-cent fare, fifteen an 8-cent fare, thirty a 7-cent fare, twelve a 6-cent fare and nine a 5-cent fare. Most of the cities reporting, especially those having the higher cash fares, allow a discount on the purchase of tickets or tokens in quantity. In a number of cases an additional charge is made for transfers.

The report also gave consideration to the maximum length of ride and said that on a unit fare it varied according to the different cities from approximately 2 miles in smaller towns to a maximum of 34 miles in Chicago.

In Los Angeles the average length of ride on the Pacific Electric lines performing local service is found to be 5 miles.

Six-Cent Fare Ordered in Chicago

New Surface Lines' Rate to Go Into Effect May 1—Rate Justified by Eliminating Several Obligations Specified in 1907 Franchise Ordinances

BEGINNING May 1 the rate of fare on the Chicago Surface Lines will be 6 cents if the order of the Illinois Commerce Commission entered April 8 is carried out. The new order is "tentative, temporary and experimental" and is to be effective until Jan. 1 unless changed in the meantime. The commission expresses the belief that the 5-cent fare order which was enjoined by the federal court last November could have been made effective if there had been co-operation between the companies, their employees and the city. The companies have been collecting an 8-cent fare since July, 1920. The new order rescinds and annuls the 5-cent fare order of Nov. 23, 1921, and it is expected that steps will be taken to dismiss the proceedings in the United States court where a master in chancery was about to begin taking evidence for the purpose of deciding whether the injunction should be made permanent.

Will Likely Ask for Rehearing

By this latest order the companies' return is limited to 5 per cent. Under the order of the previous commission the rate of return was fixed at 7½ per cent, although the companies last year earned only 6½ per cent on the allowed valuation. It is understood that the companies regard the 6-cent order as confiscatory. No announcement was made as to what steps they would take, but it is likely they will ask for a rehearing and the commission will be allowed twenty days under the law to decide this question. That could be settled before the date on which the order is supposed to become effective.

Last year the gross income of the surface lines was $60,343,733 and the expense, including taxes, was $46,965,-151. The commission figures that the reduced fare will attract about 50,000,-000 additional revenue passengers, so that the gross earnings will be $47,916,228. Last year the companies used 12.78 per cent of the gross for maintenance and 8 per cent for renewals. It is proposed to combine these two accounts and allow a total of 16 per cent, which would save $4,759,187. This is practicable, it is claimed, because there is no deferred maintenance and the property is in a condition of good operating efficiency.

The companies last year carried to the injuries and damages fund $2,301,-224, and actually spent $1,762,778 from this amount. The damage reserve fund is now $2,490,359. The commission does not believe that a fund of this character should be accumulated and proposes to cut the allowance to the extent of $1,001,224 during this year. It is also proposed to save $700,000 in the allowance for materials on the theory that prices have gone down 20 per cent below the average last year. An interesting feature of the decision is the disallowance of any appropriation for sweeping, cleaning and sprinkling streets, thereby saving $607,-000 per year. On this point the commission says:

> Whatever may be the relations between respondent companies and the city of Chicago, any obligation which may be in the license contracts of said city requiring respondent companies to pay certain portions of the cost of sweeping, cleaning and sprinkling the streets is not binding upon this commission in the exercise of the police power of the State in the fixing of rates of fare to be charged and collected in the city of Chicago, and is not a proper charge to operating expenses of said companies.

Proposed Savings Total Millions

Summarizing the savings proposed by the commission, it is found that these total $7,079,411 from operation and $2,403,131 from the allowed rate of return. By inference the city will also lose its share of receipts because there would be no surplus to divide. This would save another $2,944,963. These savings would total $12,427,505, and on this basis the commission figures that the total expense will be $39,-885,000. Deducting this from the estimated gross of $47,916,000, the net return of approximately $8,000,000, or 5 per cent on the former commission's value of $160,000,000, is arrived at.

The commission agreed with the companies' estimate that taxes would again increase this year in spite of a 46 per cent increase last year and it allowed $407,000 additional for this item. It announced that further attention will be given to the valuation of the properties and for the present it would not disturb the previously allowed figure of $160,609,761. On the question of return, it said the evidence showed that interest rates have decreased 1½ per cent from peak costs and, therefore, 5 per cent would be a reasonable allowance.

On the question of high wages the order reads:

> This commission has been criticised for not ordering an immediate reduction in operating expenses of respondent companies, especially in regard to salaries and wages. Under the Illinois commerce act, this commission has no authority to make such a direct order. Where, however, it is perfectly apparent, as it is in this case, that the operating costs of a company are excessive in proper relation to the cost of labor and industries requiring similar skill, to the prices paid for the same service by similar utilities in other cities of the United States, this commission believes that not all of this excess cost should be reflected in the rates of fare charged and collected, but that a certain portion thereof should be borne by the company itself.

The maximum wage for trainmen in Chicago is 80 cents an hour and the commission points out that when this rate was fixed in 1920 the cost of living in Chicago was about 114 per cent over that of December, 1914. In December, 1921, the order says, this had receded to a point where it was 72.3 per cent over the 1914 level, when the men were receiving 32 cents an hour. Exhibits in the case showed further that the maximum wage for trainmen in a number of large cities had dropped from an average of 61.1 cents in 1920 to an average of 54.9 cents, a decrease of 10.1 per cent from the peak. Evidence showed also that from 1914 to 1918 the Chicago wage was 4.6 cents an hour higher than other properties and on this basis it would now be 60.3 in Chicago. To get to this level, it is pointed out, there would have to be a reduction of 24.6 per cent. It was stated during the hearings that the companies were negotiating with the men for a reduction in wages at the time the fare fight was renewed. The contract since that time has been continued on a month to month basis.

Big Issue Before New Council

The fare proposition in Madison, Wis., looms up as a big issue before the newly-elected City Council. The Madison Railways Company has submitted a schedule of fares which has the indorsement of the City Attorney and Mayor. It includes a 10-cent cash fare, 3-cent fare for children, seven tokens for 50 cents and books containing thirty tickets for $1.50. The company agrees to this rate if the city relieves the company from all obligations to surface the railway zones in certain streets. This work has been held up pending an agreement with the company. Just what action will be taken if the city fails to approve of this action street railway officials decline to say. It is expected, however, that the new Council will take favorable, or at least some definite action within six weeks.

Recommends Increased Railway Service

Glendale's proposal to operate a municipal bus line in Los Angeles, Cal., was rejected recently by the Los Angeles Board of Public Utilities. In rejecting the request, the board considered the reports of its chief engineer, H. Z. Osborne, Jr., and also briefs submitted by the Pacific Electric lines and the city of Glendale. Recommendation that the Pacific Electric increase its service on its Glendale line during the morning and evening rush hours was also voiced by the board. D. W. Pontius, vice-president and general manager of the company, stated that the railway would gladly comply with the recommendations. Commissioner Leeds of the board, in explaining his negative vote, said he believed that the paralleling of the Pacific Electric Railway line with a bus line for the entire distance was unfair competition. Commissioner Kennedy stated among other things that he did not think that this was any time to cripple any public utility, whether privately or publicly operated. Details of this municipal bus project will be given in BUS TRANSPORTATION for May.

One Dollar Weekly Pass for Terre Haute, Too

The Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., has made application this week to the Public Service Commission of Indiana for permission to install on the 5-cent city cars of Terre Haute the unlimited-ride transferable weekly pass to be sold at $1. This will make the sixth property in the United States and the second in Indiana to use this form of transportation, the first five properties being Racine, Kenosha, Youngstown, Beaver Valley and Fort Wayne.

To prepare the carmen and the public for this innovation, E. M. Walker, general manager, invited Walter Jackson, originator of the pass, to aid in the publicity campaign. Mr. Jackson called on both the leading merchants and theater managers of the city to secure their help in pushing the pass as a producer of the off-peak travel that means so much to them. He also addressed the night and day carmen, explaining the meaning of the pass from both the fare-handling and business-building standpoints.

Mr. Walker's suggestion that they be placed on a commission basis met such a cordial response that a number of operators said they would do more than sell passes on the card—they would offer them to their neighbors in their off hours.

The local papers which were represented at these meetings have published good accounts of the pass, so that the pass is already a matter of general knowledge, even in advance of the advertising campaign prepared for newspaper and car window use. The company hopes to put on pass No. 1 for the week beginning May 1.

Boise Revenue Gains in Second Week

The second week of the 7-cent cash fare on the Boise (Idaho) Street Car Company and the Boise Valley Traction Company shows an increase in passengers and revenue over the first week of the new rates. The first week showed a falling off in traffic and receipts as compared with the last week of the lower fares. During the second week the Boise Street Car Company carried 698 more passengers than during the first week, and collected $30 more in fares. As compared with the corresponding weeks in February, the first week of the new rates showed a decrease of $106 on the Tenth and Eighteenth Street belt lines of the Boise Valley Traction Company in revenue and of 3,705 in passenger traffic, while the second week showed a revenue decrease of $61.79 and passenger decrease of 2,668. The South Boise line during the first week of the new fares reported a decrease, as compared with the last week of the old schedule, of $27 in revenue and 686 in passengers. For the second week it reported an increase of thirty-eight in passenger traffic and $9.08 in revenue over the corresponding week in February. The announcement of new rates was given in the ELECTRIC RAILWAY JOURNAL, issue of April 8.

Fare Increase Sought in Mobile

The Alabama Public Service Commission has under advisement a petition of the Mobile Light & Railroad Company for an increase in fares. The company has requested the right to charge an 8-cent cash fare instead of the present 7-cent one and an increase in the ticket rate from 6 to 7 cents. At present four tickets are sold for 24 cents.

Opposition to the proposed increase was registered with the commission by the city of Mobile. A request was made that the old contract rate of 5 cents be re-established. This contract was suspended as an emergency measure about two years ago to permit the company to charge the present rates, to meet the increased costs to which it was then subjected. The Mobile Light & Railroad Company now contends that not only have costs failed to be reduced, but that losses in traffic and the suspension of shipbuilding activity at the Chickasaw plant have created losses in revenue which if continued throughout the present year will cause a deficit of $162,700.

The commission has determined to have a valuation of the property made before rendering a final decision on rates. The commission's own engineers will value the property. The company has already had a valuation made on its own account. According to report, this valuation showed that the property had cost a minimum of $4,050,000, and that it would now cost $6,506,000 to reproduce.

One of the appraisals of the properties of the Mobile Light & Railroad Company is being made by the firm of Harry Barker & Robert C. Wheeler of New York City and Albany, N. Y., working in connection with Capt. Charles T. Long, the company valuation engineer. The field work is being done by a force of about fifteen under the direction of Capt. Harry Barker, who will present the results before the Alabama Public Service Commission. The commission engineer, L. M. McDonnell, is making a concurrent check and appraisal.

Railway Loses Fare Suit

In an opinion by Justice Brandeis the United States Supreme Court recently decided against the Galveston (Tex.) Electric Company in its suit to enjoin the city of Galveston from putting into effect a 5-cent car fare. The company contended that this rate was confiscatory. The District Court for the Southern District of Texas denied the injunction on the ground that it had no right to interfere with the fixing of rates, which was a legislative function, unless it appeared beyond doubt that the rates would deny just compensation, which it was not convinced was shown in this case.

Transportation News Notes

Children's Fares to Be Reduced.—Officials of the Pine Bluff (Ark.) Company have announced that they are working on a plan for reduction of the fares charged school children. A reduction to 3 cents has been asked, and the officials state that it is probable that a reduction to less than 3 cents will be made.

Freight Rates Reduced 16 and 20 per cent.—Freight reductions of 16 and 20 per cent, effective April 10, have been announced for the electric lines of the Cleveland, Southwestern & Columbus Railway, Columbus, Ohio. This will make the rates equal to those prevailing on steam roads. E. L. Hukill also announced a similar reduction for the Columbus, Deleware & Marion Electric Company, effective April 20.

Reduced Rates Announced. — The Western Light & Power Company, Boulder, Col., through its general manager recently announced a reduction in railway fares approximating 20 per cent. This step was voluntary on the part of the company to induce more people to ride. Single rides will be 10 cents, the present rate; strips of seven tickets can be bought for 50 cents and books of twenty rides will be sold for $1.25 instead of $1.50.

Seek Lower Rates.—Six separate petitions have been presented to the City Council of Fort Smith, Ark., by 370 citizens of that city asking that the Council order the Fort Smith Light & Traction Company to reduce its trolley fares from 7 to 5 cents. The petitions call for transfers and half fares for children. The Council has set April 13 as the date for a hearing. It is said that the petitions were circulated shortly after the platform men employed by the traction company accepted a cut in wages of 6 cents an hour. The negotiations lasted for five weeks, ending with the men signing the only contract offered by the company.

Fares Reduced on Grays Harbor Lines.—A fare reduction from three tickets to four tickets for 25 cents has been ordered by the Department of Public Works of Washington, on all lines of the Grays Harbor Railway, Light & Power Company. This railway serves Hoquiam, Aberdeen and Cosmopolis. The reduction is for an indeterminate trial period. Cash fares continue at 10 cents. The reduced rate is effective April 30. Trial of 10-cent cash fare and three tokens for 25 cents resulted in a loss to the company, but with the lower fare the company hopes that increased patronage, particularly in intercity traffic, will more than make up for the reduction. One-man cars and other operating economies have been instituted by the company. This matter has been referred to previously.

New Publications

Fire Tests of Building Columns

By the Associated Factory Mutual Fire Insurance Companies, the National Board of Fire Underwriters and the Bureau of Standards. 389 pages, illustrated.

This bulletin reports the results of an experimental investigation of the resistance of building materials and loaded columns when exposed to fire or to fire and water, with the record of characteristic effects.

Bibliography of Petroleum and Allied Substances (1918)

By E. H. Burroughs. Bulletin No. 189. United States Bureau of Mines, Washington, D. C.

This bulletin contains a complete list of all material appearing in periodicals during 1918 on the subject of petroleum. The references are classified according to the Dewey system and a short résumé of each article is given.

Motor Truck Transportation

By F. Van Z. Lane. Published by D. Van Nostrand Company, 8 Warren Street, New York.

This book is a summary of the principles governing the success of motor truck transportation, practically all the space being devoted to freight carrying vehicles. Operating costs, motor truck vs. other modes of transportation, bodies and other load carrying equipment, are all discussed in a general way. The author is the lecturer on motor truck transportation at New York University.

Signaling on the Berlin Elevated and Underground Railways

Published by Julius Springer, Berlin, Germany. 188 pages; illustrated.

This gives a very complete description of the types of signals and signal equipment together with methods of installation with circuit diagrams for the Berlin (Germany) Elevated & Underground Railways; also similar information for the London Underground and New York subways. It puts in permanent form information not available elsewhere.

Railway Statistics of the United States for 1920

By Slason Thompson, Bureau of Railway News and Statistics, Chicago, Ill.

This is the eighteenth year that Mr. Thompson has published his little book of statistics of the railroads in this country and abroad. The data relate not only to rolling stock, mileage and finances for both American and foreign roads but to many allied topics. The book contains 147 pages and will be found very useful for any one looking up group statistics of the steam railroads. Many of these are in comparative form. Editorial comments accompany many of the figures given.

American Electricians' Handbook

By Terrell Croft, consulting engineer. Second Edition, Published by McGraw-Hill Book Company, Inc., New York. Cloth 7 x 4¼ in. 789 pages. 900 illustrations.

A second edition of American Electricians' Handbook, by Terrell Croft, has been published by the McGraw-Hill Book Company, Inc. This popular handbook has been found very useful by practical electricians, and is particularly noted for its clear explanations and good illustrations.

Effect of Moisture Content on Concrete

A Study of the Effect of Moisture Content Upon the Expansion and Contraction of Plain and Reinforced Concrete. By Torata Matsumoto. Bulletin No. 126 of the Engineering Experiment Station, University of Illinois, Urbana. Sent upon request.

This study contains some of the results of experiments made by the author, who did graduate work in Theoretical and Applied Mechanics at the University of Illinois in 1918. He was for many years an engineer on harbor work in Formosa and wished to determine the lasting qualities of concrete in a damp and tropical climate.

Sistema de Alimentazione Della Linee a Trazione Elettrica a Corrente Continua

By Enrico Sorelli, Brescia. 46 pages, paper.

This pamphlet describes the transmission system for direct current electric railways devised by Mr. Sorelli, an Italian engineer. The purpose of this system is to reduce the number of converting substations and centralize the distribution of energy by the use of a system of double feeders at different voltages. He states that by the use of his system the tension is equalized throughout the line and that the drop is reduced to very small fraction.

The most interesting feature of the booklet is a technical description of conditions on the Gardone-Travernole electric railway where his system is in use.

Federal Power Commission Report

Government Printing Office, Washington, D. C., 1921

The first annual report of the Federal Power Commission, which covers the fiscal year ended June 30, 1921, has been published. The report states that the commission's jurisdiction is limited to the consideration of projects designed to produce water power; further, that the body has the authority to grant permits or licenses for constructing, maintaining and operating which have previously been approved by the International Joint Commission. On Nov. 1 the commission had received 260 applications which aggregated 11,060,000 primary horsepower and 16,826,000 hp. of estimated installation. The applications affected thirty-three states, the District of Columbia and the territory of Alaska. This estimated installation is approximately twice the horsepower so far developed in the United States.

The Federal Power Commission consists of the Secretaries of War, the Interior and Agriculture, and O. C. Merrill, who is executive secretary.

Legal Notes

CALIFORNIA—*Ejectment not Proximate Cause of Injuries Sustained More than ¾ Mile from Place of Ejectment.*

A railroad was not liable for injuires to person on the track on the theory that it had negligently ejected him for failure to produce a ticket or fare, though he was in a helpless condition as a result of intoxication or other causes, where injuries were sustained three-fourths of a mile from the place of the ejectment, the ejectment in such case is not the proximate cause of the injuries. [Lammers vs. Pacific Electric Ry., 199 Pacific Rep. 523.]

FEDERAL COURTS—*Payment of Interest into Special Fund Held to be a Contract Requirement.*

Where a city, in an ordinance authorizing the issuance of bonds, irrevocably obligated itself to pay into a special fund from the gross revenues of its street railway system before each installment of interest falls due a sum equal thereto, and requiring the city treasurer one month prior to this interest date to set aside the amount thereof, the provision for setting the interest aside is part of the contract obligation binding on the city and not merely a directory provision. [Puget Sound Power & Light Co. vs. City of Seattle et al., 271 Federal Rep. 958.]

GEORGIA—*Company May Reassign Seats in Carrying Out Jim Crow Law.*

Where a State law requires the separation of white and colored passengers in street cars, a conductor has the right not only to assign a seat at the time a passenger enters the car, but to make such necessary reassignments as the exigencies of the traffic may require. [Savannah Electric Co. vs. Lowe, 108 Southeast Rep. 313.]

MASSACHUSETTS—*Conditions Precedent to Becoming Passenger.*

Any one in proper condition, who takes hold of the grabhandle, places his foot on the step and begins to enter a car is a passenger, if the car is at a regular stopping place in the street for the purpose of receiving passengers and persons were invited to enter and become passengers. [Franz vs. Holyoke Street Railway, 132 Northeast. Rep. 270.]

MICHIGAN—*City Has Power to Oust Railway on Expiration of Franchise.*

The Common Council of Detroit under the charter of the city has power to exercise control over the use of its streets and to direct the institution of a suit to oust a street railway company from the streets as to which its franchises from the city have expired. [City of Detroit vs. Detroit United Ry., 184 Northwest Rep. 516.]

Digitized by Google

MISSOURI—*Excessive Speed Not Necessarily Cause of Accident.*

Negligence not being actionable unless it produces an injury, an instruction authorizing recovery must require a finding that the negligence complained of was the proximate cause of the injury. Hence, in an action for the death of a pedestrian struck by a street car, an instruction that if the car was being run at a speed greater than 15 m.p.h. and the deceased was exercising ordinary care for his own safety, the company would be liable, was erroneous as not requiring a finding of specific and definite facts, from which it necessarily followed that the negligence was the cause of the injury. [Lackey vs. United Railways 231 Southwest. Rep. 956.]

MISSOURI—*Street Railway Held Not Negligent in Maintaining Defective Grabhandle.*

A street railway could not be held negligent for maintaining a grabhandle on a street car which contained a defect not discoverable except by breaking the brass casting holding the rail, where the grabhandle was inspected from time to time by stepping on the step and jerking on it, as far as injuries to one not a passenger was concerned. [Galloway vs. Kansas City Rys., 223 Southwest. Rep. 385.]

MISSOURI—*Denial by Commission of Railway Company's Right to Issue Bonds Held Impairment of Contract Right.*

Under the terms of a railway company's mortgage it has the right to issue bonds to cover additions and extensions upon showing net earnings double its interest charges; when, however, it proposed to issue bonds on additions it was found that part of the expenditures were made more than five years prior to its application to the Public Service Commission for authority to issue such bonds, the delay in making such application being due to the fact that the company could not show the requisite net earnings prior to its application. By the Public Service Act of the State, the commission is prohibited from authorizing the issuance of bonds for additions made more than five years prior to the application. Nevertheless the court held that the application should be granted in spite of the law, because otherwise the law would be unconstitutional, as impairing the company's contract right to issue such bonds, contrary to Const. U. S. Art. 1, Sec. 10. [State ex rel. Joplin & Pittsburgh Ry. vs. Public Service Commission, 223 Southwest. Rep. 388.]

SOUTH CAROLINA—*Place in Street Where Street Car Passenger Alights Is Not a Station.*

A public street in a city, at a point where a street car stops for passengers to alight, is not to be regarded as a passenger station, in determining the duty of the company toward its passengers, and a passenger who stepped on a banana peel and fell cannot recover. [Thompson et al. vs. Greenville Traction Co., 107 Southeast. Rep., 911.]

Personal Mention

J. A. Crilly Has Long Service

"I hope John A. Crilly will be with the Connecticut Company many more years," declared Nathaniel J. Scott, manager of the Hartford Division, in commenting upon the fifty-seventh anniversary of Mr. Crilly's service, which was celebrated April 7. Mr. Crilly entered the company's ranks in 1865, when it was known as the Hartford & Wethersfield Horse Railway, and for many years was chief claim adjuster. Since 1916, when he retired from this position, he has been doing special work for the company.

Mr. Crilly's first work with the company was taking care of horses at $8 a week. Even his next work was still somewhat distantly removed from modern electric railways, for he did the blacksmithing for the company. He became yard foreman, and when the company changed from horse cars to electric apparatus Mr. Crilly was in charge of selling the horses. He sold 750 and is proud of his record. Thereafter he was acting superintendent, by appointment of President E. S. Goodrich, until 1895, when he became chief adjuster. He was succeeded in that work by his son, John A. Crilly, Jr.

The service record of Mr. Crilly is excelled by few others in the country.

Los Angeles Railway Makes Changes

Changes in the auditing department of the Los Angeles (Cal.) Railway have been announced. O. J. Hastings becomes assistant auditor. He was formerly chief clerk. This position has been filled by G. W. McDonald. H. E. Gaskell has been appointed chief accountant and statistician, and S. J. Nock head bookkeeper and accountant.

George E. Falk, formerly safety director for Henry L. Doherty & Company, with headquarters at their New York office, has been assigned to the Community Traction Company and the Toledo Edison Company, at Toledo, as head of all the safety work. He plans a general all-year campaign on "safety" and has already secured the co-operation of the Toledo Automobile Club and the public schools in an effort to put over a safety course through the public schools. Mr. Falk has been with the Doherty interests for nine years. He started in the gas offices of subsidiaries in New York State.

George P. Good, who has served for many years in the transportation department of the Philadelphia (Pa.) Rapid Transit Company, has been appointed superintendent of transportation. Elbert G. Allen has been appointed chief engineer. Mr. Good started work with the company twenty-eight years ago, when cable cars were still used. Mr. Allen, a graduate of the Massachusetts Institute of Technology, was associated in an advisory capacity with Stone & Webster in the construction of Hog Island. His appointment has been referred to previously in the ELECTRIC RAILWAY JOURNAL.

Obituary

Howard E. Huntington

Howard Edward Huntington, vice-president of the Los Angeles (Cal.) Railway and only son of Henry E. Huntington, president of the company, died March 27 at the age of forty-six.

Private burial service was conducted on March 29 and as a mark of respect all trolley cars in Los Angeles stopped for one minute at 10 a.m., the time of the funeral. All machinery, except substation motors, was stopped for five minutes and the main offices closed for half a day.

Mr. Huntington began his railway career in 1894 with the late Epes Randolph, builder of the Southern Pacific Railway of Mexico. In 1903 he began his actual experience in Los Angeles traction activities as a worker in the electrical department of the shops.

Upon the death of J. A. Muir, then general manager, Mr. Huntington was appointed to the position.

He continued as active head of the railway until 1911 when he made a trip to Europe for his health. He retained the title of general manager until 1918, when George J. Kuhrts, the present general manager, was appointed. During the war he served as a dollar-a-year man with the shipping board and supervised important phases of shipbuilding work at Los Angeles Harbor and Oakland, Cal.

Knox Taylor, president of the Taylor-Wharton Iron & Steel Company, and vice-president of the American Railway Business Association, died April 4, at his home in High Bridge, N. J. During the war his company aided in supplying railway track material for use abroad, and he himself was the representative of the leading manufacturers of this product in dealings with the Government. Mr. Taylor worked through all the departments of the Taylor Iron & Steel Company, and finally became president. In 1912 this company purchased the William Wharton, Jr., & Company, Inc., and the Philadelphia Roll & Machine Company, and Mr. Taylor became president of the new Taylor-Wharton Iron & Steel Company. The Taylor and Wharton Companies had originated the use of manganese steel in trackwork.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

New Electric Line Planned for Florida

Sanford, Fla., suburban trolley lines linking up Sanford (Fla.) and intermediate points south to Plant City, where it is confidently expected the Tampa Electric Company will meet it, is the plan being promoted by Frank J. Ryan, vice-president of the Orland Mortgage & Loan Company, and F. F. Ange, president of the Bank of Orange, Orlando, Fla. The proposed lines would provide a scenic route through Florida linking with the St. John's River north from Sanford so as to appeal to the tourists. Orlando would be headquarters and the route would include Winter Park, Orlando, Kissimmee, Loughman, Haines City, Lake Alfred, Auburndale, Lakeland and Plant City, with spurs out of Orlando to Daytona and Tavarese. It would offer competition to high freight rail rates by a joint trolley and water rate to Jacksonville and an all-trolley rate to Tampa and Orlando, the three principal consuming centers of the region. One of the biggest lumber mills in the south is at Loughman and its owners are understood to be interested in the project. Mr. Ryan's estimates are that it will require $12,000,000 to lay the lines and equip the various companies which would operate over the tracks. Mr. Ryan states that negotiations have progressed with Northern financiers far enough to practically assure consummation of the project.

Ohio Road Will Buy Power

Indiana, Columbus & Eastern Traction Co., Springfield, Ohio, will operate cars with power furnished by the Dayton Light, Heat & Power Co. not later than June 1, according to a statement issued today by G. D. Nicoll, superintendent of power equipment for the road. At present the company is supplying its own power, but the contract with the Dayton company will furnish service cheaper than the traction line can produce it, company officials say. New rotary converters are being installed at the various substations and new substation buildings are being constructed at Medway on the Dayton-Springfield division and at Donovan's Hill on the Springfield-Lima division. Operation of the power plant at Medway will stop as soon as the Dayton service begins and it is regarded as probable that the plant will be entirely demolished, although some of the executives are said to favor the retention of the plant for emergency purposes. The Dayton service will be transmitted at 33,000 volts, the same as at present, but with alternations at 60 cycles instead of 25. It was this change which required the installation of new converters. The contract between the traction line and the Dayton company was recently approved by the State Public Utilities Commission.

Orders for 151 Safety Cars Placed

The Stone & Webster Company recently placed orders for 136 Birney safety cars. Of these eighty-nine were ordered from the St. Louis Car Company and forty-seven from the American Car Company. These cars will be used as follows: Houston, Tex., 35; Columbus, Ga., 3; Savannah, Ga., 30; Tampa, Fla., 24; Pensacola, Fla., 8, and Jacksonville, Fla., 36.

In addition to these the Chicago, South Bend & Northern Indiana Railway has placed an order for fifteen safety cars with the J. G. Brill Company.

Advice on Foreign Market Conditions

A feature of the ninth National Foreign Trade Convention in Philadelphia, to be held on May 10, 11 and 12, will be the furnishing of trade advisers to give information on foreign trade questions. These advisers have been selected from business men who have spent years in foreign trade and they will furnish information regarding market, shipping, finance, sales and advertising methods, and other items considered as obstacles to entering foreign markets.

Westinghouse Air Brake Report

The Westinghouse Air Brake Company earned $1,412,490 net during 1921. This was exclusive of loss due to shrinkage in inventory prices, amounting to $2,307,854, charged against reserves created for that purpose. With this adjustment the inventory stands at $10,802,328, as compared with $15,628,811 on Dec. 31, 1920. In commenting on the general situation the officers say:

"As outlined in our last annual report for the stockholders, we entered the year 1921 with a fair volume of unfilled orders on hand, and as a consequence our shipments for the first quarter were fairly satisfactory; but on account of the general business depression and particularly the curtailing of purchases by the railroads of the country, our orders received during the year under review amounted to less than 50 per cent of normal, which resulted in plant operation and shipment for the year of approximately this same percentage. Under existing conditions, it would be difficult and useless to endeavor to forecast the future."

San Francisco Car Contracts Awarded

Contracts were awarded on April 4 for twenty new cars for the San Francisco Municipal Railways. The contracts are for the construction and assembling of cars of the center entrance type, at a cost of almost $200,000. The bids accepted, according to City Engineer M. M. O'Shaughnessy, are approximately $1,200 cheaper per car than the estimate made several months ago. The contract for the body and trucks went to the American Car Company of St. Louis at $5,187 per car; trucks and wheels to the same company at $1,312.50 per car. The Westinghouse Traction Brake Company was awarded the contract for the air brakes, the total contract being for $11,363.73. The Westinghouse Electric & Manufacturing Company was given the contract for the electrical apparatus, motors, etc., the contract totaling $49,503.66.

General Electric Submits 1921 Report

The thirtieth annual report of the General Electric Company, Schenectady, N. Y., reports orders received in 1921 were $179,722,000, as compared with $318,470,438 for 1920. For the first quarter of 1922 orders received have been at an annual rate in excess of $200,000,000. Net sales billed were $221,007,992, compared with $275,758,488 for 1920. A surplus in excess of cash dividends for the year 1921 was $8,243 290. C. A. Coffin, chairman of the board of directors, in a statement to the stockholders, characterized 1921 as an exceptionally trying and difficult year "with its contraction in business and the unavoidable processes of readjustment."

The report states that inventories in factories and warehouses and on consignment have been taken with the usual care and valued in accordance with the custom of the company at cost or market, whichever is lower. Investment securities have been carefully revalued according to the statement and a reserve of $3,700,000 has been established to safeguard the company's interest in associated manufacturing and selling companies against inventory or other shrinkage. They are now carried at a net value of $75,326,382.

Metal, Coal and Material Prices

Metals—New York	April 11, 1922
Copper, electrolytic, cents per lb.	12.875
Copper wire base, cents per lb.	14.125
Lead, cents per lb.	5.05
Zinc, cents per lb.	5.25
Tin, Straits, cents per lb.	30.375
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4 60
Somerset mine run, Boston, net tons	2.10
Pittsburgh, mine run, Pittsburgh, net tons	.....
Franklin, Ill., screenings, Chicago, net tons	2 625
Central, Ill., screenings, Chicago, net tons	1.875
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y. cents per lb.	5.90
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$1.97
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	84.00
White lead, (100-lb. keg), N. Y., cents per lb.	12.25
Turpentine (bbl. lots), N.Y., cents per gal.	88.00

Rolling Stock

Columbus, Delaware & Marion Electric Company, Columbus, Ohio, contemplates the addition of one more freight car owing to increase in business.

Houston (Tex.) Traction Company plans to purchase immediately thirty-five new cars at a cost of $270,000, according to an outline of the company's proposed improvements submitted to the City Council by Luke C. Bradley, district representative of Stone & Webster. Mr. Bradley also told the City Council that the company will paint and overhaul thirty-six cars it now owns that have been in the carhouses unused for some time.

Chicago (Ill.) Surface Lines expect to be in the market very soon for 100 new cars. Of these, seven will be trailers to replace the trailers burned in the Devon carhouse fire which occurred in January. The others will probably be of the double-truck one-man safety type, like the sample recently built and described in the ELECTRIC RAILWAY JOURNAL for Jan. 14, 1922. The insurance money received for the cars destroyed in the Devon fire is sufficient to finance a large proportion of these new cars.

Track and Roadway

Houston (Tex.) Electric Company has begun to double track its line on Lorraine Street from Gano to Maury Streets.

Pennsylvania & New Jersey Railway, Trenton, N. J., is placing a new curve in the road at Hulmeville, Pa., and otherwise repairing the road in that section.

Municipal Railway of San Francisco received bids on March 29 for track construction on Liberty Street between Church and Sanchez. The cost of the work will be approximately $60,000.

Indiana Service Corporation, Fort Wayne, Ind., will soon start work on the double tracking of the West Main Street line, according to S. W. Greenland, vice-president and general manager. The franchise for this work was granted last year.

Michigan Railway, Kalamazoo, Mich., will start work on its $100,000 improvement program just as soon as warm weather comes. The principal item calls for the relaying of track on Portage Street from Washington Avenue to Lovell Street.

Public Service Railway, Newark, N. J., through Harry C. Stevenson, its representative, has informed the Haddonfield, N. J., city officials that the corporation will make repairs in King's Highway in the early spring. Mr. Stevenson made this announcement after an inspection of the road.

Murphysboro & Southern Illinois Railway, Murphysboro, Ill., has announced through its president that it will extend its interurban line from Carbondale to Herrin, work beginning about May 1. The citizens' subscriptions to the preferred stock justified the extension.

Harrisburg (Pa.) Railways will probably begin the work about April 1 of improving North Third Street in front of the Capitol and will include paving of the Walnut Street stretch on the south side of the Capitol. The trolley tracks now in Third Street will be shifted to allow for another track and the west side curbing will be moved for widening the sidewalk.

New Jersey & Pennsylvania Traction Company, Trenton, N. J., may be forced to provide additional rails on West Hanover Street. This action is urged so that cars from the Princeton and the Pennsylvania lines can travel on the right hand side of the street. There are two different gages of tracks compelling the cars to travel on the wrong side of the street. The traction company asked that the city cut down the width of the sidewalks instead of putting the corporation to so great an expense. It is said that the cost will amount to about $75,000.

International Railway, Buffalo, N. Y., in co-operation with the city in its plans for repaving city streets, rebuilt during 1921 more than 20 miles of track. The rehabilitation also represents the complete overhauling of 334 cars, renewal of 38 miles of trolley wire and many other improvements and betterments. The expenditure thus incurred, amounting to over $3,000,000, entirely consumed the appropriation made from 1921 earnings for maintenance and renewals and approximately $500,000 of working capital provided by the stockholders.

Memphis (Tenn.) Street Railway, with the Mayor's consent, has made final arrangements for the extension of the crosstown line from Agnes Place to McLemore and the connection of two links in the railway chain on McLemore Street, making a through crosstown route from Poplar and Cleveland Streets to Riverside Park. The company is also making rapid progress in laying its tracks across the Viaduct just erected at McLemore Street over the Yazoo & Mississippi Valley and the Illinois Central Railroad system tracks. The double tracks will first be laid, after which the concrete will be put in. The work is being done under the direction of A. E. Yarbrough of the car company construction department.

Power Houses, Shops and Buildings

Duquesne Light Company, Pittsburgh, Pa., which furnishes power for the Pittsburgh Railways, has authorized the Dwight P. Robinson Company to install two additional boilers of 22,914 sq.ft. of surface and to design and construct additions to the company's high-tension substation.

New Orleans Railway & Light Company, New Orleans, La., will probably erect a new office structure instead of repairing the old building recently damaged by fire. The new building if constructed will be five stories in height and will cost about $500,000. Receiver O'Keefe has had a conference with the security holders on the subject of constructing this new building upon the site of the former quarters of the company.

Philadelphia Electric Company, which supplies power to the Philadelphia Rapid Transit Company, has just placed an order for sixteen 3,750-kva. single-phase transformers for operation at 60 cycles, with a total capacity of 600,000 kva. The total cost of the transformers will be approximately $100,000. The contract for these transformers is awarded to the Westinghouse Electric & Manufacturing Company, and they are to be used in various substations. They are duplicates of approximately thirty similar Westinghouse units now in operation.

Trade Note

Canton Culvert & Silo Company, Canton, Ohio, manufacturers of "Acme" (Nestable) and "Imperial" riveted corrugated metal culverts, was awarded on March 10 the annual contract for supplying the Pennsylvania State Highway Department's requirements for corrugated metal culverts this season. The contract approximates 42,000 ft. of corrugated culverts.

New Advertising Literature

Ohio Brass Company, Mansfield, Ohio. has issued a folder which describes with pictures its Type A-Ear with its improved Under-run type of construction installed.

Sprague Electric Works, New York, N. Y., has issued a circular descriptive of narrow-unit panelboards of the safety type. This panel is an economy in wall space and price.

Stumpf Una-Flow Engine Company, Inc., Syracuse, N. Y., has issued a Lefax sheet describing and giving information regarding the performance of its una-flow steam engine.

General Electric Company Schenectady N. Y. has just issued descriptive leaflets of type LG-116 indoor disconnecting switches and type QC-3 quick-break lever switch.

Electric Power Club, 1017 Olive Street, St. Louis, Mo., has recently published a handbook on controllers for electric motors. This pamphlet contains simple descriptions of controllers and definitions of the terms used in that connection. Words which do not appear in most dictionaries are explained simply.

Volume 59 New York, Saturday, April 22, 1922 *Number* 16

Purchase of Detroit Lines Approved by Voters

MAYOR COUZENS of Detroit will soon be free to put into full effect his idea of how best to run a municipal street railway. At the election there on Monday the voters cast their ballot to sustain him in his effort to municipalize the entire city system. The Detroit United city lines will be taken over at the price of $19,850,000, to be paid with a down purchase of $2,770,000, the rest of the price to be paid in installments. The present municipal system will now be tied in with the lines which the Detroit United has been operating, and the United States will witness the most important experiment in municipal ownership of a city railway system so far made in this country.

Jim Couzens is a big man. He has a genius for getting things done. The wisdom of his ways may be open to question, but there is no controverting the fact that the work of building the municipal road so far constructed during his administration of affairs in Detroit has been carried out with celerity. While he is in office his best efforts will undoubtedly be devoted to the careful management of the road along sound lines. But Jim Couzens is an anachronism in American public life. When the day arrives that he goes out of office Detroit's troubles will begin in earnest. For if Detroit runs true to American political form the likelihood is very remote of that city electing as his successor a man with either his qualifications for office or his determination. It is here that danger lies ahead for Detroit.

Zone Fare Surely Hasn't Hurt San Diego Building!

ONE of the most common and plausible arguments urged against the graduated fare is the real estate man's assertion that it is a sure way toward congestion. Of course, what is worrying Mr. Realtor is that if the electric railway charges a higher fare to the long-haul riders he himself will be deprived of some unearned increment on his land. Be that as it may, San Diego is furnishing an emphatic denial of the congestion argument.

It will be recalled that on Jan. 1, 1920, the San Diego Electric Railway inaugurated a zone fare system in which a universal 5-cent fare was succeeded by a basic fare of 5 cents for either of two zones (inner and outer), while a two-zone ticket could be bought for 7½ cents. The new system was a success from the first, if judged by the fact that both revenue and riders increased appreciably.

Now comes a review of realty developments in San Diego during the first two years of the zone-fare system. According to the San Diego *Union* for March 19, 1922, the number of permits for new residences in 1920-21 was 1,285, against 242 in 1918-19, an increase of 431 per cent. The value of these new residences was placed at $3,232,069, against a value of $724,500 in 1919, a gain of 346 per cent. In January and February of 1922 activity has become even greater, January showing 131 permits for $322,900 of buildings and February 130 permits for $337,025 worth.

These are large figures for a city of 80,000 population. But what will interest the electric railway man most is that about 90 per cent of the building activity in 1920 and 1921 occurred within the outer or 7½-cent-10-cent zone, a fact which is all the more significant because San Diego is a most diffused city with more than one vacant lot at its very core. It may well be that our real estate brethren have had to sell these outer zone lots for a bit less than if they were reachable by a 5-cent fare, but the record to date surely shows that the congestion argument, so far as San Diego is concerned, is all moonshine.

The Railway Vocabulary Is Enriched

WHEN a great need develops in the industrial field, some inventor usually rises to the occasion and produces the device or machine required. It is the same with the English speech. If there is a real demand for a word or phrase to express an idea, it will be coined by some one and become a recognized part of the language. A notable instance was the word "interurban" as applied to an electric railway joining two cities.

Last week another expression was first used to describe an electric railway condition, and it promises to be so useful that it also will probably become a part of the electric railway vocabulary. The occasion was a hearing on car loading and service conditions before the New York Transit Commission, the particular point being to determine the number of passengers who had seats during certain hours and those who were obliged to stand.

In most cases of this kind, the presumption to which such testimony leads is that those who stand because they cannot find seats undergo a hardship. The management of the railway company, however, pointed out that, during a large part of the day at least, such passengers suffer no real inconvenience, because they do not have to stand for any considerable length of time. The reason for this is that so many people leave the car at each station that during the non-rush hours most passengers can secure seats after riding a few blocks.

To this class of passenger the representative of the company applied the term "rotary standees." A "rotary standee" may then be defined as a passenger who cannot find a seat the moment that he enters the car, but who within a short time will be able to seat himself in the place made vacant by a departing passenger.

Standees, in railway parlance, can therefore be classified in three ways. First, there is the standee who might be termed the compulsory standee or long distance straphanger. Next comes the rotary standee, whose status has just been defined. Finally, comes the pas-

Digitized by Google

senger who stands by preference, either because he prefers an open rear platform to a seat in the middle of a car which he may have to occupy with some disagreeable companion, or because he has baggage which he does not care to take into the car, or because he boards the "car ahead" when there is a vacant seat for him in the car behind, or for some other reason.

It is, of course, generally admitted that railways in large cities cannot supply a seat to every passenger during rush hours, and often not at other times. Even if they could afford to do so, in most cases it would be impracticable because of the impossibility of operating so many cars on the street. Where it is possible it would cost so much that it would greatly increase the average cost of a ride.

Nevertheless, the public should realize that every standee is not what might be described for the purpose of this discussion as a standee by compulsion.

Why the Increasing Interest in the Rail Car?

THERE is something about the rail car, or automotive bus with flanged steel wheels, that appeals to the imagination of the steam railroad and electric railway man. A self-reliant, self-propelling vehicle that can be set on rails anywhere and is immediately ready for business is a transportation tool not to be despised.

Of course the principal field for the rail bus is on light-traffic steam railroad lines or for supplementary local passenger service on steam lines which are primarily devoted to through freight and passenger business. Under such conditions it is necessary to operate steam-locomotive-drawn trains at very low load factor, or to stop through trains at frequent intervals to furnish necessary local service. The flexibility of the rail car adapts it well to such use. Operated in single units it insures a quality of service which will not only care for existing business cheaply but will develop new business.

Obviously the opportunity for this vehicle on steam roads is sufficient to stimulate, through competition, the perfection of its design and construction. The electric railways will profit by this, for while they, even in the aggregate, cannot use many rail cars, they can use some. In the evolution of a new interurban project rail cars might well be employed during a certain period, while traffic is building up. The same is true on roads whose traffic has lightened to an uneconomical point, or whose expected traffic has never materialized.

Granting all of this, one naturally inquires why the rail car has only recently aroused widespread interest. Steam "dummies" were of course used with some success many years ago, but were discarded in the progress of the transportation art. Why take a step apparently backward? This query ignores the fact that the automobile and the automotive bus have in the meantime taken the country by storm. More important yet is the fact that the robust and foolproof truck motor has been made available for the rail car through hard service in a closely allied field. In addition, the hard times in the transportation industry have driven home the fact that its facilities must be co-ordinated in order to move people and goods with facility and economy.

Transportation men are waking to the fact that old equipment and old methods will not pay dividends under modern conditions. Hence, once assured that the rail car is reliable and durable they will use it.

Augusta Learns a Costly Lesson

AUGUSTA has seen the error of her way. After the city had struggled along for a month without electric railway service the city officials met the company's representatives in a spirit of give and take and conceded the attitude of the company to be right, that two systems of transportation cannot exist in active competition on the same street. The lesson was available to Augusta of the dire consequences of unregulated jitney competition in Des Moines and Saginaw, but Augusta, it seems, had to learn at first hand.

From the standpoint of the city, the whole proceeding was a disgrace. The Council had been warned sufficiently in advance of the direction in which events were heading. So far as the members of that body are concerned, the charitable thing, of course, would be to conclude that the Councilmen must have been cognizant of the ultimate result of their attitude, but that they felt called upon to make a demonstration against the railway so as to placate the jitney interests. If this is so, then the city has paid a frightful price in the name of political expediency.

For the company there was nothing else left for it to do but to shut down. In resuming service it has done so apparently against its best judgment and without securing the full measure of protection against the jitneys that would appear to be warranted under the circumstances, but it has returned the cars to service in a spirit of helpfulness, hopeful that the public will respond with a measure of patronage that will permit it to continue operation uninterruptedly. The company is not against the jitney, or jitney service. Its contention all along has been against unfair competition, unfair as manifested most strikingly by the operation of two lines of transportation service on the same street. It ought not to take long to demonstrate whether the measure of regulation under which the cars have been returned in Augusta is sufficient to afford the company the degree of protection necessary for it to operate successfully in the future.

What Do You Do with a Complaint?

ONE electric railway executive who has made a conspicuous success of his interurban railroad never lets a complaint go by as inconsequental. To him every complaint is a matter of important concern. Every complaint represents evidence that the service is not as good as it could be and he takes steps to determine how the cause of that complaint can be removed. His constant endeavor is to do everything possible to cater to the comfort of the passengers. No effort or expense is spared in seeking improvements. Perhaps the worth of this way of treating complaints can be judged by the fact that in the last four years the passenger traffic on this line has increased 40 per cent, the passenger revenue 150 per cent and the freight revenue 1,000 per cent, despite the direct competition of one of the best steam railroads in the country. Of course this policy and effort in connection with complaints is only one phase of a very broad and intelligent program of developing the line and building public esteem, all of which has a bearing on the growth of the business handled. But it bespeaks the general attitude of the whole organization toward the public and the result speaks volumes as to the wisdom of the policy.

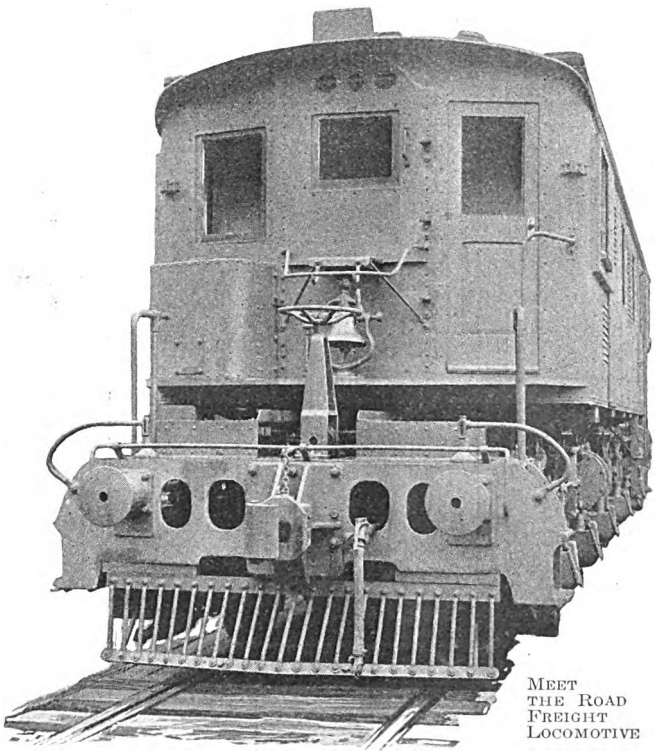
Electric Locomotives for Chile Freight Service

Details of Road and Switching Locomotives Soon to Be Delivered to Chilean State Railways Are Given —Designs Provide for Incorporation Into Present Railway System While Not Preventing Further Standardization

BY F. E. WYNNE
Manager Railway Equipment Engineering, Westinghouse Electric & Manufacturing Company

THE initial electrification program of the Chilean State Railways includes fifteen freight locomotives for road service and seven for switching service. These are in addition to the passenger locomotives, of two types, described in an article in the issue of the ELECTRIC RAILWAY JOURNAL for Feb. 25, 1922. The first ten cabs for the road freight locomotives have now been delivered by the Baldwin Locomotive Works to the Westinghouse company for the installation of the electrical and air-brake equipments. On account of the progress which is being made in the production of these machines some details regarding them will be of interest.



MEET THE ROAD FREIGHT LOCOMOTIVE

The service conditions under which the locomotives will operate were covered in articles in the issues of this paper for Dec. 3, 1921, and Jan. 28, 1922. They will be put into service on the main line between Santiago and Valparaiso, 116 miles, and on the branch line between Las Vegas and Los Andes, 28 miles. The heaviest grade is 2.25 per cent, 12 miles long against southbound traffic on the main line from Llai Llai to La Cumbre. In emergency or on holidays these locomotives may be used to operate express passenger trains.

ROAD LOCOMOTIVE SIMILAR TO THAT USED ON PAULISTA

In general design the road locomotive is similar to the freight locomotives furnished to the Paulista Railway of Brazil. The box-type cab is carried on two trucks, articulated, each having three driving axles with direct-geared motors. The estimated weight is 226,000 lb.

A low voltage will be generated on the locomotive for the control circuits, and the system of control is arranged for operation of the locomotive from either end and for multiple operation of two locomotives from any one controller. Regenerative braking also is provided.

The nominal rating of the locomotive is 1,680 hp. at 3,000 volts and the equipment is capable of developing a maximum of 3,200 hp. for short periods. With natural ventilation the locomotive will deliver a tractive effort of 27,950 lb. at a speed of 22.6 m.p.h. at 3,000 volts for one hour with a temperature of 75 deg. C. by thermometer on the main motors. The continuous capacity at 3,000 volts and with forced ventilation is 20,580 lb. tractive effort at 24.8 m.p.h. with a temperature rise of 65 deg. C. by thermometer on the main motors. With 25 per cent nominal adhesion the starting tractive effort is 56,500 lb. The maximum speed is 40 m.p.h. At loads corresponding to the short field continuous current ratings of the motors, running speeds of approximately 6.1, 8.1, 12.8, 16.6, 19.5 and 25 m.p.h. are available.

With any one pair of motors cut out, half of the locomotive capacity is available for starting and two-thirds for running.

The general dimensions and estimated weights of the locomotive are given in Table I.

The salient features of the cab and trucks and many of the details are clearly shown in the accompanying illustrations. The Chilean freight cars now use drawhooks as in European practice. However, it is planned eventually to use M.C.B. standard drawbar equipment on the entire system. Consequently, these locomotives will be equipped with Continental spring buffers and M.C.B. couplers. The couplers are arranged to take attachments for chain couplers during the transition period.

The articulation of the two six-wheel trucks at the inner ends is effected by means of a Mallet hinge. The bar-type cast-steel side frames are located outside of the wheels and are connected by cast-steel bumpers and cross-ties. The oil-tempered steel semi-elliptic driving springs over the journal boxes on each side are connected to one another by equalizing beams. The ends of each set of three driving springs connected thus are attached to the side frames through coil springs.

Rolled steel shapes extending the entire length of the cab and joined by cast-steel and rolled-steel cross members constitute the cab underframe. The cab is of the

Key to the Illustrations

No. 1—One of the Chilean road freight locomotives.

No. 2—The road freight locomotive trucks are articulated at the inner ends by a Mallet hinge and are equipped with M.C.B. couplers and spring buffers.

No. 3—Cam-operated switches are mounted on a single shaft connected through rack and pinion to a double-acting air piston.

No. 4—The motors are 280-hp. wound for 1,500 volts and insulated to operate two in series on 3,000 volts.

No. 5—Pantographs are spring-raised, air-lowered and mechanically locked in the lowered position.

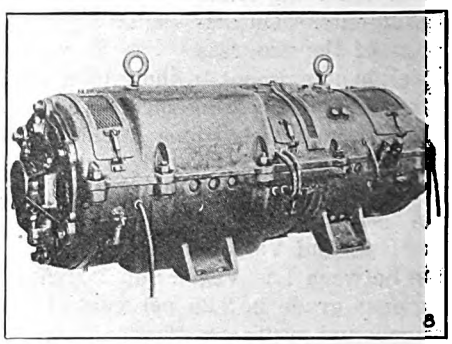
No. 6—One of the 3,000-volt unit switches.

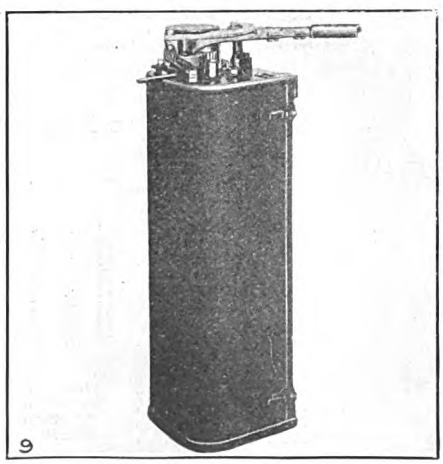
No. 7—Type of flexible gear with which freight locomotives will be equipped.

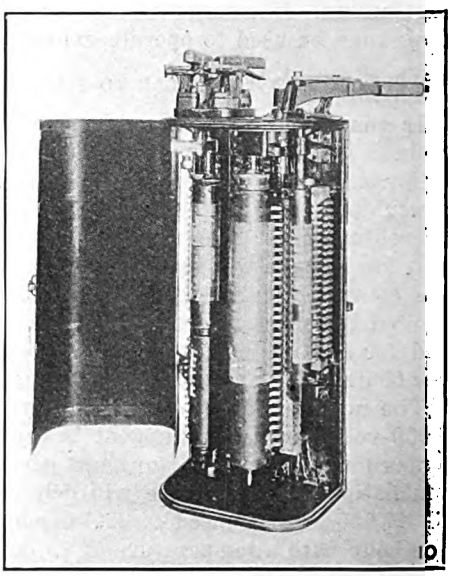
No. 8—The 35-kw. motor-generator set which furnishes low-voltage power supply on the road freight locomotives.

No. 9—The master controller for the switching locomotives has two levers.

No. 10—The master controller for the road freight locomotives has four levers.







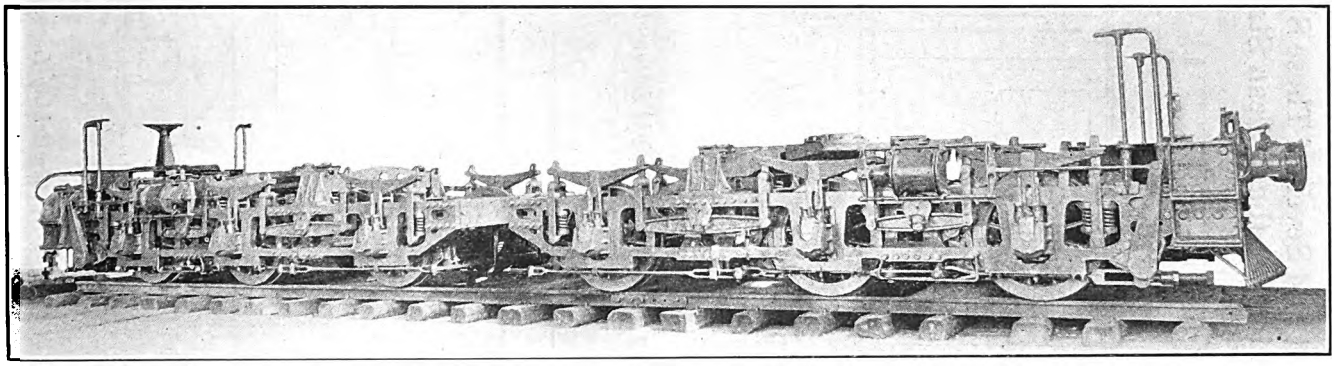
Digitized by Google

box type, 38 ft. long, and comprises an engineman's compartment in each end and a central equipment compartment. These compartments are separated by bulkheads, in which are doors at each end of each side aisle. The equipment compartment houses the blowers, motor-generator set, air compressors and most of the control equipment. The end doors are in front of the fireman's stations and there is a side door from each aisle. The usual windows, louvers and roof ventilators are provided.

The cab is carried on center pins located approximately over the midpoint of each rigid wheelbase. One center pin is restrained both longitudinally and laterally and the other in the lateral direction only. This permits longitudinal movement of the cab relative to one truck.

The locomotives are equipped with Westinghouse air brakes, which are already standard with the Chilean Railways. The air brake is of the 14-E.L. type, which provides straight air for the locomotive alone and the automatic feature for both locomotive and train. This is of advantage in that the locomotive brakes may be applied either independently of, or in conjunction with, the train brakes.

The air brake is interlocked with the regenerative brake so that the latter may be supplemented by service application of the train brakes, if desired, without applying the air brake to the locomotive drivers. In case a sudden stop is required during regeneration, movement of the brake valve to the emergency position cuts off the regenerative brake and gives an emergency application of the air brakes on both locomotive and train.



TRUCKS FOR ONE LOCOMOTIVE ASSEMBLED AT LOCOMOTIVE WORKS

The pantograph trolleys provided for collecting the current from the overhead are of the spring-raised, air-lowered type, arranged to be mechanically locked in the lowered position. Each has two flexibly mounted shoes with hard-drawn copper wearing strips which can be readily replaced. One trolley is sufficient for regular operation. For safety and to facilitate cutting out a defective pantograph, a double-throw disconnecting switch is mounted adjacent to each trolley. This switch is arranged so that in one position it connects the trolley to the main switch and in the other position it locks the trolley down and connects it to ground.

The main circuit connections are established by a number of individual air-operated switches mounted in several banks, each switch a complete and removable unit in itself. The 3,000-volt unit switch is of the same general design as that which is standard for low voltage.

For certain combination switching where no current is broken and for low-voltage circuits cam-operated switches are used. These also operate by compressed air controlled by electro-magnetic valves. The cam group comprises a number of switches mounted on a single shaft connected through a rack and pinion to a double-acting air piston. The application of air to this piston through the electro-magnetic valves rotates the camshaft, closing and opening the switches in the correct sequence. Each switch is closed by the pressure of a cam on a hardened roller and is opened by spring action. Each cam switch can be removed from its group without disturbing the other switches. These switches are without blowouts, except where they are required to open power current.

Each of the six axles of the locomotive is driven by a Westinghouse No. 350-D 1,500-volt series motor and insulated to operate two in series on 3,000 volts. The nominal rating of this motor on short field is 280 hp., at 155 amp. and 1,500 volts. Field control is secured by the use of two separate field windings on the main poles. During acceleration high starting tractive effort at low speeds is obtained with a current below normal by connecting these two main field windings in series. The full-field connection also provides an additional operating speed for each of the three motor combinations. For the higher operating speed in each combination, only one of the main field windings is effective. High continuous capacity is assured by the forced ventilation provided by two motor-driven blowers.

The motors are geared directly to the axles with a ratio of 3.94 to 1. The sixteen-tooth solid pinion of 2 diametral pitch is cut from a forged steel blank and treated. The sixty-three-tooth gear is of the flexible type, similar in general design to those which have been in successful operation on the Pennsylvania Railroad's Philadelphia terminal electrification for seven years.

For low-voltage supply to compressors, blowers, control equipment and lights a motor-generator set is installed in the locomotive. This has a single frame and the two armatures are carried by a common shaft running in two bearings. The 3,000-volt motor is a bi-polar double-commutator machine. The continuous rating of the generator is 35 kw. at 92 volts.

To provide for double-end operation of the locomotive a master controller is located in each engineman's compartment, the same one being used for both motoring and regenerative braking. This controller has four levers: a reverse lever with forward and reverse positions; a regenerative lever with thirteen notches; a motor combination lever with three positions; a speed lever with sixteen resistance notches, one full-field notch, and one short-field notch. Altogether, fifty control notches are available in acceleration so that tractive effort variations are small, thereby permitting exceedingly smooth handling of trains. All levers of the master controller are thoroughly interlocked.

By means of the Westinghouse HLFR control three

Digitized by Google

speed combinations will be obtained by varying the grouping of the motors. With all six motors in series one-third speed will result. Two parallel groups, each comprising three motors in series, give two-thirds speed. On full speed three groups, each of two motors in series, are in parallel. All motor main fields are connected next to ground, the voltage stresses on the field windings being reduced thereby. The double-field winding on the motors, giving a full-field and a short-field position for each motor combination, provides a total of six running speeds. Transition from one motor combination to another is by the shunting method.

For regenerative braking, the main motor armatures are arranged for the same combinations as when motoring, and the motor fields are separately excited by the motor-generator set. The arrangement is such that the same voltage is impressed on all field circuits. This tends to produce the same generated voltage in each series group of armatures and assures equal distribution of the load among the motors. Stabilizing resistors are used to equalize the resistances of the parallel field circuits. Both the exciting current and the generated current flow through these resistors. Any tendency of one group of armatures to generate more than its proportion of the current decreases the field current of that group and correct division of load is automatically restored. The range of speed in regenerative braking will be from 8 to 30 m.p.h.

Adequate provision for effective opening of the high-voltage circuits is secured by inserting the main resistance in the circuit prior to the final break at the line switches. This is done whenever the main motor circuit is opened, whether through manipulation of the master controller or under action of the overload relay.

TABLE II—DIMENSIONS AND WEIGHTS OF SWITCHING LOCOMOTIVES

Track gage	5 ft. 6 in.
Length over buffers	40 ft. 0 in.
Length over central cab	17 ft. 0 in.
Length over hoods	27 ft. 0 in.
Total wheelbase	27 ft. 4 in.
Rigid wheelbase	8 ft. 6 in.

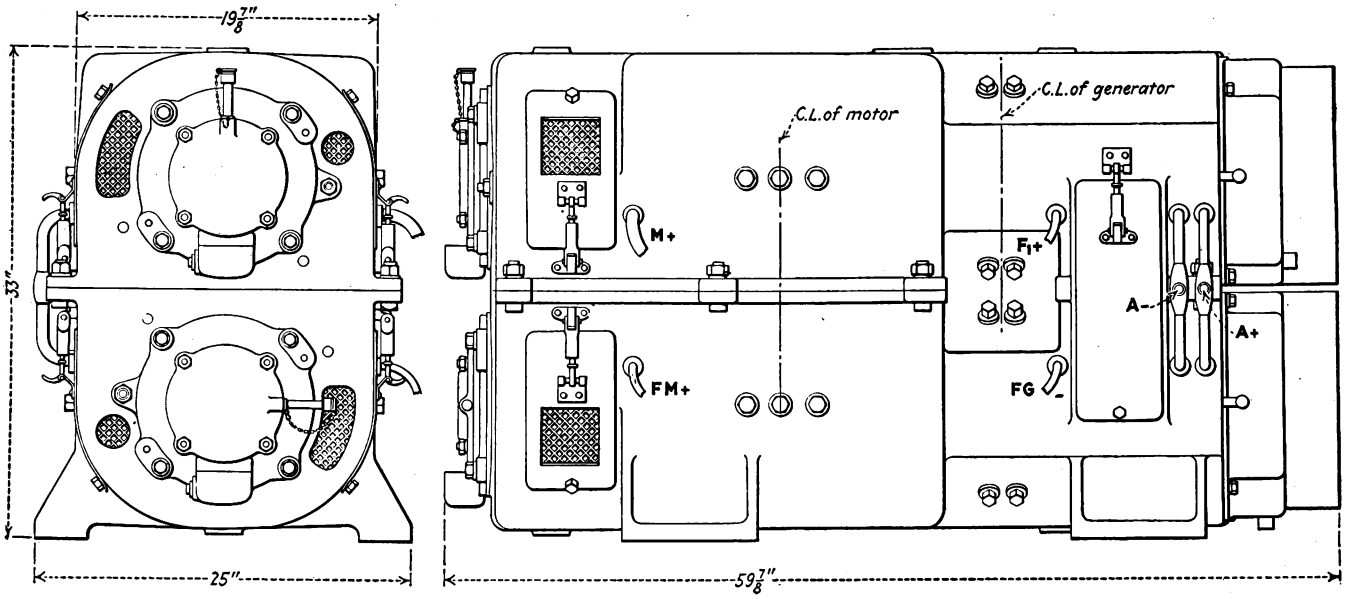
Weight of electrical equipment	50,000 lb.
Weight per driving axle	34,000 lb.



THE 22.5-KW. MOTOR-GENERATOR SET WHICH FURNISHES LOW-VOLTAGE POWER SUPPLY ON THE SWITCHING LOCOMOTIVES

SWITCHING LOCOMOTIVES ARE LARGELY STANDARD

The switching locomotive is similar in general design to Baldwin-Westinghouse standard Class D locomotives. The cab is of the steeple type and is carried on two swivel trucks. On each two-axle truck are mounted two motors driving direct through standard helical gears. The estimated weight is 136,000 lb. The control is arranged for double-end operation.

The nominal rating of the locomotive is 560 hp. With 3,000 volts at the locomotive and natural ventilation of the motors the tractive effort for one hour is 19,600 lb. at 10.6 m.p.h., and the continuous capacity is 11,400 lb. at 12.7 m.p.h. With 25 per cent nominal adhesion the starting tractive effort is 34,000 lb. The maximum speed is 35 m.p.h. For short periods the equipment is capable of developing 1,000 hp. At loads corresponding to the continuous current rating of the motors, the speed will be 5.9 m.p.h. in series and 12.7 m.p.h. in series-parallel. With one pair of motors cut out, 50 per cent of the locomotive capacity will be available for starting and for running.

Table II gives the general dimensions and estimated weights of the locomotive.

This locomotive will be capable of handling, in yards with level tracks, trains of 1,200 short tons. This capacity, though in excess of that required for serving the initial trains of 770 short tons, is desirable to provide for the expected increase in traffic.

The trucks are of the rigid-bolster equalized type with rolled steel frames located outside of the wheels. A center pin is located at approximately mid-length of each rigid wheelbase. The central cab has an engineman's stand in each end and control apparatus centrally located and suitably protected. Buffers, couplers and air-brake equipment are duplicates of those on the road locomotive.

The control equipment comprises apparatus similar to that already described for the road locomotives.

The four Westinghouse No. 350-D-2 motors are of the series type, wound for 1,500 volts. This motor has an hour rating of 140 hp., at 79 amp. and 1,500 volts. The pinions have sixteen teeth, 2 D.P., and the solid helical gears have sixty-three teeth.

Digitized by Google

The motor-generator set has a two-part frame, each part containing two bearings in which runs a common shaft carrying two armatures, one a 1,500-volt motor (insulated for operation two in series at 3,000 volts) and the other a low-voltage generator.

The motors are connected in series for 3,000-volt operation and the generators are in parallel. With 3,000 volts applied to the motors, the generators will deliver 22.5 kw. at 92 volts. The set supplies power for the compressor motor, lights and control circuits.

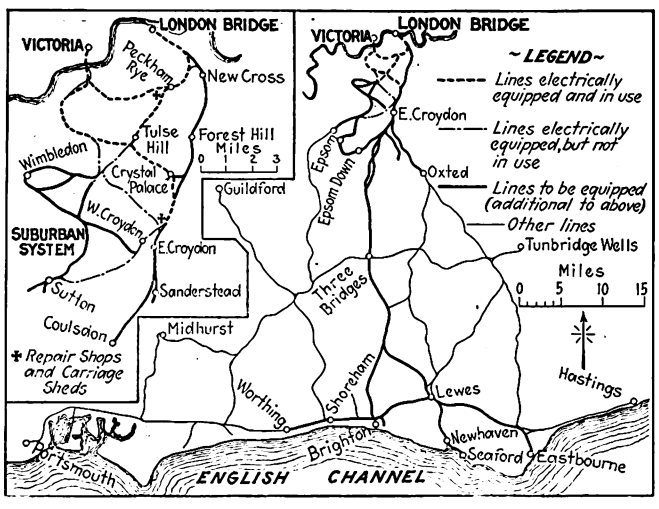
A master controller is mounted in each end of the central cab, each with a reverse lever with forward and reverse positions, and a speed lever for accelerating. A total of nineteen notches are available in operation. Shunting transition is used.

Further Electrification Promises Congestion Relief

SIR PHILIP DAWSON and the officials of the London, Brighton & South Coast Railway, England, have recently made an investigation as to the possibilities of extending electrical operation on its lines. This study,

Location	Service		Percentage Increase in London Trains	Percentage Increase in All Trains, Loaded and Empty
Victoria.....	Main Line.	Electric over steam.....	220	152
London Bridge..	Main Line.	Electric over mixed steam and electric.....	143	58
Victoria.....	Suburban..	Mixed steam and electric over pre-electric all steam	94	100
Victoria.....	Suburban..	Electric over pre-electric all steam.....	225	206
Victoria.....	Suburban..	Electric over mixed steam and electric.....	68	53
London Bridge..	Suburban..	Mixed steam and electric over pre-electric all steam	38	21
London Bridge..	Suburban..	Electric over pre-electric all steam.....	206	86
London Bridge..	Suburban..	Electric over mixed steam and electric.....	121	53

as reported in the *Electrician*, London, showed the desirability of such extension to include not only the outer London suburban area but would reach as far



PRESENT AND PROSPECTIVE ELECTRIFICATION ON LONDON, BRIGHTON & SOUTH COAST RAILWAY

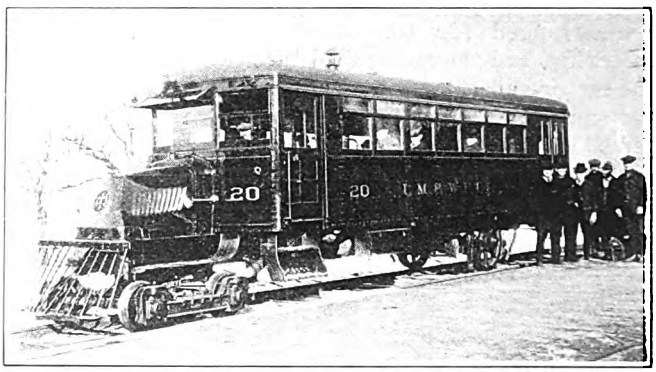
as Brighton, Eastbourne and Worthing. The plan involves the equivalent of 141 single-track miles on the single-phase system in addition to the 70 miles now in successful operation.

The accompanying table shows the estimated benefit from the electrification with respect to train-handling capacity on the congested terminal sections.

Gasoline Rail Car Operated at 40 Cents a Mile

Another Example of the Increasing Popularity of the Single Self-Propelled Unit on Steam Railroad Sections Where Traffic Is Light and Frequent Service Is Appreciated

ON JAN. 1 of this year the Lewisburg, Milton & Watsontown Passenger Railway put into operation a gasoline rail car, which is used in regular service over the tracks of the Pennsylvania Railroad between Montandon and Mifflinburg, Pa. The distance between



THIS CAR OPERATES OVER THE P. R.R. LINE BETWEEN MONTANDON AND MIFFLINBURG, PA.

these two points is 10.9 miles. The car was delivered on its own wheels over the Pennsylvania Railroad lines from Philadelphia to Milton, Pa., a distance of 167 miles.

For February and March the car-mile cost averaged 40.23 cents, but it is expected this figure will be lowered as the operating personnel becomes more familiar with maintenance of the gasoline car. The railway company gives the following cost figures, in cents per car-mile:

	Cents per Mile Feb.	March		Cents per Mile Feb.	March
Wages.....	17.79	17.43	Maintenance (labor).	0.59	0.58
Gasoline.....	5.93	5.38	Interest.....	4.39	3.88
Lubricants.....	0.64	0.72	Depreciation.....	9.14	8.08
Miscellaneous.....	3.19	2.30	Insurance.....	0.11	0.10
Maintenance (material).....	0.14	0.07	Total.....	41.92	38.54

The depreciation is figured on an eight-year basis, a first cost of $16,564.03 and an approximate life of 200,000 miles. The company operates storage-battery cars over the Montandon-Mifflinburg route, and the same force has been used to operate the rail car. Two men form the rail-car crew. The motorman runs the car and assists the conductor in handling mail, baggage and express. Overhauling and repairs are handled in the shops of the company, which employs one barn man for both gasoline and storage-battery cars.

The present schedule allows thirty-eight minutes for the run of 10.9 miles, the stops averaging about 1½ to the mile. The run is divided up into four fare zones, the fare in each being 7 cents. Railroad tickets are honored when presented, and the Pennsylvania Railroad reimburses the company for them at regular zone rates.

The car seats forty passengers, thirty-five in the passenger compartment and five in the baggage compartment. The body was built by the J. G. Brill Company, Philadelphia, and is mounted on a Mack A.C. chassis with a 22-ft. wheelbase. The car is 9 ft. 8⅝ in. wide and 27 ft. 11⅜ in. long, both over-all dimensions.

Zone Passes for Beaver Valley

The Fare per Zone on a Cash Basis Is 5 Cents, but Unlimited-Ride Service on Transferable Passes Has Been Made Available for Rides Covering One, Two or More Zones

THE Beaver Valley Traction Company, as described in the ELECTRIC RAILWAY JOURNAL for April 9, 1921, is a cross-country electric railway with a main line 9.5 miles long between College Hill and Leetsdale and several other routes. With the Pittsburgh & Beaver Railway, there are 26 miles of route. The population of the entire district is about 64,000 and of the largest community, Beaver Falls, 13,000.

In pre-war days this railway was on a 5-cent zone basis with zones up to 6 miles. The first fare changes were to 6 and 7 cents respectively with no change in the lengths of zones. As these higher fares did not produce the necessary increases in revenue and also cut down the number of customers, the company returned to a basic fare of 5 cents per zone, but the length of zone was cut to an average of 2 miles. This kept the fare within the limits of the towns served to 5 cents.

The 5-cent, short-zone plan proved the best plan tried up to that time, but unluckily soon thereafter came the depression, which hit the Beaver Valley so hard that traffic for eleven months ended Nov. 30 compared with eleven months of 1920 showed a loss of 18 per cent despite 10 per cent more service and no increase in fare. In these circumstances, W. H. Boyce, general manager of the railway companies, decided to sound the public before making any further changes in fares or service.

To this end, he sent out copies of the accompanying questionnaire to the larger employers of labor in the district for distribution among their people. The answers to these questionnaires showed where a large proportion of the employees lived, where they were employed, where they boarded the car, whether they owned or made use of fellow workers' automobiles, what they thought of the trolley service and whether they would be likely to buy a transferable, unlimited-ride weekly pass.

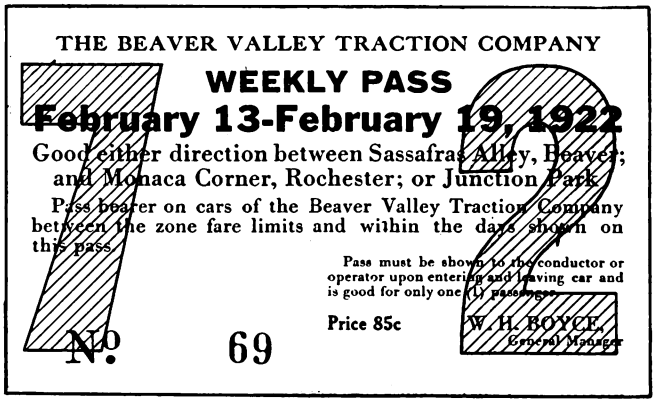
Disregarding, for the present article, the questions and answers relating to cars and service, the poll on the fare queries brought out the fact that (a) some people rode to work but not from work; (b) few rode home to lunch but would do so if the fares were lower; (c) some had stopped using the cars although comparatively few had automobiles or used the machines of their friends; (d) people who happened to live rather close to a zone boundary protested against the 10 or 15-cent fares which they had to pay for comparatively short rides each day.

Of course, the fact that the answers showed the writer's place of employment and of residence made it possible to judge whether he really was a good prospect for unlimited rides a day at more advantageous rates of fare.

After the information from this questionnaire had been compiled, the company printed a little folder of acknowledgment and explanation which it distributed to passengers through boxes in the cars. It took up the principal points of which complaint had been made and offered a few words of explanation about them. Thus, to the criticism that fares were high, the circular pointed out that it is impossible at this time to reduce the charge per ride except when rides are purchased by the wholesale, as by a weekly pass. Complaints that the safety car was not desirable were answered by the statement that it was a modern car, more than 5,000 of them being in operation in the United States and that it was a means of keeping the railway service going in a great many communities or of giving a more frequent service. Reasons beyond the control of the company for car delays were given, and passengers were urged to investigate the advantages of the pass.

ZONE-FARE TICKET MACHINE HELPS GREATLY IN TRAFFIC ANALYSIS

As explained, when the zone system of fare collection was begun the plan followed was to collect a new fare at each zone boundary. Upon the introduction of one-man safety cars on the Beaver Valley main line—which has seven active zones throughout the year and eight in summer—the company installed the Shanklin machine



A TWO-ZONE WEEKLY PASS

for issuing zone-fare receipts, as described in the ELECTRIC RAILWAY JOURNAL for Nov. 26, 1921. The records from this machine were of the greatest value in working out fare alterations because they show for any desired run, day or week, the origin and destination of every passenger.

For example, the analysis of Route 2001, the main line, for Friday, Dec. 16, 1921, showed:

3,933 passengers rode within one zone
1,348 passengers rode within two zones
217 passengers rode within three zones
78 passengers rode within four zones
96 passengers rode within five zones
102 passengers rode within six zones
4 passengers rode within seven zones

These figures alone indicated that it was hardly worth while to get out a special form of transportation ticket for any ride exceeding three zones, even if that class of traffic would be doubled thereby. In addition, the Shanklin records also permitted the separate classification of each set of zone passengers, the one-zone riders on Route 2001 varying from 1,519 to 86 in number, according to the location of the zone. This gave a clue to the further elimination of special transportation.

An analysis was also made of the steam railroad

PLEASE FILL THIS OUT

If you want a lower street car fare please fill out this blank, answering each question, as it is material to us in making a survey of the conditions. Your filling out this blank may result in our adopting a ticket method by which you will feel justified in using the street cars more frequently

By what plant are you employed? _____
(Give name and location by street and No.)

What is your name? _____

What is your house number? _____ On what street do you live? _____

_____ In what town? _____

Do you ride the cars to your work? _____

Where do you board the car going to work? _____

At what time of day? _____

Do you ride home from work? _____

Where do you board the car? _____

At what time of day? _____

Do you now ride home to lunch? _____

Would you ride home to lunch if the fare is reduced ? _____

About how much do you spend for all of your street car fares, per week? _____

Do you own an automobile? _____

Do you use it to go to and from your work? _____

Do you carry other workmen with you? _____

What is there about our service that is not satisfactory to you? _____

_____

_____

If we sold a pass for a certain amount that would permit you or any member of your family to ride as frequently as you might wish, would you be likely to buy such a pass each week ? _____

With the question of a reduced fare for the worker to be considered, won't you help us reach a decision by filling out this card ?

We thank you.
THE BEAVER VALLEY TRACTION COMPANY
and
THE MANAGEMENT OF THIS PLANT

SETS OF THIS QUESTIONNAIRE WERE SENT OUT TO EMPLOYERS FOR DISTRIBUTION AMONG THEIR EMPLOYEES

commutation service and rates in this territory with a view to seeing if any of it could be transferred to the electric railway. It was found, however, that the bulk of this business is done during the rush hours and is handled at such low rates that they could not be met by the electric railway. For the runs exceeding three electric railway zones, also, the steam railroads offer a big advantage in speed to all who live reasonably near the stations.

A VARIETY OF ZONE PASSES ADOPTED

As the result of these several studies, the company decided to install an adaptation by Walter Jackson of the unlimited ride pass first suggested by him for Racine, Wis., and since installed at Kenosha, Youngstown and Fort Wayne (Feb. 28, 1922). Actually, the Beaver Valley passes as inaugurated on Feb. 13, 1922, strongly resembled the station-to-station season ticket of the London Underground Railways, since instead of being universally valid over all parts of the railway they could be used only between the points shown on the pass. This naturally made the pass less attractive because it may not meet the social or amusement direction of travel desired by the same person who finds it handy for his home-job riding. To meet this condition, the $2 three-zone pass is now good for unlimited riding in either direction.

The number of passes originally installed was twenty, made up of:

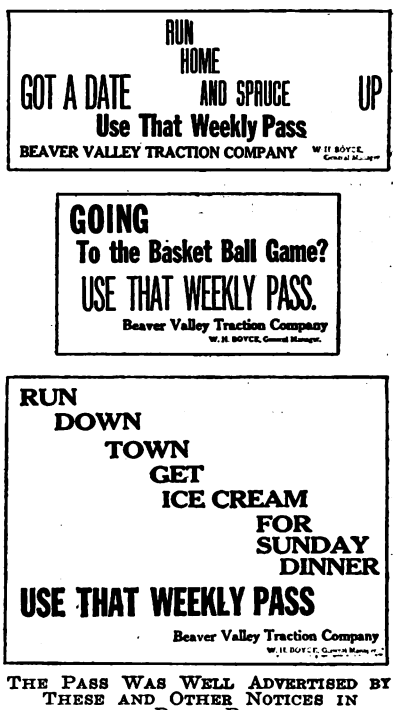
1 school pass	$0.75 per week
11 one-zone passes	$0.85 per week
6 two-zone passes	$1.60 per week
2 three-zone passes	$2.00 per week

The experience of the first four weeks showed that in some cases the number of passes sold of a given kind did not make it worth while to print so many varieties. The company is prepared, however, to sell from its office any combination on demand. For these rarer styles, a rubber stamp for zone identifications will answer. The revenue from the sale of passes has increased from week to week. The whole plan is simply an effort to promote good will, and give the public every possible opportunity to make more use of the company's facilities.

The pass procedure is very simple. On boarding or leaving either a one-man or two-man car, the passholder shows his pass, which bears the zone designations in either numerical or letter form, according to the route. On leaving, he shows it again. The figure "7," in the cut on page 673, is simply for the seventh week of the year. In addition to the zone designations (single or combination), the card carries the names of the boundaries. It will be understood that a passholder can ride beyond the boundaries shown on his pass merely by paying for the excess zones in cash via the locked farebox.

Of course, the ideal scheme would be to sell passes good for one, two or more zones on any part of the line, but this would involve so much checking that it would be impracticable on a one-man car. With the present plan, there is absolutely no addition to the work of the operator. In fact, his work is reduced because every pass ride means one fare transaction and receipt issuance less.

Because of the double visé of the pass, it is not necessary to change the colors frequently or to use different colors for different zones. The small number of each kind required also demands simplicity from the standpoint of the printer's bill. Mr. Boyce has solved the problem of pass cost neatly enough by selling the space on the back to the local lighting company at a figure that eliminates this factor. A word or two is in order on the principle used in fixing the prices of the passes. That of the one-zone pass is 85 cents, which is equivalent to seventeen rides a week or practically three rides a day. In such small communities as are served by this company, a pass-holder can readily average four rides a day by making it his business to go home to lunch or ride instead of walk in the evening or on holidays. Thus, he gets his two off-peak rides at half price.



THE PASS WAS WELL ADVERTISED BY THESE AND OTHER NOTICES IN THE DAILY PAPERS

The price of the two-zone pass was set at $1.60, which is equal to sixteen 10-cent rides a week. The concession is slightly greater because of the greater revenue paid per trip and because a two-zone rider will be likely to average fewer extra rides outside of the "home-job" trips. The cost of the universal pass is $2 or the cost of thirteen and one-third rides, since this class is likely

Street Car Fares Way Down Now

Ride on a Weekly Pass

All the Riding You Want for a Solid Week at About What You Spend Now

1 Zone $0.85.....for a Weekly Pass
2 Zones $1.60.....for a Weekly Pass
3 Zones $2.00.....for a Weekly Pass

A Hundred Rides for Two Dollars
They Now Cost You Fifteen Dollars

We can make this enormous reduction when we are assured of so many rides each week. A certain volume of Pass sales will remove the uncertainty from our business. You are to profit by this.

If You Want This Reduced Fare Buy Your Weekly Pass Now and Buy One Each Week

The pass is probably the only way by which we will be able to reduce the present fare within a period of several years.

We Believe You Should Have Some Reduction in Fare

We want to bring down the cost of living. We believe the wholesale purchaser of rides should have some reduction in fare. After months of study, in which we were assisted by many local manufacturers and their employees, and the most prominent fare expert in this country, Mr. Walter Jackson, of New York, we have decided on the adoption of the Weekly Pass. Our receipts are running 22% behind last year's, but still we can't close down and wait for business to pick up. We are going out after business even with this enormous reduction in rate.

We Want You to Know that We Want Your Business

It is essential to your own prosperity that the transportation lines of your community prosper. Suppose we shut down two weeks or three to six months every year? What kind of a community would this be?

Do You Appreciate that We Never Shut Down?

That always, day and night, the loyal street cars are at your service? Good times and slack times, rain, snow, fog, in cold or hot weather, always ready to take you anywhere on our lines. If you appreciate it

Buy Your Pass On Sale Now by all Conductors

Buy a Weekly Pass
Ride as Often as You Can

BEAVER VALLEY TRACTION COMPANY
W. H. BOYCE, GENERAL MANAGER.

Buy Your Pass On Sale Now by all Conductors.

WHY REGULAR RIDERS SHOULD BUY THE PASS

to take still fewer excess rides; nor will many steam railroad commuters be likely to change over.

Although the number of passes in use was twenty, the number of applications was greater, inasmuch as some of the passes are good between specified points on either the main line or the Riverview line (Route 2005). This arrangement also gives the passholder a more liberal use of his transportation than otherwise. No attempt has been made to record the number of rides taken on each kind of pass, but each kind could be recorded in turn purely as a matter of curiosity, if desired.

NO MEANS OF PUBLICITY LEFT UNTRIED

Mr. Boyce is known as one of the country's strongest believers in, and practitioners of, publicity. An inspection of the window cards, dasher placards and newspaper advertising would reveal that he reveled in the opportunity for good will offered by the unlimited-ride pass. The newspaper advertisements, in particular, display his direct, candid way with present and prospective customers. Among the varieties of copy used was the curiosity type, as in the one headed "Coming .....WE---- PA--....What Is It?"; the personal style, as in the one reading "Got a Date? Run Home and Spruce Up. Use that Weekly Pass"; the timely variety, as "Going to the Basket Ball Game?" and a "Go" advertisement urging some of the many uses as: To work, to bowl, to see "honey-bunch," to church, to school, to visit the well, to visit the sick, to the lodge, to the club, etc.

Both the problem of selling the pass and of advertising its uses are complicated by the fact that the shoestring layout of the Beaver Valley system demands a variety of passes. For this reason, one cannot expect at any time the same high range of percentages of sales and use possible with a universal city pass. The fact that the base fare is the convenient nickel also tends to restrict pass sales in comparison with systems with higher and more cumbersome rates of fare.

Wages Lag in Living Cost and Price Declines

ANALYSIS of changes in wages and commodity prices and in living costs throughout the United States from 1914 to 1921, made by the J. L. Jacobs Company, engineers, Chicago, shows that wage increases ran ahead of living costs in 1918, and that at the peak early in 1920 average wages had increased approximately 134 per cent over 1913, while the cost of living increase for the same period was about 116 per cent. Since then both living costs and commodity prices have declined much more rapidly than the wages of employed industrial workers. Digests of wage changes during 1921, made by this organization, cover reports from 1,026 establishments and industrial groups in practically every key industry in the country and show average wage reductions during the year 1921 of 16.1 per cent for over 5,000,000 workers.

Data from the 1026 establishments and industries show that approximately 4.7 per cent report reduced wages 30 per cent or over, 8.6 per cent reduced wages between 25 per cent and 30 per cent, 24.2 per cent reduced wages between 20 per cent and 24 per cent, 18.2 per cent reduced wages between 15 per cent and 19 per cent, 34.1 per cent reduced wages between 10 per cent and 14 per cent, and the balance of 10.2 per cent made wage reductions of less than 10 per cent.

Classified according to industries, the data show the largest reduction in the meat packing industry. There the average reduction has been 25.5 per cent for the 200,000 workers in that industry. The reductions then taper off to 14.8 per cent for approximately 140,000 street railway and other utility employees in 161 cities, approximately 12½ per cent reductions for railroad and express employees and an average 16.4 per cent reduction for over 866,000 employees in miscellaneous establishments and industries.

Among the public utilities, wage reductions reported show that of the 161 organizations thirty-five reduced wages 5 per cent to 9 per cent, fifty-seven reported reductions of from 10 per cent to 14 per cent, thirty-one from 15 per cent to 19 per cent, twenty-six from 20 per cent to 24 per cent and twelve reduced wages over 25 per cent. Some of the larger street railways reporting reductions were in the cities of New York, Philadelphia, Brooklyn, Boston, San Francisco, Detroit, Cleveland, Pittsburgh, Denver, Los Angeles, Seattle, Albany, Indianapolis, Buffalo, Milwaukee, Omaha, Topeka, Council Bluffs, Salt Lake City, Mobile, Ala.; Fort Wayne, Syracuse, N. Y., and Newark, N. J.

Control Equipments for the Frankford Elevated

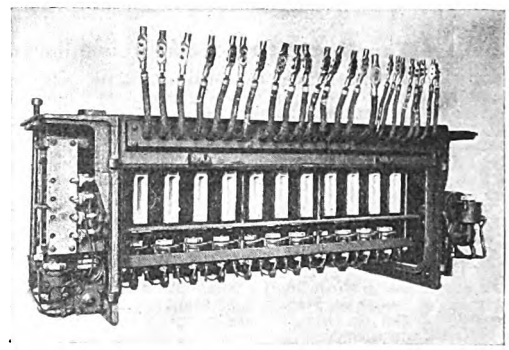
Electro-pneumatic, Battery Operated Unit Switch Control with Many Special Features Was Chosen —Interchangeability with Existing Equipments of Market Street Lines Can Be Had with Few Changes

THE control equipments for the cars for the Frankford Elevated line in Philadelphia will include all features necessary for extending subway as well as elevated service. The use of storage batteries insures an uninterrupted supply of energy for the motor control, the emergency lights, door engines, signals and other devices necessary for efficient and safe operation in underground service. With the motor control fed by a storage battery, the train may be stopped in an emergency by reversing the motors regardless of the availability of line voltage. Also the source of control energy not being dependent on the power available on the head car of a train makes it unnecessary for the motorman to operate the train from the second or third car when the main power fuses are blown on the head car, thus eliminating one source of delay encountered in elevated service where battery control is not used.

Another consideration in which battery control has apparent advantages is in regard to reliability of regular operation. This is insured, since the comparative low voltage of the storage battery practically eliminates control failures due to insulation breakdowns, and the low voltage is not dangerous to life.

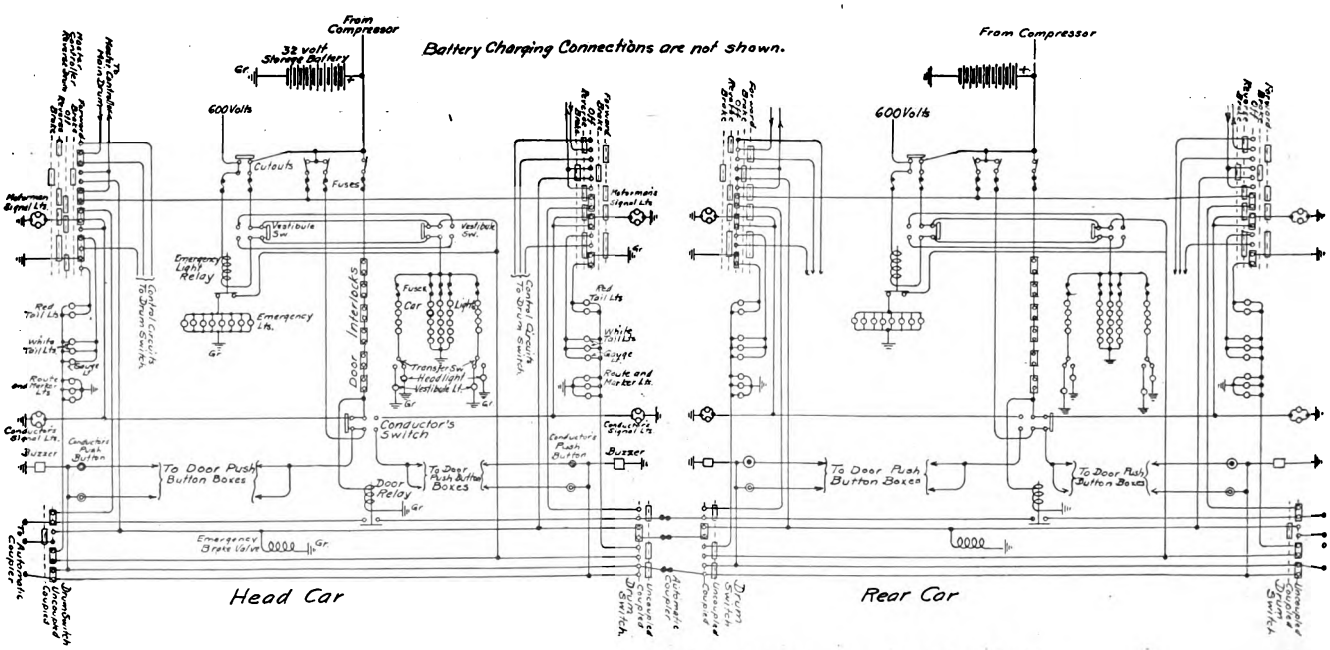
The unit-switch control equipment includes twelve Westinghouse electro-pneumatic unit switches of the HL type for effecting the principal changes in the main motor circuits, and also for overload protection. Eleven of the switches are grouped together into a main switch group, on the ends of which are mounted the drum-type motor reverser and the control sequence drum. In addition to the main switch group, another similar unit switch is mounted in a separate frame, with the arc chute venting to atmosphere. This unit serves as a line switch, opening on overload as well as interrupting the circuit under normal conditions. On the ends of the line switch are mounted the overload trip relay, line switch operating relay and the notching relay.

Automatic acceleration is accomplished by a current limit relay governing the movement of the sequence drum and thus energizing the unit switch magnet valve coils in a certain definite sequence. For the specific manipulation of the main circuits during acceleration, six steps are provided with the motors connected in series, four steps with the motors connected in parallel, and the closed circuit or bridging transition between the series and parallel connections. The normal or tapped field connection of the motors is effective on the last full parallel running step.



SWITCH GROUP—REVERSER AT END

The grouping of the unit switches, with their supplementary control apparatus, into two boxes gives an assembly which is compact, yet fully accessible for maintenance or inspection purposes. The use of separate electro-pneumatic unit switches for all main circuit switching provides accurate means for control of the acceleration in trains. The compressed air required



SCHEMATIC DIAGRAM OF LIGHT AND SIGNAL CIRCUITS FOR A TWO-CAR TRAIN

Digitized by Google

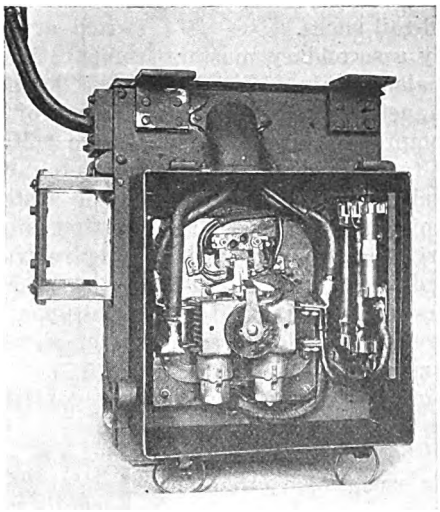
for operating the switches is taken from the common air brake supply through a reducing valve to give a normal pressure of 70 lb. per square inch.

Control power for operating the electro-pneumatic apparatus is taken from the 32-volt storage battery that is charged in series with the compressor motor. A train line circuit connects in parallel the positive poles of all batteries of a train and the control power is led from this common train line connection to a master controller at each end of the car. The master controller is provided with two handles, a main accelerating handle permanently attached to the controller and a removable reverse handle for controlling the direction of car movement. The two handles are mutually interlocked so that the main handle cannot be moved unless the reverse handle is in one or the other operating position. The movement of the reverse handle energizes the master controller drum from the control circuit supply and establishes circuits for the "Dead-man's" operation of the brakes and for the signal and marker light circuits. The emergency or "dead man's" application of the brakes from the master controller is secured both electrically and pneumatically. The main handle of the master controller has an upward movement whenever the motorman's hand is removed. This releases the fingers on the upper positions of the reverse drum and closes the circuit to the emergency wire of the air brake system. The same upward movement of the handle releases a small air valve in the top of the controller which operates a secondary relay valve that exhausts air from the brake pipe of the train.

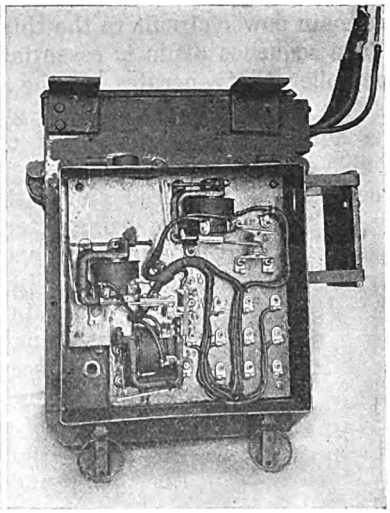
From the master controller, the control power is led to a train line from which the circuits are taken to the various unit switches and allied operating devices. Provision is made for cutting out of service any defective car in a train by means of a small drum type control cutout switch mounted on the panel board at one end of the car and connected in the circuits to the control apparatus. The train line runs to automatic electric couplers attached to the drawbars of the car. The train line contacts on the face of the coupler are energized through a separate drum switch which is operated when the cars are coupled in train to connect both air and electric train lines. Ten of the eighteen train line circuits in the coupler are utilized for motor control purposes, five for the electro-pneumatic air brake circuits, two for signals and one as an extra for any future extensions to the auxiliary circuits.

Protection for the control equipment is provided by the main and third rail fuses in conjunction with the overload trip relay and the high speed-line switch. The line switch opens at an extremely high speed in response to the overload relay, or due to a sudden drop in line voltage, which usually accompanies the sudden and very severe momentary loads that occur on third rail systems. A high-voltage surge usually follows immediately after the sudden voltage drop and the high speed of the line switch enables it to open quickly so as to protect the motors against the voltage peak. Operating the high-speed line switch by trolley voltage insures positive opening on the momentary interruptions of power when the train is passing at high speed over gaps in the third rail. In this way, the power circuits are opened locally on each car after passing each gap and the control operates automatically just as when starting the car, thus preventing flashing of the motors and surging of the cars in the train.

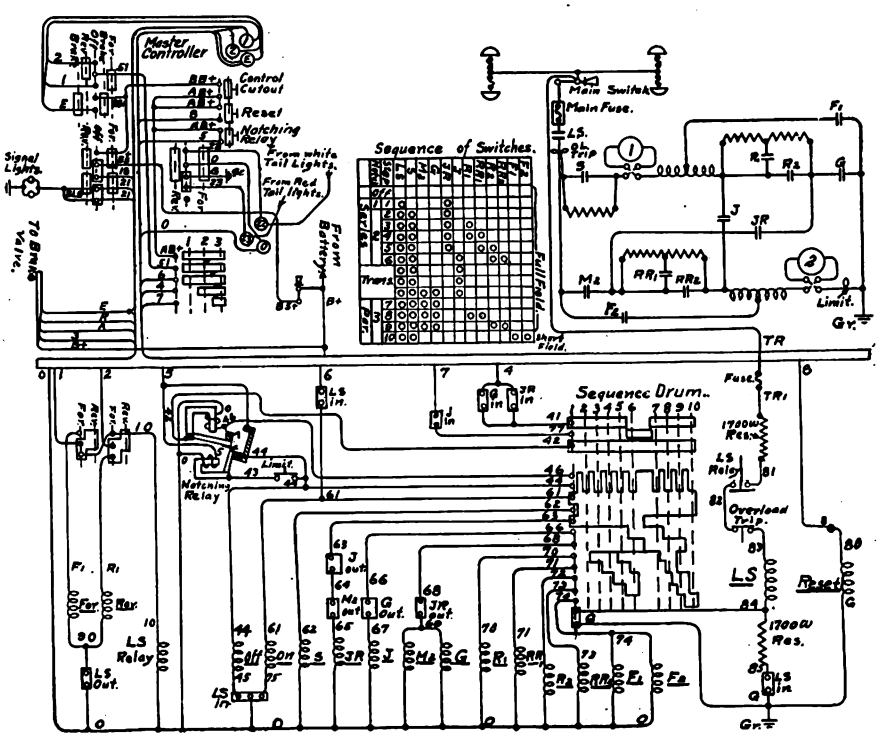
The overload trip relay has two operating coils, each connected in the circuit to one of the motors. The relay operates at the same overhead current value per motor with the motors in either the series or the parallel combination, thus allowing closer adjustment and better overload protection than would be obtained if a relay



OVERLOAD TRIP RELAY OF LINE SWITCH



NOTCHING AND OPERATING RELAYS OF LINE SWITCH

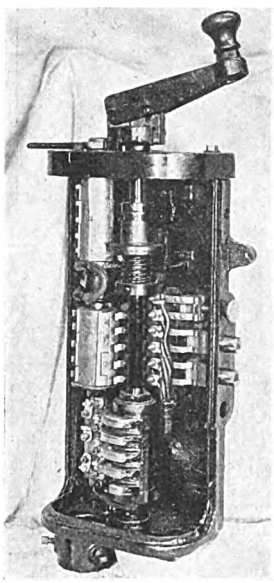


SCHEMATIC CONTROL DIAGRAM OF FRANKFORD ELEVATED CARS

Digitized by Google

with a single operating coil were used and connected in the main power circuit to the third-rail shoes.

The sequence drum is essentially a secondary master controller that operates on the balanced-air principle, having the usual on and off magnets for regulating the admission and release of compressed air to the double-end piston which is geared to the contact drum. The drum is advanced automatically, notch by notch, by the "off" cylinder, being intermittently charged and discharged by the limit relay energizing or de-energizing the "off" magnet circuit. In addition, the sequence drum, in combination with the notching relay, provides means for securing non-automatic notching of the control independent of the limit relay. This operation becomes necessary only under exceptional circumstances, such as accelerating a train after it has stopped on the grade when coming from the subway to the elevated structure, or in a two-car train when one car has been cut out of service.



MASTER CONTROLLER

The notching relay is mounted on the line switch. It comprises essentially two relays mounted at right angles with the contacts interconnected so that notch-by-notch operation can be obtained when desired by intermittently energizing one of the relay coils from a push button located at the side of the master controller. The other relay coil is connected to the limit and sequence drum circuits so as to be energized each time the sequence drum advances a notch, which insures that the drum will pause momentarily on each notch during automatic acceleration.

There are eight tail lights per car, located in groups of two beneath the window rails at each end of the car. One of the 20-watt lamps of each pair is provided with a white lens, the other with a red lens. The interlocking in the master controller and drum switches is such that when the cars are coupled, the lights are automatically disconnected at the coupled ends, but the white lights show at the head end of the train where the master controller reverse drum has been operated, and the red lights show at the rear end of the train. The marker and route indicator lights on the ends of the car are also arranged to be lighted only at the head and rear of the train. This arrangement reduces the drain on the battery to a minimum, and also insures that the proper lamps are always lighted without special attention on the part of the train crew.

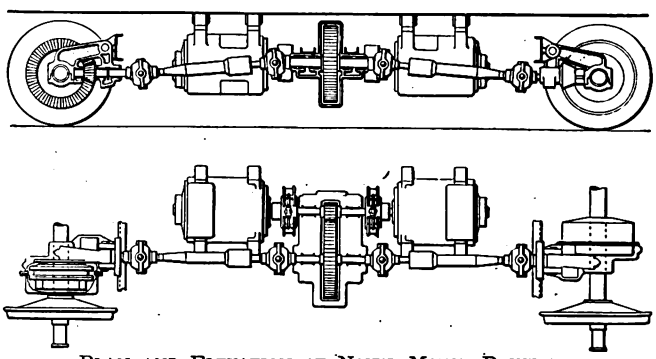
The motorman's and conductor's signal lamps are located at each end of the car in plain view of the motorman inside the car and the conductor outside between the cars. The lamps at the conductors' station between cars burn when the doors of the adjacent cars are closed, and at the motorman's station when all the doors are closed throughout the train. This selection of circuits is made by means of a conductor's switch and a relay on each car connected in series with the door interlocks on the car. The relay contacts throughout the train are connected in series by a train line circuit, which receives its energy through the master controller reverse drum and coupler drum switch at the rear of the train. This scheme places comparatively few interlock contacts in series throughout a long train, thus reducing to a minimum the chances of signal failure from open circuit or excessive voltage drop. In case a door cannot be closed completely, thus preventing light signal indications, the buzzer system insures that the motorman receives the starting signal. The buzzers are used at all times, being relayed from conductor to conductor, beginning at the rear of the train. The motorman starts the train upon receiving either the light signal or the buzzer signal.

Differential Drive Radial Truck in Germany

THE Dortmund Street Railway Company has recently put in operation an experimental single-truck car with differential drive. The truck is of the radial type, and the drive somewhat similar to that on an automobile except that both axles are driven through separate differential shafts from twin motors in the center of the truck. The mechanical portions of the truck and driving mechanism were supplied by F. Krupp & Company of Essen, and the rest of the equipment by Brown, Boveri & Company. The car was put in operation in June, 1921, and according to *Verkehrstechnik* has run nearly 4,000 miles without failure.

The accompanying drawing shows plan and elevation of the system of motor suspension and motor drive. The truck has a wheelbase slightly over 13 ft. Owing to the nature of the drive, the axles can take a radial position when the car is passing around a curve, and no difficulty has been experienced in driving this car at a speed of 22 m.p.h. around a curve of 70-ft. radius.

The motors are attached to the car underframe, the



PLAN AND ELEVATION OF NOVEL MOTOR DRIVE FOR SINGLE-TRUCK CAR

flexibility between the motors and the axles being secured by two universal joints in the driving shaft. The gage is only 1 m. (3.2808 ft.). The radial arrangement would permit the car to pass easily around a curve with a radius of 50 ft. and still keep the wheelbase at 13 ft. Usually with a single-truck car and a gage of 1 m. it is not practicable to have the wheelbase more than 10 ft., and even this is productive of much grinding at the curves.

United States Commerce Reports have been rearranged and are now classified by commodities and geographically with special sections devoted to transportation, tariff, commercial law and similar subjects. The information is received direct from over 600 representatives of the United States Government in the world's industrial and commercial centers.

Letters to the Editors

An Appeal for a Square Deal for Electric Railways in New York

NEW YORK, N. Y., April 10, 1922

To the Editors:

Civilization is something the world has fought countless centuries to achieve. Men relish it today and struggle for its maintenance because they have come to realize that it not only is the cheapest but also the easiest way to live. Next to peace of mind what they most long for is physical comfort.

To obtain physical comfort a man pays three times the rent that he needs to pay in order to domicile himself in an apartment with elevator service. For the same reason he hires a taxicab to take him a distance that he could easily walk or, if he is a man of means, he rides to his office mornings in his limousine when the subway, the elevated lines or a bus would take him there more expeditiously.

It is because of the physical comfort that it gives, with its rule that every passenger shall have a seat and there shall be no crowding, that the service of the Fifth Avenue Coach Company has become so popular. It is, in fact, the Pullman service of city transportation, and the waiting crowds along its various routes demonstrate the willingness of the people of New York to pay a reasonable price for a service which is distinctive and which assures physical convenience and comfort.

Americans are the hardest workers in the world. That is why America leads all countries in the conveniences, comforts and luxuries that it offers its people. It is bred in the bone of Americans to pay unhesitatingly for service well rendered. Briefly, such service means the efficient, proficient supplying of the conveniences of life at a cost economically sound and just.

Among all modern conveniences what is more essential today than transportation? America was the first great nation of the world firmly to weld itself together by land transportation. And for the comforts and conveniences that its great transportation systems offer its people have always been willing to pay a fair price. No American seeks something for nothing. Few Americans are blind to the fact that great aggregations of capital which have been made to render public service are entitled to a fair earning power.

We have heard much, through the press and otherwise, of what has been termed the "disgraceful overcrowding and congestion of present transit facilities." Yet here in New York, a city which enjoys the most wonderful and safest transportation system the world has ever known, there is continued insistence that a service shall be rendered at a price which represents an actual loss to those furnishing it. No other service, public or private, is demanded on such terms by our people. Fair and square in everything else, they obstinately insist on what has come to be known as "the 5-cent fare." Their attitude is so untrue to the real American spirit of square dealing that it is difficult to understand.

For the first time in our history we find our people demanding something for which they are unwilling to pay a fair price. Not only are they forcing the transportation companies to economies which necessarily reflect themselves in the service given, but they are choking off the development of our subway systems, and frightening capital away from traction investments which must be made by private citizens if our rapidly growing transportation needs are to be met.

It is time for New Yorkers to think these things over, to close their ears to the wailings of the agitators and demagogues who have made our transportation system a football for their private political ambitions, and to approach the matter in the true American spirit, as other cities have done.

This, in a word, calls for the square deal; a fair price for an honest service rendered, no more, no less.

What has become of the hard common sense, as well as the sense of fair play, of the New Yorker of bygone days?

M. A. SCREEBER.

*Standardized Methods of Employment**

BUREAU OF PERSONNEL RESEARCH
CARNEGIE INSTITUTE OF TECHNOLOGY

PITTSBURGH, PA., April 3, 1922.

To the Editors:

I have been interested to note that electric railway men are showing increasing interest in the scientific selection of men for their services. The interest in vocational selection methods generally is rapidly increasing. Evidence of careful study of means of improving the quality of employees comes from every direction. The question of getting the best men and women available is not limited to employees, as that term is usually understood, but extends to the need for better minor and major executives. All of us have realized the importance of the problems connected with obtaining satisfactory employees, but until the last few years we have been helpless in the face of the complexities involved. That electric railways are also interested in better selection is only evidence that they too wish to be in the forefront of this new movement.

My own belief is that the increasing importance attached to selection is being brought about by the rapidly developing appreciation of the business value of good will and satisfaction. "The public be damned" policy, or caustic criticism of the individual employee or of the transportation system in general, is giving way before constructive suggestions from public-spirited men, before the selection of "boosters" as employees and before carefully planned instructions on how the public can make the transportation system more efficient. One passenger crosswise in a car either in temper or actual position; one tired, cross platform man, can do more to destroy efficient service and satisfied patrons than a whole fleet of trucks stalled on the tracks. The adjustment of the human element is of utmost importance.

For these reasons I wish to commend the ELECTRIC RAILWAY JOURNAL for opening its pages to a discussion of the problems of selection as applied to platform men. I have read with interest the discussion of the report of a committee of the American Electric Railway Transportation & Traffic Association on this subject, and I have also enjoyed reading Dr. Gradenwitz's interesting

*The author of this letter was one of the compilers of the "Army Mental Tests" referred to in the discussion on personnel and training of transportation department employees at the 1921 Atlantic City convention of the T. & T. Association. As major in the army, he had much to do with personnel work during the war.—EDITORS.

Digitized by Google

article in the Jan. 28 issue and Dr. John Leeming's article in the March 11 issue of the JOURNAL. Both writers have done an important and suggestive service; one in calling attention to the great need for carefully planned testing procedures, the other in emphasizing the inadequacy of the usual medical, neurological and physical examinations.

WHAT RECORDS SHOULD BE KEPT

There are certain points that, to my mind, should be more fully emphasized in the discussion of a selection program. An extremely important consideration is the matter of records. It should be impressed upon every official of every company that no question and no test applied to a prospective applicant is so unimportant that it can go unrecorded. In the first place the application of such a principle will eliminate much that is useless or disregarded in the interview and in the routine of the employment office. The only exception to the principle that occurs to me now is the introductory conversation that aims to set the applicant at ease before the beginning of the formal interview or test series. Even this should be carefully standardized. But a more important reason for careful observance of this point lies in the need for detailed records of the medical, physical, mental, emotional and social characteristics of the applicant. Unless the routine of record keeping is regularly maintained we shall never satisfactorily establish the value of any preliminary examination. Dr. Leeming has successfully shown the importance of the medical records in several specific instances. A like importance will finally attach to the other records if properly kept.

All of us have seen personnel men, employment managers, welfare workers and even plant physicians dismissed in the last few years. One reason, among others, has been the failure of these employees to demonstrate the importance of their work. They have relied too much on the performance of routine duties and too little on the accumulation of facts. If the facts demonstrate the value of tests and of routine examinations, no official is going to risk the loss of that information. Much of this work is new and therefore experimental. Certain psychological tests and records will doubtless prove to be of no value to a particular concern. It is therefore important that careful records be available so that a distinction can quickly be made between those that are proving of distinct importance and those that are not.

MENTAL ALERTNESS AND EFFICIENT EMPLOYEES

One of the striking discoveries dependent on the development of mental alertness tests is that men become dissatisfied and do not perform their work efficiently if their mental capacity is either above or below that required by the nature of their tasks. All sorts of reasons may be found to explain why the employee is inefficient or resigns or must be discharged. But the evidence now available shows that the majority of these are false, and that dissatisfaction and inefficiency can more often be traced to a lack of adjustment between the capacities of the employee and the requirements of the task given him. To determine the requirements of the task is the function of the job analysis. To determine the capacities of the applicants is the function of the physical and mental measurements.

The special ability tests as described in the Jan. 28 article illustrate one important series of measurements needed. They do not, except indirectly, indicate the mental level of the applicants. An applicant could conceivably perform these acts successfully and fail to pass the course of instruction that follows; or, passing both, become an employee and there quickly find the routine of his job unbearable. Space will not permit specific illustration of just such actual results. The Bureau of Personnel Research has determined the mental level of several thousand employees of different types in the last five or six years. It has been found very difficult to estimate mental alertness without tests so that employees can be properly placed. Groups that are commonly described as of average intelligence have been shown to be, in some occupations, above, and in others below, the estimated intelligence. Physical and emotional stability factors as determined by the physician, being equal, careful determination of the mental alertness differences in groups enable us to predict progress, efficiency and satisfaction more readily and accurately.

RECORDING THE INTERESTS OF EMPLOYEES

Other questionnaire forms of yet more recent development enable the employment manager to determine the major lines of interest and likes of the applicant. Where there are no distinguishable physical emotional or intellectual differences between two groups, it has been shown by appropriate questions that there is a wide difference in the things in which these two groups are interested; in the things they enjoy doing over and over, and in their ways of working with others. Of course, we all recognize that platform men should not be selected merely because they are needed nor because men want jobs. But in these days of many applicants, and good ones by every measure we have so far been able to apply, it is important to forecast as far as possible the probable length of service of the men selected. Employment managers tell me that this is one of their most pressing problems now. It is therefore important now, as it always will be, to select those men who by nature and training are willing to enter the particular occupation as a life work.

PERFORMANCE RECORDS

It is perhaps unnecessary to point out the need for performance records and for tests in the improvement of performance with practice. So many public service corporations and private corporations as well find these necessary for promotional, disciplinary and legal purposes. Two points may be emphasized. The difficulty of getting satisfactory records of efficiency, and the need for such standards in evaluating the various records of personal history, medical examinations, psychological tests, training courses and later tests for promotion. Many tests have been discarded both by the physician and the psychologist, or by the impatient executive when no one had sufficient data to evaluate the tests. Promotions have been based on factors that bore no relation to continuous efficiency of performance on the part of the individual.

In my very brief comments, I have endeavored to emphasize certain points that, I believe, will keep these new and important aids to proper selection and placement from suffering serious setbacks at the hands of their many friends. I have mentioned two or three forms of examinations that in my opinion should be included in any comprehensive employment procedure.

Digitized by Google

They would require at most thirty minutes additional time of the applicant. But most important of all, the future of psychological examinations ought to be determined on the basis of adequate records and sound statistical procedure.

C. S. YOAKUM,
Director.

The Trolley Shoe or "Slide" at Low Speed

NEW YORK CITY, April 17, 1922.

To the Editors:

I happened to notice C. L. Greer's letter on the above subject, in your issue of April 15, page 641.

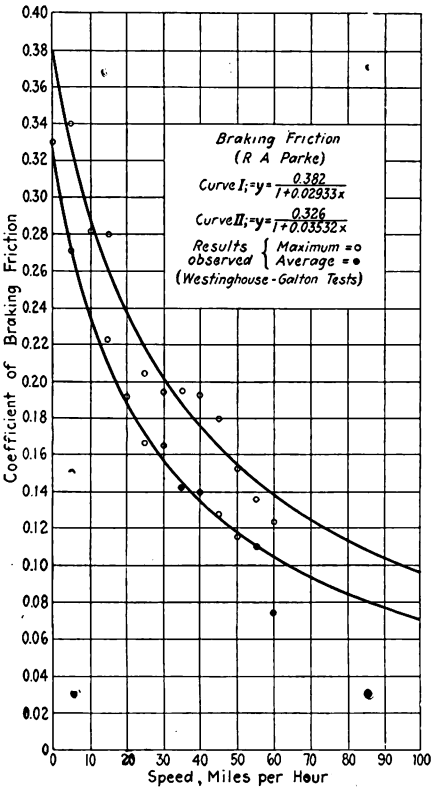
Mr. Greer appears to have proved by tests that the wear on the trolley wire is very much greater at low speed with the slide than with the trolley wheel, and that the extra wear is due almost entirely to increased friction at low speed.

He is entirely right on both points. It may have seemed strange to him, as it usually does to most people, that the friction and wear should be greater at low speed than at high speed; but it is all right, because it is all in perfect accordance with the physics of friction between unlubricated surfaces. As a matter of fact, everybody connected with the operation of a railroad already knows something, in a practical way, about unlubricated friction, because concrete examples of it are brought to his notice repeatedly by the wear of brakeshoes and of carwheels. It is well known that the grip of a brakeshoe on the tread of a carwheel, and the wear which is caused in both the shoe and the wheel, are much greater at low speed than at high speed, with the same contact pressure. Indeed, it is precisely this fact that complicates the action of a brake involving a variation of the brakeshoe pressure as a function of the speed of the train, because a constant shoe pressure means the danger of slipping, above a certain speed, and of skidding, below a certain other speed. Now the friction between a trolley wire and a non-lubricated trolley shoe or slide is exactly of the same physical character as the friction between a brakeshoe and a wheel tread. The explanation is the same and is very simple in both cases, being the physical fact that the coefficient of friction is very high at low speeds and falls off rapidly as the speed increases.

The relation between the coefficient of friction and the "velocity of rubbing," in the case of brakeshoes, was studied exhaustively by Galton and Westinghouse more than forty years ago. The accompanying diagram, taken from the printed notes given to the students attending my lectures on electric railways, about twenty years ago, gives the principal results of the tests made by Galton and Westinghouse, as reported and collated by the late R. A. Parke, a world authority on this subject. In this diagram the abscissas represent the speed of the train or car, in miles per hour, this speed being the same as the "velocity of rubbing" between the brakeshoe and the tread of the car wheel; and the ordinates represent the coefficient of friction corresponding to different rubbing velocities. Now the sliding speed of the trolley shoe or slide is the same as the train speed and the same as the velocity of rubbing of the brakeshoe. Hence, this diagram would also represent correctly the conditions in the case of the friction between the sliding shoe and the trolley wire, if the metals which are in frictional contact in this case were the same. As a matter of fact, however, the difference in dry sliding friction obtained with different metals is not very great, so that these curves approximate closely to the results that would be obtained from actual tests of the friction between metal surfaces of the same kind as the trolley wire and the trolley shoe. The curves will, in any case, be accurate enough to give an idea of the rapid increase in the coefficient of friction as the speed decreases.

By reference to the lower curve it is seen that the coefficient of friction is about 0.12 at 50 m.p.h. and double that value at 10 m.p.h. As the speed is further reduced the coefficient increases rapidly, being 0.28 at 5 m.p.h. and 0.32 at 0.5 m.p.h. The wear should, therefore, be the greatest at the points where the cars run most slowly, or where the greatest number of stops is made. Comparing the points of highest speed and fewest stops on an interurban line with the points of lowest speed and of most frequent stops in cities and towns, we would be warranted, from the curves shown in the diagram, in expecting the wear of the trolley wire to be two and one-half times greater at the stopping points. It would be interesting to know whether Mr. Greer has found as great differences as this. With a lubricated trolley shoe the case is quite different, because the coefficient is then equal, as I have shown in my lectures, to the algebraical sum of two values, one of which is on a descending curve similar to the curves shown in the diagram, while the other is on an ascending curve starting from 0 at zero speed. This means that the friction, when a lubricant is used, is made up of two kinds of friction, namely, solid or unlubricated friction, as before, but to a much lower degree, and liquid or viscous friction. The former decreases, and the latter increases, with the velocity of rubbing. The graph representing the solid friction component is of hyperbolic character, same as in the diagram, but with scales of ordinates which depend upon the condition of the rubbing surfaces, in respect to smoothness and finish, or polish, etc. The graph representing the liquid friction component is of parabolic character, the scale of ordinates depending upon the quality and condition of the lubricant. The resultant curve, representing the composite result, is a two-branch curve, having its highest point at or near "zero" speed, and which falls down to its lowest value at a very low speed and then rises as the speed increases. The scale of ordinates, in this case, depends upon both the condition of the rubbing surfaces and upon the quality and condition of the lubricant, as might be expected.

C. O. MAILLOUX.



FRICTION BETWEEN UNLUBRICATED METAL SURFACES AT DIFFERENT SPEEDS

Electric Railway Publicity

Devoted to How to Tell the Story

Illinois Travels De Luxe

THE Illinois Traction System, Peoria, Ill., is now advertising its four-car electric train which operates nightly between Peoria, Springfield and St. Louis. So inviting is the service offered, in addition to the smokeless and cinderless feature of the trip by trolley, that no doubt the ticket agent will soon acquire the haughty air heretofore known only to the box office manager of a New York theatrical success. The folder, well illustrated, talks variously of the observation compartment of this marvelous train, the club compartment, with tables for writing of cards, and the smoking compartment.

The Pullman accommodations on the train beget wonder, and in themselves could win all traffic, for each of the twenty berths is nearly 6 in. longer than in Pullman cars on steam trains. Windows are provided in upper berths, and both upper and lower berths have safety deposit vaults for valuables. The train, which was on exhibition at the midwinter meeting of the American Electric Railway Association, is 216 ft. in length, weighs 360,000 lb., and cost $107,000. While the train was on exhibition near the Claypool Hotel where the Indianapolis meeting was held more than 10,000 persons inspected it. It received much publicity both at Indianapolis and in towns en route, where large crowds, informed in advance of the arrival of the special, collected to inspect it.

A heavy-duty sixty-ton electric locomotive is used to transport the passenger coach, sleeping car and parlor car. Engineers of the Illinois Traction System designed the equipment and part of it was built in the company's shops. Officials of the company feel that the train demonstrates the comfort and safety of electric railway transportation and the possibilities which lie in the interchange of equipment between electric and steam lines.

Officials of electric railways in Illinois were carried to the Indianapolis meeting in the car. Throughout Illinois the train was operated over lines of the Illinois

Traction System. From Danville, Ill., to Crawfordsville, Ind., the tracks of the Big Four Railway were used. At Crawfordsville the train switched to the tracks of the Terre Haute, Indianapolis & Eastern Railway.

Sousa Concert Widely Advertised

THE Shreveport Railways utilized the local concert engagement of John Philip Sousa to advertise the convenience of the railway service. Practically the entire quarter-page advertisement was devoted to the announcement that Sousa and his famous band would play at the Fair Grounds. His program was announced in full, and a short biographical note of the conductor was contained in the advertisement.

The concert and the railway were coupled finally with the following:

The weather being inclement, you will be glad if you leave your automobile at home while attending the concerts and use the street cars. No Skid—No Danger—and much cheaper. The street cars take you to the Fair Grounds gate. You have a smooth concrete walk up to the Coliseum. Cars go to the Coliseum every seven and one-half minutes. There will be plenty of extra cars for the rush after concerts are over. Ride the street cars.

Utility Problems Discussed Direct with Public

A SERIES of fifteen meetings with stockholders of the Public Service Corporation of New Jersey was started on April 3 when Thomas N. McCarter, president, discussed the problems of public service enterprises on the Proctor Theater roof, Newark. With Mr. McCarter were Percy S. Young, vice-president in charge of finance; Edmund W. Wakelee, vice-president and general solicitor, and Harlow C. Clark of the publicity department, who also spoke. Mr. McCarter described the meeting as the first of a series of "one night stands" throughout the State.

In the audience were 1,500 men and women. It was estimated by company officials that a quarter of these were employees and the others stockholders. Mr. McCarter made an appeal for co-operation of stockholders, and asked that the company's past mistakes be forgotten. On his part he promised to forget the sharp criticisms directed at himself, and expressed hope that eventually every customer of Public Service would be a stockholder in the concern, paying monthly bills with dividends received.

Mr. McCarter said the idea of meeting the stockholders was advanced first by the head of the Pacific Gas & Electric Company in California and that he intended to "go about the State presenting the gospel of public service in one night stands" with his associates, making friends as best they could. Telling of 58,000 holders of company securities, he spoke of their remarkable power to create public sentiment that "would stand by us if we are right and see that we get a fair deal."

"The man at the head of a public utility company who does not crave the help and co-operation of the stockholders does not deserve the authority to run a corporation," Mr. McCarter said. He declared the two campaigns his company had made to have the general public become stockholders in the company had "just touched the fringe" and he hoped to see the company's 800,000 gas and electric patrons, as well as others, take stock in the concern eventually.

He announced himself as an optimist and said now that the war's problems are practically over the corporation is emerging from its handicaps better than ever. He referred to newspaper reports to show the stock is appreciating in value, and said the great activity of Public Service securities on the New York Stock Exchange augured well for the future of the company.

The problem ahead of Public Service is to get $5,000,000 or $6,000,000 of new capital each year, to keep pace with the growth of business and the public demand for improved service, he said. The bond market was exhausted for company securities and investments in common and preferred stock must provide this additional capital, Mr. McCarter added.

He said handicap results when the demagogue, the politician or any one else steps in to put a stop to this flow of financial support from the public. "He only cuts off his own nose as, deprived of this aid, the company is unable to supply the needs of the public," said Mr. McCarter.

Railway Wants to Know Sentiment of Patrons

A CAMPAIGN to determine the sentiment of residents of northern Kentucky regarding Green Line service is under way by the South Covington & Cincinnati Street Railway, Covington, Ky. Questionnaires are being placed in every home in northern Kentucky, ostensibly for the purpose of aiding the traction company with suggestions as to how to improve its service for the benefit of the public. The questionnaires also are distributed in the Dixie Terminal and boxes have been provided in the cars for the receipt of the questionnaires when filled out.

The Federated Improvement Association of Covington has issued a statement warning the citizens not to sign any papers asking for an increase in fares until they heard the people's side of the question.

The South Covington & Cincinnati Street Railway is operating under a perpetual franchise in northern Kentucky cities which fixes the fare at 5 cents. Several years ago the traction company offered to surrender its perpetual franchise and accept in lieu a twenty-year franchise with the right to increase fares. The offer was rejected by the City Commissioners of Covington and Newport.

Polk Laffoon, president of the traction company, said that the company is merely trying to ascertain the sentiment of its patrons relative to its service by the distribution of the questionnaires and is not endeavoring to get as many signatures as possible and then present a petition to the city commissions of northern Kentucky municipalities with the request that the company be given the right to increase its rates of fare.

A copy of the questionnaire is as follows:

To Green Line Patrons:

The development and progress of northern Kentucky depends on adequate transportation. We are trying to do our part to provide as much service and as well distributed accommodations as have been possible considering the revenue we have been receiving.

Our public relations department was organized to acquaint you with the operation of the Green Line and its relations to the development of Campbell and Kenton Counties. Through the "Topics" our problems have been explained; the difficulties which have beset us in trying to make our income meet the demands made upon it, and the uncertainties regarding future developments, have been brought out.

Requests have been made for changes, bettered and additional service, and service impossible under our present

Digitized by Google

franchises. In keeping with our endeavors to give Green Line patrons what they want and need, we desire to obtain expressions from the car riding public showing what service is wanted in each locality.

Your reply is earnestly solicited in order that we may best serve your requirements. Kindly fill in this sheet carefully, and then hand it to the conductor on your next trip or drop it in the "question boxes" provided at the Dixie Terminal and waiting stations.

1. What car lines do you ride?.....
2. How many members of your family use the cars?....
3. Is time between cars satisfactory?..... (Yes or No). If not, what would you suggest?.....
4. Are more cars needed on the lines you use?..... (Yes or No). If so, should additions be to the regular or "rush" service?.....
5. What betterments or additions would you suggest? .....
6. How far will you go to aid us in bettering service, considering facts we have shown regarding the Green Line Nickel? .....

If It's Good for a National Advertiser It's Good for You

FOR years the Tri-City Railway, Davenport, Iowa, sold the advertising rights in its cars, but used none of this space itself. The space was always at a premium and the best known nationally advertised brands of foodstuffs and other goods were displayed there. The company also sold the right to place banners on its cars, but never used this space itself.

The year 1922 has marked a decided change. The company, in addition to selling space, has reserved some itself and every car now operating carries either an advertisement urging the public to buy United Light & Railway's prior preferred stock or educational copy.

For instance, a signboard swung in the top of the car carries these statements:

"This company has been required to invest over two-thirds of a *million dollars in paving.*"

"*In 1921 the fare of every twelfth passenger* went to pay interest and depreciation on this investment and did nothing to improve the cars or rails on which you ride."

"*Passengers on street cars don't ride on pavement.* Seems as if the paving should be paid for by those who use it."

"*Gentlemen*: Fairness and consideration for the women and children require that there be NO SMOKING on this car."

On the reverse of the card is a placard like this:

"YOU WILL BE INTERESTED TO KNOW

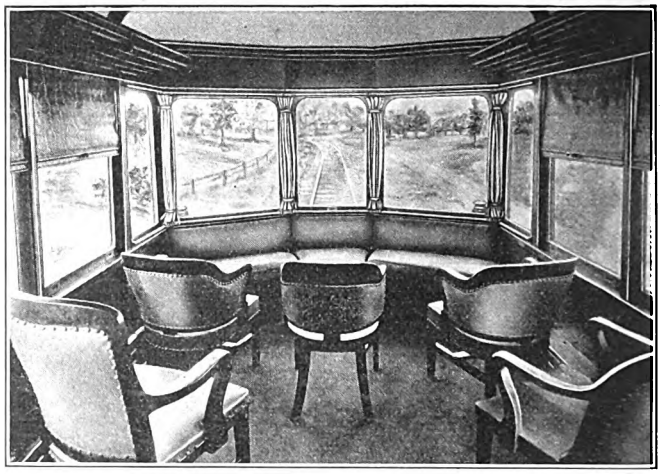
"That last year, a year of hard times—the Tri-City Railway Company alone paid out to your community—$461,260 in wages, or $1,260 each day; $134,670 in supplies, or $370 each day; $66,400 in direct taxes, or $182 each day.

"That's trading in your home town, isn't it? Two-thirds of a million dollars in the year, $75 worth every hour."

President B. J. Denman is planning to continue the advertising campaign and a series of strong arguments has been prepared which are designed to win more consideration for the utilities by the public. Thus there is presented for study the strange case of a utility company finally realizing that right at hand on its own property there is presented, perhaps, the very best medium of communication with the public. In other words, Tri-City Railway has been "sold" on its own advertising space, space which the biggest national advertisers in the country were "sold" on long ago.

Comfort Plus!

BY PROVIDING luxury, plus service, the Kansas City, Clay County & St. Joseph Railway is keeping itself favorably before the public. Its latest appeal to the luxury complex, as Freud would term it, takes the form of a parlor and observation compartment made part of a regular car. Parties attending meetings take to this club car as through the ages the proverbial duck has



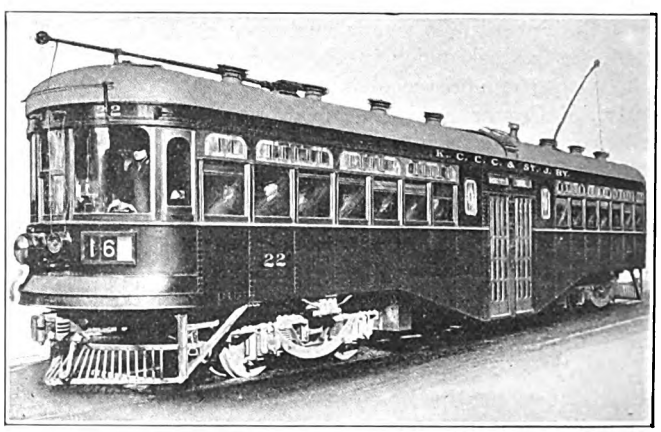
LUXURIOUS OBSERVATION END OF CONVERTED CAR

taken to the omnipresent water. The special compartment, with its soft carpet, upholstered chairs and soft draperies, provides a convenient and secluded place where conferences can be held en route from or to Kansas City, St. Joseph, Excelsior Springs, Liberty and other way points.

To charter the car a minimum of fifty round-trip tickets must be purchased at regular fare.

It takes less than an hour to convert one of the regular standard steel cars, 60 ft. in length, into the special. The six regular car seats of the rear twelve-foot compartment are unscrewed and five mahogany office chairs and three leathered folding chairs substituted. A heavy wilton carpet is used to cover the floor and is fastened with grommets and knobs. The entire equipment cost $284.

It is a wonderful territory through which the Kansas



EXTERIOR OF TYPICAL CLAY COUNTY CAR

City, Clay County & St. Joseph road operates, a country in which there is something new to be seen on every trip. The way to see it best, of course, is from the luxurious observation end of one of the Clay County cars.

Rail Cars Must Combine Automotive and Railroad Practice*

By Charles Guernsey
General Manager Railroad Division, Service Motor Truck Company

PREVIOUS to 1905, efforts had been made to build a single-unit car, steam-propelled, for use on railroads, These cars were unsuccessful, owing primarily to boiler limitations. The light-fire engine type of boiler was too expensive to maintain and the locomotive type was too heavy. They had no particular advantage over the ordinary type of steam locomotives. They did not eliminate roundhouse supervision, etc. About 1910 the General Electric Company developed a car propelled by electric motors, current for which was supplied by a 200-hp. gasoline engine connected to an electric generator. A number of these cars were built, and some of them are still in service. They were not successful, however, because the great weight, complication and maintenance expense made their operating cost almost as high as that of a steam train.

Mr. McKeen of the Union Pacific developed the McKeen car, of which probably more have gone in service than any car yet developed. Here again, however, the great weight necessitated an engine considerably larger than was commercially accepted, so that the total operating cost of the car was only slightly less than the operating cost of the steam train. Cars of the McKeen type were not popular, because the builders attempted to provide in a gasoline car the same capacity and speed supplied by the ordinary steam train, consisting of a locomotive and two cars. Wherever such capacity is required, the steam train can ordinarily be operated at a profit. The real field for the gasoline car is in service where the steam train has more capacity than is required.

About ten years ago a car was built by the J. G. Brill Company, Philadelphia, on contract for the inventor. The engine was mounted amidships, driving by silent chain to a countershaft from which the drive was by propeller shaft to two bevel gear axles, one on either truck. Cars have been built by Hall-Scott, Sargent and others.

It is generally conceded that for continuous heavy duty work engines having cylinders larger than a 5-in. bore are not commercially successful. Warpage, lubrication difficulties and heating of valves, piston heads, etc., become too difficult to handle. If this is correct, then the failure of the heavy cars can be traced directly to a failure to appreciate the limitations of the gasoline engine.

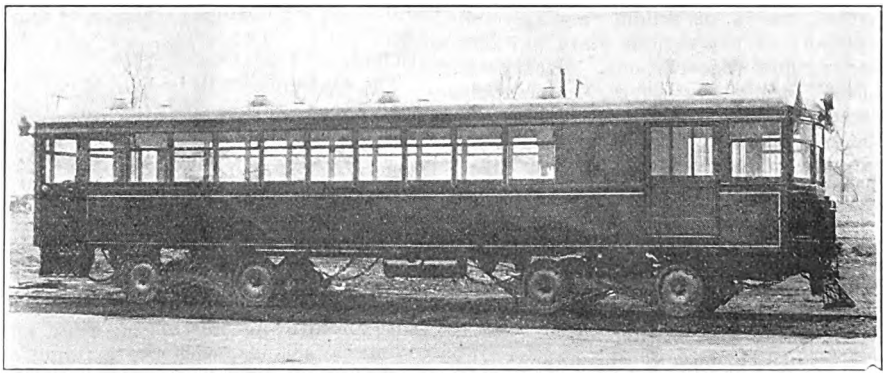
So much for the development by the railroads and railroad men. On the other hand, manufacturers of motor trucks have for several years equipped chassis ranging from ¾-ton to 5-ton capacity with flanged driving wheels, to adapt them for operations on rails. These cars have in general been successful. Owing to the light weight, low rolling resistance and the small engines required and in some installations to the fact that they can be handled by one man, the operating cost has been low. These converted motor trucks, however, were unduly limited in capacity and speed. There still remains a decided middle ground between the rail bus or rail car, as we have known it in the past, and the field of the steam train. It is in this middle ground that the gasoline rail car can make a place for itself, provided it is designed specifically for operating on rails. It is in no sense a converted motor truck. It represents a combination of automotive and railroad practice.

In the past the designs have been based almost entirely on one practice, to the exclusion of the other. To illustrate the point, some of the earlier cars developed by the railroad men weighed more than 50 tons and required a 300-hp. engine, although they had seats for only from fifty to sixty passengers. They did not give due consideration to the automotive side of the design. They attempted to use a gasoline engine in a car of steam railroad design.

By careful design and the use of alloy steels, anti-friction bearings and other features proved in automotive use the weight can be materially reduced. Weight must be a minimum in order to keep the rail car requirements within the capacity of proved gasoline engines.

It is just as undesirable to forget the railroad point of view entirely. Many of the features of railroad designs are the result of almost a century of development. The designer must weigh his problem carefully, choosing from railroad practice those features which fit in with this new type of equipment.

The rail car should combine the light weight of the motor truck with the safety, steadiness, comfort and convenience of the steam coach. This means that it should include such features of design as four-wheel pivoted trucks front and rear, full speed either direction, air brakes and safety appliances. The rail car shown here has an over-all length of about 44 ft., a seating capacity of thirty-eight, drop seats for eight in the baggage room, making a total capacity of forty-six passengers. The baggage space is 70 sq.ft. The car is provided with standard vestibule doors, saloon, comfortable seats and electric lights. Yet the total weight of this car is only 13 tons. This is less than one-third of the weight of the old-time motor cars of the same capacity, and a 60-hp. engine can be used, as against the 200-hp. engine required by the other types. At the same time a speed of 48 m.p.h. has been obtained, and a speed of 35 m.p.h. can be maintained indefinitely without damage to the mechanism. The fuel consumption is small, the car running between 5 and 7 miles to a gallon of gasoline. Because of the light weight, the car has a good acceleration, a speed of 25 m.p.h. being reached from a standstill in thirty seconds.



GASOLINE CAR FOR RAIL SERVICE. IT WEIGHS 13 TONS AND CARRIES THIRTY-EIGHT PASSENGERS, WITH DROP SEATS FOR EIGHT IN BAGGAGE COMPARTMENT

This car is arranged with two four-wheel pivotal trucks. The drive is from the power plant located forward, through an auxiliary transmission contained in the bolster of the front truck, to the two axles of the front truck. The auxiliary transmission is so arranged that either one of two pairs of gears can be used to transmit the drive, thus giving in effect two high gears. One of these gears is proportioned for the ruling grade on the particular railroad where it is to be used, while the other gear is proportioned to give a maximum speed in straight-away operation.

The success of the rail car, after all, hinges primarily on the engine. The car must be designed with this thought always uppermost. The engine must stand up under the severest service. It must be capable of operating continuously at high speed and under wide-open throttle. It must operate with the minimum of vibration. Everything must be accessible and so arranged that repairs can be made quickly.

The gasoline rail car will enable many branch lines and short lines, which are

*Abstract of paper given March 29 at Indianapolis before Indiana Section, Society of Automotive Engineers.

Digitized by Google

now operated at an enormous loss, to be converted to a money-making basis. A 13-ton car has low first cost and can be operated for 20 to 30 cents per car-mile, as against a cost of $1 to $2 per mile for steam operation.

The gasoline rail car as a unit possesses many advantages over steam and electrified service—speed, frequent service, low cost of operation, crew of one or two men, elimination of the usual terminal facilities and great reduction in initial cost and fixed investment. Frequent service can be given, which may not be justified by a steam train. A freight-carrying unit can be installed in conjunction with a passenger unit, at an initial cost much below that of a passenger unit.

Utilities Division Purchasing Agents' Association Proposed

A MOVEMENT is under way in the National Association of Purchasing Agents, which has a membership of approximately 4,500, to form a division for public utility purchasing agents including the electric railways, light and power, telephone, water and gas companies, many of whom are already members of the various state purchasing agents' associations. Harry H. Lloyd, purchasing agent, Indianapolis Street Railway and the Terre Haute, Indianapolis & Eastern Traction Company, is chairman of the public utilities committee and public relations committee of the Indiana Association, and was appointed chairman of the tentative national committee at the Indianapolis convention of the National Association of Purchasing Agents.

Mr. Lloyd reports that a great many public utility buyers throughout the country are interested in a division of the national association which will be devoted to the common interests of the utilities and still maintain the advantage of affiliation with the purchasing agents of the big manufacturing industries of the country. Mr. Lloyd had suggested the formation of utility committees in various states which will be co-ordinated in a non-geographical national committee and will also develop an interest of the railway membership in the purchase and stores committee of the A.E.R.A.

It has been suggested that as the National Association of Purchasing Agents holds its convention at Rochester, N. Y., May 15 to 20, 1922, as many utility purchasing agents as possible attend this convention whether already members of the various state purchasing associations or not. If sufficient interest is manifested in the movement by the public utility buyers, it will be possible to have a national committee definitely organized at that time. Mr. Lloyd says this should be of great advantage to the various utilities throughout the country.

A dinner for utility purchasing agents will be held on Tuesday, May 16, at the Rochester convention, and also a joint conference with the national fuel committee.

Improvement in Unemployment Situation Among Engineers

ACCORDING to reports from the Employment Service Bureau of the Federated American Engineering Societies the records of the first quarter of 1922 indicate a distinct improvement in the unemployment situation in the engineering profession. There was a 41 per cent increase in the number of men placed by the bureau and more than 100 per cent increase in the number of available positions listed with the bureau in this quarter compared with the same quarter.

The bureau reports that there is a noted increase in the higher grade openings which are sent in, indicating that many companies are actively preparing for a return to more normal business conditions, in the mind of the bureau.

Public Conference on Business Training of Engineers Called

THE United States Commissioner of Education is calling a second public conference on commercial engineering to investigate business training of engineers and engineering training for students of business.

The conference will be held May 1 and 2 at the Carnegie Institute of Technology in Pittsburgh. Outstanding topics at the conference will deal with the new problems that have recently arisen in modern industries, the solution of which demands a more scientific approach to include job analyses and personnel specifications and a translation of these into a new and teachable content for use in our engineering and commerce schools, with the training of the engineer for a better understanding of problems relating to community development and with the training of the engineer for management of overseas engineering projects.

Southwestern Electrical & Gas Association

A JOINT meeting of the Southwestern Geographic Division, N. E.L.A., and the Southwestern Electrical & Gas Association will be held in San Antonio May 3 to 6. A summary of the program follows:

Wednesday, May 3. Morning, opening joint session. Afternoon, separate meetings of the following sections or committees: accounting, commercial, public relations, technical, railway.

Thursday, May 4. Morning, joint session. Afternoon, separate meetings of the same sections mentioned above. Evening, banquet.

Friday, May 5. Morning, joint session. Afternoon, joint session followed by executive session, N.E.L.A. division; separate meetings of power and railway sections.

Saturday, May 6. Morning, executive session of S. E. & G. A.; separate meetings of accounting technical and public relations sections, southwestern division, N.E.L.A.

A list of the papers scheduled for presentation at the railway sessions follows:

"Merchandising Transportation," by G. I. Plummer, superintendent of traffic, Dallas Railway.

"Economics of Car Maintenance Through Modern Shop Practice," by Walter Silvus, master mechanic, Texas Electric Railway.

"Methods for Relief from Traffic Congestion," by W. H. Holden, superintendent of transportation, San Antonio Public Service Company.

"Standard Transfer for Different Companies." Round-table discussion lead by A. B. Paterson, acting general superintendent of railways, New Orleans Railway & Light Company.

"Accident Prevention Methods," by Alves Dixon, superintendent of railways, El Paso Electric Railway.

"Vocational Training," by C. J. Crampton, superintendent of safety and efficiency, Dallas Railway.

"Adjustment of Track Construction and Maintenance to Modern Light Weight Cars," by R. G. Taber, engineer, Stone & Webster, Fort Worth.

"Operation of Double Truck Cars with One Man," by G. S. Brush, superintendent of transportation, Houston Electric Company.

"Possibilities of Motor Bus or Trolley Bus for Suburban and Feeder Service." Round-table discussion led by J. P. Griffin, general passenger agent, Texas Electric Railway.

"Overhead and Car Current Collecting Devices," by L. E. Delf, electrical engineer, Northern Texas Traction Company.

"Training Platform Men," by W. E. Robertson, superintendent of transportation, Eastern Texas Electric Railway.

"Accounting for Passenger Receipts," by W. R. Burns, assistant treasurer, Dallas Railway.

American Association News

Heavy Electric Traction

THE committee on heavy electric traction of the Engineering Association held its organization meeting in New York City on April 20. The result of the conference was a plan for compiling data and for digesting the discussion on this subject at the Rome International Railway Congress, which, by a coincidence, was in session at the same time. The New York meeting was attended by these members: Sidney Withington, New Haven Railroad, chairman; A. H. Armstrong, General Electric Company; H. W. Cope, Westinghouse Electric & Manufacturing Company; J. C. Davidson, Norfolk & Western Railway; J. H. Davis, Baltimore & Ohio Railroad, and L. S. Wells, Long Island Railroad. J. V. B. Duer (who was attending the Rome congress) was represented by Mr. Viele.

PERSONAL MENTION

Favors Purchase Plan

55,669 Votes in Favor of Municipal Ownership—Mayor Hopeful for Future Operation

Detroit electors voted with a majority of nearly 82 per cent indorsing the Detroit United Railway purchase plan, thus ending the thirty-year traction war and again approving municipal ownership. The Detroit United Railway's city system will be taken over on May 15 as provided in Mayor Couzens' proposal and replaced by a municipally-owned system, which according to the plans of the municipal street railway officials is to be made the largest municipal ownership system in the world as well as one of the finest in the world. Because of bad weather conditions and the lack of interest on the part of some of the qualified voters, only a small vote was cast. Of the 67,912 votes polled, 55,669 were in favor of the purchase plan, giving a considerable larger percentage than the 60 per cent favorable vote required.

$2,770,000 Down Payment

In connection with the purchase plan approved, a bond issue of $4,000,000 was voted, of which $2,770,000 will be paid as a down payment on the D. U. R. when the system is turned over to the city. The remainder of the bond money will be used to purchase material and supplies which the company has on hand and which the city has agreed to purchase, and to provide working capital. Semi-annual payments of $500,000 will be made by the city until 1933 at which date the balance of the $19,850,000 will come due. Interest at the rate of 6 per cent will be paid on all of the unpaid balance. The money will go to a trust company to the credit of mortgage and bondholders of the company.

Mayor James Couzens, who has consistently maintained that the lines can be made to pay under city ownership, believes the city will be able to make its payments out of the earnings from the system and that in addition enough will be earned to rehabilitate the property. The city will not be liable in event the system fails to make enough money to meet the payments. The company interests could collect only by going into the courts and attaching the street car property. The property could be taken back in event of default on the part of the city but no collections could be made from taxes, or tax money.

On the morning of the day of transfer of the property to the city, it is planned to have every car manned by a city employee as it pulls out of the carhouse. The change is to be made with as little interruption of service as possible. Present Detroit United Railway employees will be retained except where it is necessary to cut down the force. The Mayor favors retaining all platform employees who show that they have the municipal ownership idea of giving the public the best service.

In a statement given out by E. J. Burdick, vice-president and general manager of the Detroit United Railway, he is quoted as saying that it is only fair to all concerned to state that the taking over of the property at the price paid is fully $10,000,000 below its actual present day worth. The property as it stands, he said, with a reasonable expenditure of money, can be made one of the best going-concern railroads in the country, and with this great undercapitalization and with the fact that it is a good going concern with an excellent organization, there is no reason why the city should not succeed in the venture.

He further stated that had the company in the past been given definite rights, whereby its officials could have gone to the money markets of the world and secured cash to make the reasonable extensions and betterments to the service, many of the arguments that have arisen from time to time could have been avoided. The company officials stand ready to do anything they can to facilitate the undertaking, Mr. Burdick stated.

It is cited that when the systems are combined, Detroit will have the largest municipally owned street railway in the world including 263 miles of track with 1,457 cars and all the necessary equipment.

Funds Provided for Electrification by Stock Authorization

Stockholders of the Illinois Central Railroad at their annual meeting on April 19 approved the issue of $50,000,000 of preferred stock to finance the Chicago Terminal improvement and electrification work. While no decision has been reached as yet as to the system of electrification that will be adopted, work will begin soon on the lowering of the grade from Forty-third Street to Thirty-first Street and raising the grade from Forty-third Street to Fifty-first. This work is a necessary preliminary to the electrification of the road and will require nearly two years to complete. No decision on the system of electrification will be reached until after A. S. Baldwin, vice-president in charge of the electrification work, has returned from Europe, where he has been studying recent developments in connection with trunk line electrification there. Mr. Baldwin is expected to return the latter part of May.

Check for $2,934,112 Refused by City

Maintaining its position that the companies have broken the contract ordinances, the city of Chicago on April 10 refused to accept from the Chicago Surface Lines a check for $2,934,112, representing 55 per cent of the net receipts for the year ended Jan. 31, 1922. This added to the amounts due for the two previous years makes a total of $6,526,091 which is being held until it is seen whether some compromise can be reached.

It is expected that a fight will be made on the companies' refusal to pay interest on this amount even if the principal is finally accepted. The courts have indicated that the Surface Lines have not broken the contract, and several Aldermen have insisted that the city change its attitude. This money, which now totals about $36,000,000, can be used only for transportation purposes and it is expected to be a nucleus of a subway fund.

Houston Improvements Started

The Houston (Tex.) Electric Company has started work on its program of improvements and betterments promised under its agreement with the city in return for a sixteen-year extension to its franchise. The traction company is pledged to spend $1,250,000 within the next two years. The company's first improvements will be the double tracking of the line on Lorraine Street from Gano to Maury, and work has begun on this project. Double tracking of portions of other lines will follow shortly.

The traction company will give "jobless" men who have been working for the city at $1.25 a day on Hermann Park improvements the first chance when recruiting its construction gangs. Officials of the company made this promise to Mayor Holcombe.

In addition to extensions and improvements already listed, and which have been announced in previous issues of the Electric Railway Journal, the street car company announced that it intends to purchase thirty-five new cars at once, to put into service as soon as delivered. These will cost $270,000. Besides this the company will repair and repaint thirty-six of its old cars, which have been stored in the carhouses, and put them to work.

The new car fare system also has gone into effect. Metal tokens are on sale in thirty-eight drug stores and other convenient places. Sixteen are sold for $1 or four for 25 cents. Half fare tokens are also sold thirty-two for $1. It is contemplated that tokens will be sold in other places to be added from time to time.

Brooks-Coleman Act Held Constitutional

The Brooks-Coleman act passed by the 1921-1922 Minnesota Legislature providing for regulation of electric railway rates based on true valuations of properties was held constitutional by Judge H. D. Dickinson of the Hennepin County District Court on April 12, in denying the motion of an intervenor in a suit brought by the city of Minneapolis against the Minneapolis Street Railway. The intervenor, George H. Friend, attacked the constitutionality of the law. The judge held that neither fundamental principles of the home rule government of the city nor the constitution of either the state or the United States had been infringed upon by the law. The decision is similar to those handed down previously in Ramsey and St. Louis Counties, at St. Paul and Duluth. John M. Rees, counsel for Mr. Friend, indicated that the case would be taken to the Supreme Court.

In his opinion the judge said that it is to be noted, contrary to popular misconception, that the act does relieve the city of a general control and supervision of the operation of the railway lines. Full plenary powers are reserved to the City Council. The subjects upon which the State assumes control are limited to rate making, supervision of stock and bond issues and the determination of property valuations for certain purposes.

The State Supreme Court has sustained the validity of a similar act by which all local franchises to telephone companies are surrendered and brought under state control through the Railroad & Warehouse Commission. The whole subject is one wherein the Legislature is supreme. The question of state control of public utilities is one of public policy entirely.

Supplementary Report in Paving Case

A supplementary report was issued by the Public Service Commission of Pennsylvania on Nov. 22, 1921, in the paving case of the borough of Swarthmore against the Philadelphia Rapid Transit Company, referred to in the ELECTRIC RAILWAY JOURNAL for April 1, page 573. Subsequent to the presentation of the original report in this case, the time during which the order should be held in abeyance was extended, on the petition of the borough, in order that a full opportunity might be afforded the parties to consider and act on the recommendations therein made. In November the commission was advised by the municipality, through its solicitor, that it had decided it would be unwise for it to accept such recommendations, and also that the borough had not adopted any program of highway improvement with respect to Yale Avenue. In consequence of these developments the commission is of the opinion that further consideration of any change in the character of the pavement was a matter that should await the action of the municipality with regard to the portion of the highway not occupied by the respondent.

The suplementary order of the commission follows:

It is further ordered, That the respondent, Philadelphia Rapid Transit Company, generally maintain and keep in repair that portion of Yale Avenue in the Borough of Swarthmore which lies between its rails and to the end of its ties, so as to be at all times safe to the public and to the employees and patrons of the utility, and so as to make a smooth riding surface over the same for vehicles.

It is further ordered, That the Philadelphia Rapid Transit Company shall not pave or maintain that part of Yale Avenue in the Borough of Swarthmore outside of the railway strip, nor do any other thing specified to be done by it in the ordinances referred to in the commission's original report, nor shall said company pay for the doing of such things by advancement, reimbursement or otherwise unless this commission shall first find and determine that such work or payment shall not prevent or unduly interfere with the ability of the said Philadelphia Rapid Transit Company adequately to perform and properly to meet the duties and liabilities imposed on it by the public service company law.

Terms of Bill Reviewed Authorizing Service-at-Cost

Governor Miller of New York, as noted in the ELECTRIC RAILWAY JOURNAL for April 15, has signed the act to amend the public service commission law to define service-at-cost contracts. Under the law as changed municipal corporations having a population of less than 1,000,000 inhabitants and street surface railways are authorized to enter into service-at-cost contracts and the Public Service Commission is authorized to approve and validate such contracts. The provisions of the measure follow:

Section 1. Section forty-nine of chapter four hundred and eighty of the laws of nineteen hundred and ten, entitled "An act in relation to the public service commission and the transit commission, constituting chapter forty-eight of the consolidated laws," as added by chapter one hundred and thirty-four of the laws of nineteen hundred and twenty-one, is hereby amended by adding thereto subdivisions nine, ten and eleven, as follows:

9. Service-at-cost contract defined. A service-at-cost contract is an agreement between a municipal corporation and a street surface railroad corporation, providing generally for operation of a street surface railroad wholly or partly within the limits of such municipal corporation, with a rate of fare directly or indirectly dependent upon the excess of revenues after deductions for operating expenses, maintenance, taxes, allowances for renewal and depreciation and a return on the value of the property used and useful in the service rendered.

10. Authority to enter into service-at-cost contracts. All municipal corporations and street surface railroad corporations now existing or which may hereafter exist have and shall have power to enter into service-at-cost contracts as herein defined.

11. Approval of service-at-cost contracts by public service commission. Any party to a service-at-cost contract, as herein defined, upon ten days' written notice, served in the manner provided by the civil practice act for the service of a summons, to the other party or parties to such contract, may present such contract to the public service commission for its approval. The public service commission shall have the power to approve such contract and any agreement purporting to be such a contract, if entered into between the proper parties subsequent to the first day of July, nineteen hundred and twenty, so presented to it upon filing proof of service of notice of presentation as hereinbefore provided. Upon approval by the public service commission, every such contract is and shall be valid and binding as between the parties thereto as of, from and on the day of the date of the execution thereof, in all respects and for all purposes therein expressed, and no provision of any law, general or special, unless the contrary effect shall be specifically stated in any general or special law which shall hereafter take effect, shall or be deemed to interfere with or affect such service-at-cost contract or any provision thereof, or the performance and carrying out of such contract and each and every provision thereof. The execution of any such existing service-at-cost contract and all acts thereunder are, upon the approval of such contract by the public service commission, validated.

Sec. 2. Application of act. This act shall apply only to municipal corporations having a population of less than one million inhabitants according to the last preceding federal census, anything to the contrary herein notwithstanding.

Sec. 3. This act shall take effect immediately.

Philadelphia Dividends to Employees to Go Into Common Dividend Fund

On April 6 the employees of the Philadelphia (Pa.) Rapid Transit Company, speaking through their elected representatives, enthusiastically indorsed President Mitten's suggestion that the entire 1922 co-operative wage dividend be deposited in a common investment fund, each depositor sharing its earnings in proportion to the amount of his savings so invested.

Following the convention of committeemen opportunity was immediately afforded all employees to express their approval of the action of their representatives by signing authorizations empowering the trustees of the co-operative wage dividend fund to proceed forthwith along the lines proposed by the president.

Within forty-eight hours more than 99½ per cent of the full personnel of the system had gone on record in approval of the new idea.

In urging the men to the action they have now taken Mr. Mitten said:

Just as I formerly counseled you to deposit your extra wage with the saving fund, so I now urge upon you to turn over the co-operative wage dividend, when paid, to a committee of your own selection, consisting of four trustees who, with the co-operative council, should be empowered to act for you.

The co-operative wage dividend in the hands of your committee should, of course, be subject to withdrawal by any employee who leaves the service, the same as in the saving fund, and in case of death should be paid to the family. Similarly, income derived from investment made with this fund should be distributed to you in cash, by the committee.

We are preparing ourselves to act as principals, so that we may participate in profits. To do this, we must keep our co-operative wage fund together, so as to be able to speak with the authority of capital. We must be prepared to take the risk that capital takes in making investment, excepting that our risk will be less, for capital, in making its investment, never knows how far it may safely depend upon labor.

Capital has always spoken authoritatively because of its money power. Men and management, with capital added, are stronger than is capital standing alone. We here, by keeping our co-operative wage dividend undivided, can together, as time passes, more and more effectively function as a principal in the hiring of capital, as against the heretofore universal practice of capital hiring labor.

More Turnstiles Ordered. — The New York Transit Commission has given permission to the Interborough Rapid Transit Company to install 430 additional turnstiles in its subway stations. The Brooklyn Rapid Transit Company has also received permission to install twenty-nine turnstiles of a different type.

Hearing on the Bacharach Bill Next Week

The House judiciary committee will hold a hearing on April 25 on the Bacharach bill, limiting the jurisdiction of federal courts over the orders of the public service commissions. From indications the hearing will be well attended, many mayors, governors, public service commissioners and other state and city officials having signified their intention of being present.

In addition, representatives of numerous bar associations and public utility corporations are expected to testify against the measure. If enacted into law, public utility companies will lose the right of appeal to the federal courts and must look to state courts for relief from oppressive orders of public service commissions. The prospects for the passage of such a law are regarded as rather dubious by official Washington. The terms of the measure were referred to in the ELECTRIC RAILWAY JOURNAL for April 8, page 607.

Railway Employees Must Be Their Own Representatives

C. A. Smith, general manager of the Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio, recently sent formal notice to the employees that when the existing wage contract expired on May 1 the company would not deal with outsiders in the discussion of a new contract. The letter follows:

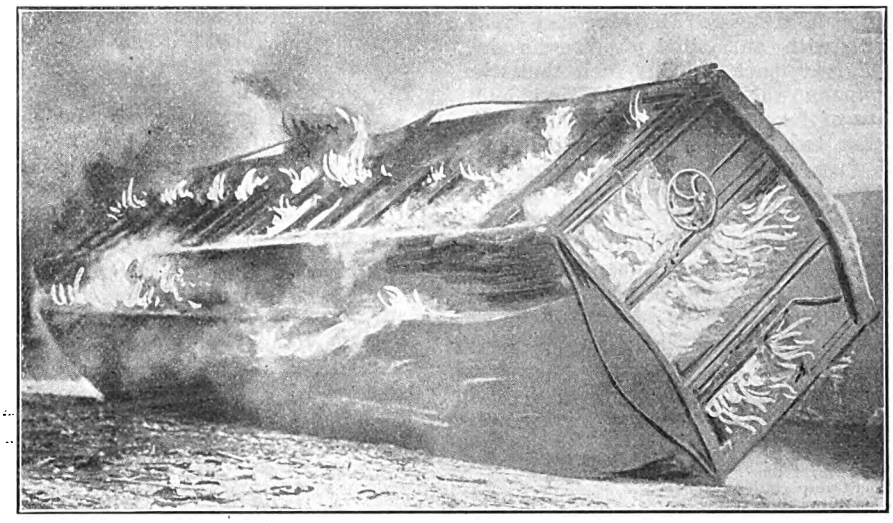
You are hereby notified by the Steubenville, East Liverpool & Beaver Valley Traction Company as follows:

1. That on May 1, 1922, at midnight the existing contract under which you are now employed by this company will terminate.
2. That this company refuses to be further bound by any of the provisions of the agreement under which you are now employed by it.
3. That with respect to the further employment of yourself, this company will take up and discuss such further employment with you, or with you and other employees representing yourself or yourself and others constituting the whole number of employees of this company or any part or group thereof at any satisfactory time which discussion may be had with C. A. Smith, but no discussion will be had with any officer or representative of any so-called labor union as the representative of such a labor union.

You are invited at your earliest convenience to take up the matter of further employment with this company as it is the belief of this company that a satisfactory basis for your further employment can be agreed upon.

1,850 Old Cars Scrapped and Burned at Boston

Until recently it had been a frequent comment of visitors to Boston that more old style street cars were in evidence there than in any other city of the country. But the last two years of trustee management, with a fare unit adequate to write off obsolete equipment, has changed all that. From July 1, 1919, to Dec. 31, 1921, 1,850 old cars of the Boston Elevated Railway have been scrapped and consigned to the flames of a gigantic funeral pyre at the Forest Hills yard. Rolling stock of modern type has replaced these old cars.



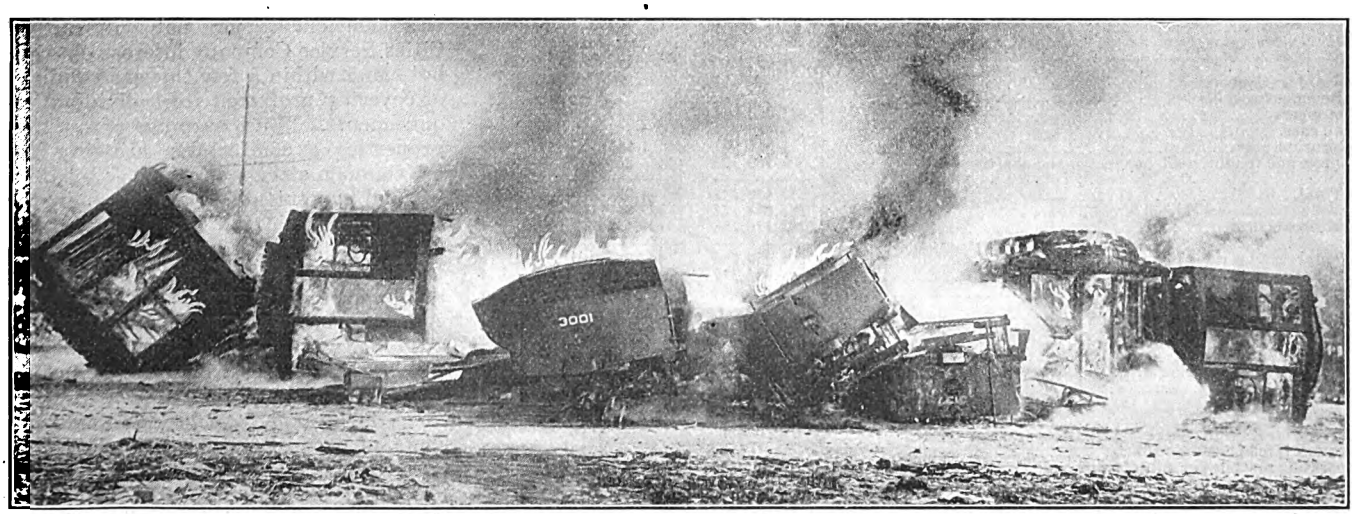
CLOSE-UP OF "L" CAR IN FLAMES

Under the strict regulations of the Massachusetts laws and the supervision of the commission, a street railway may not scrap any physical property without writing it off out of earnings. This necessarily involves the use of an actual cash depreciation charge against earnings and few of the companies have been financially able to charge off the value of obsolete cars. Consequently they have had to keep them. It is only within the last two years that the Boston Elevated has been able to rid itself of the burden of depreciated and inefficient rolling stock.

Most of these old cars had seen twenty-five years of service, and not a few of them three decades. Some were originally horse cars, which were spliced together and equipped with motors when electricity displaced the straining steeds of the '80s. Among the cars destroyed were fifty of the first wooden rapid transit cars used on the elevated lines.

The surface cars destroyed were single and double-truck box cars, 25 and 30 ft. types respectively, also a number of single and double-truck open cars. In their stead, center-entrance multiple-unit cars operated singly and in trains of two and three units are now in service. The company also has put a number of standard one-man safety cars in use in the suburbs.

Before being sent to the Forest Hills yard, the cars to be destroyed are stripped of everything of any possible value, all copper and brass trimmings being removed. After the conflagration, the ashes are raked for iron and metal scrap, which is stored until a favorable opportunity for sale occurs.



CARS BEING BURNED IN BATCHES IN BOSTON

Financial and Corporate

Surplus in Cleveland

Continuous Decrease in Riding with the Maximum Rate of Fare—Increase of Stockholders

According to the annual report of John J. Stanley, president of the Cleveland (Ohio) Railway, the company during 1921 earned expenses, taxes and interest. The number of passengers decreased greatly, but the city lessened the service and the company was able to give the service demanded without suffering a loss. Finishing the year 1921 with an actual profit was due in great part to the fact that the company was collecting the maximum rate of fare under the Cleveland ordinance, to adjustments made in the rates of fare collected in other municipalities, wage reductions in all departments, a lowering of the cost of materials and the slight improvement in general business conditions. The report was referred to in the ELECTRIC RAILWAY JOURNAL in the issue of Feb. 11, page 252.

At the close of the year there were 5,808 stockholders, an increase of 277 over 1920. Of this number 5,219 were residents of the state and 3,935 of the county. The report says that the range of prices of the company's stock on the Cleveland Stock Exchange for the past three years, while not indicative of the value of the stock, does emphasize the duty of the city to take some action that will place the market value of the stock above par and maintain it there. In 1919 the range was from 97 to 102; in 1920 from 87 to 100⅜, and in 1921 from 84½ to 93¼. The last sale during 1921 was 86.

The betterments during 1921 were so small that they could be paid for with the money realized from the retirement of obsolete property or, in two instances, paid for by private individuals interested in having them made. In the matter of track renewals the company made a record, completing 28.6 miles of track, the largest amount in any year on this system.

On Jan. 1, 1921, the wages of employees in the maintenance of way department were reduced approximately 20 per cent and employees in the maintenance of equipment department were reduced 10 per cent. On Feb. 1 the wages of all employees except those in the train service and in the above-mentioned departments were reduced 10 per cent. At the same time a bulletin was addressed to the trainmen announcing a reduction of 15 cents per hour and the elimination of all spread and overtime rates. This was followed in March by counter demands of the men and by a series of conferences with their committee during April, but an agreement was reached without recourse to arbitration or without any serious controversy. A new wage scale with the conductors and motormen was made effective on May 1 last which is substantially a 20 per cent decrease over the previous wage scale.

Mr. Stanley quoted at length from a report of City Street Railroad Commissioner Fielder Sanders made to the City Council on Dec. 14, which is a historical review of the past six years of operation and "should be of especial interest to every stockholder for its analysis of the financial and service conditions of the company."

In conclusion Mr. Stanley referred to the death of Henry J. Davies and gave a brief sketch of the man who he said was an authority on the accounting for street railways and on insurance in connection with street railways.

INCOME ACCOUNT THE CLEVELAND RAILWAY BASED ON ACTUAL EXPENDITURES

	1921	1920	Per Cent Change
Passenger revenue*	$17,336,685	$17,072,999	1.5
Other transportation revenue	81,536	130,668	—37.7
Other railway operations	189,497	178,691	— 6.1
Total operating revenue	$17,607,718	$17,382,358	1.3
Way and structures	2,013,810	2,109,294	— 4.5
Maintenance car equipment	1,723,407	1,949,887	—11.6
Maintenance power plant	75,630	59,021	28.1
Power operation	1,399,515	1,652,874	—15.3
Conducting transportation	6,037,904	7,042,945	—14.3
General and miscellaneous	2,171,286	2,252,030	— 3.6
Obsolete property	494,361	498,000	— 0.7

Cities Service Utility Properties Do Well

The annual report of the Cities Service Company, New York, N. Y., for 1921, shows net earnings of $10,846,585. This was 2.23 times the preferred dividend and after deduction of the preferred dividend was equal to $13.04 earned on the average common stock outstanding, as compared with $43.09 in 1920. Gross earnings last year were $13,461,770, as compared with $24,698,039 in the preceding year. Current liabilities were reduced $13,375,000.

The earnings of the public utility properties increased 50.8 per cent, or from $4,609,912 to $6,918,741. This was sufficient to pay not only all of Cities Service Company interest charges but came within a few thousand dollars of covering preferred stock dividend requirements. With earnings from oil properties a comfortable showing for the common stock was made.

Total current assets as shown in the balance sheet in the report were $42,438,113, as compared with total current liabilities of $18,532,347, leaving an ample working capital of $23,905,766. Accumulated earnings which have not been declared as dividends are shown as $47,013,011. During the year 11,565,993 barrels of oil were produced, and the company sold 86,133,082,000 cu.ft. of natural gas, 5,849,050.310 cu.ft. of artificial gas, 647,751,497 kw.-hr. of electrical energy and 95,274,280 passengers were carried on its electric railways.

Reorganization Terms Made Public

First Mortgage Bondholders Must Furnish New Cash to Participate in New Company

The Northampton (N. J.) Traction Company as the owner of the stock of the Northampton, Easton & Washington Traction Company, Easton, Pa., is apparently eliminated from participation in the reorganization of the company under the tentative plan which has been drawn by the committee representing the first mortgage bondholders. According to the members of that committee the operation of the Northampton, Easton & Washington Traction Company has shown that it cannot as now constituted earn money sufficient to pay fixed charges on the amount of bonds now outstanding and that it would be unwise again to place upon the company operating the property a burden of fixed charges in excess of any amount which can surely be earned.

In consequence the committee has proposed to allot to the present first mortgage bondholders that portion of the earnings only which remains after payment of operating expenses and taxes and necessary prior fixed charges and after setting aside proper amount for maintenance and depreciation. In order to accomplish this, an income bond has been decided upon as providing perhaps the best means to the end which the members of the committee have in mind.

It is the intention of the committee that the property shall be bid in in its behalf at the foreclosure sale. A new company will then be organized to which the entire property will be conveyed. In reorganizing it will be necessary to raise new money to pay for improvements, refunds, receivers' certificates, and to pay expenses of the committee. As the committee considers it impossible to raise such money from outside sources, the present bondholders will be called upon to subscribe to an issue of $100,000 of 7 per cent first mortgage bonds. Each bondholder will subscribe to an amount of these bonds equal to 20 per cent of his present holdings. In other words, each depositor of a $1,000 bond will subscribe for $200 of new 7 per cent bonds, for which he will pay $180.

The proposed authorized capitalization of the new company will consist of $1,000,000 of first mortgage 7 per cent bonds, $536,000 of 4 per cent sinking fund income bonds and 2,000 shares of stock of no par value. The amount of securities to be issued at this time will consist of $100,000 of first mortgage 7 per cent bonds, $444,000 of 4 per cent sinking fund income bonds and 2,000 shares of no par value stock.

The 2,000 shares of no par value stock will be held by the committee representing the bondholders. Each assenting depositor will receive for each $1,000 bond and $180 in cash, $1,000 of sinking fund 4 per cent income bonds and $200 of first mortgage 7 per cent bonds. No rights to the income bonds will accrue to any bondholder who does not subscribe for the new first mortgage 7 per cent bonds.

Control of Stark Electric Changes Hands

Purchase of a majority of the stock of the Stark Electric Railroad, Alliance, Ohio, has been made by a syndicate from Alliance and vicinity. The deal, which has been under consideration for several months, was concluded during the week ended April 8. The following Alliance men are interested: W. H. Purcell, F. E. Dussell, A. A. Reeves, S. L. Sturgeon, F. A. Graves, F. A. Hoiles, M. S. Melbourne, A. L. Atkinson, W. E. Davis, E. B. Webb, O. F. Transue, W. H. Ramsey, B. F. Weybrecht, G. R. Floyd and J. F. Heacock. The control of the road has been held by Cleveland capitalists since the organization, twenty years ago.

The Stark Electric Company was organized in 1903. It took over the Alliance Street Railway, the oldest electric road in the country. It first operated a line between Alliance and Canton, and shortly afterward extended the line to Salem. The company at present operates 34 miles of roadway. It owns its own right-of-way except in Alliance and the loop at Canton. The power plant of the company is located at Lake Park east of Alliance.

Renaming and Refinancing

In arranging the refinancing of the Hagerstown & Frederick Railway, Frederick, Md., to meet obligations maturing this year, the name will be changed to the Potomac Public Service Company. Because of its operations extending now into Virginia and West Virginia it is desired to have a corporate name more in keeping with the company's activities and to bring about a closer combination of all its various subsidiaries into one big corporation.

In its new refinancing Hambleton & Company, Baltimore, and E. H. Rollins & Sons, New York, N. Y., will offer $2,155,000 of the company's first and refunding mortgage 7 per cent sinking fund gold bonds, dated April 1, 1914, and due April 1, 1944. The bonds are offered at 100 and interest yielding 7 per cent.

The bonds are part of an authorized issue of $10,000,000 and there will be outstanding after this issue $4,855,000. The bonds are redeemable on any interest date at 107½ up to 1935 and at 2½ less in each succeeding five-year period. The Potomac Public Service Company will have a capitalization of $1,512,950 in common stock and $1,625,000 in preferred, which will be used to take over the stocks of its predecessor corporation.

New Directors for Quebec Company

The board of the Quebec Railway, Light & Power Company, Quebec, Que., was largely changed at the annual meeting following the election of E. A. Robert, president of Montreal Tramways, to the presidency. Lorne C. Webster, retiring president, took the vice-presidency and other directors are George E. Amyot, Quebec; Adelard Turgeon, Quebec; D. O. Lesperence, Quebec; J. N. Greenshields, Montreal; H. G. Valiquette, Montreal; Col. J. E. Hutcheson, Montreal; K. B. Thornton, Montreal, and A. C. Barker, New York, and C. G. Greenshields, Montreal. Shareholders approved a by-law making the $100 par value common stock no par value.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over, except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen and conductors on street and interurban railways in the United States.

Chicago Surface Lines Has Biggest Year

Earnings Largest in History of Companies—Decrease in Riders Small Compared with Other Cities

The report of the Chicago Surface Lines for the fiscal year ended Jan. 31, 1922, discloses gross and net receipts greater than any earned heretofore in the history of the company. The figures are shown in the accompanying table. One of the notable things about the business of the Chicago Surface Lines has been that during the year 1921, when the traffic on many electric railway systems fell off very materially, riding in Chicago decreased only 2.4 per cent as compared to the total number of riders in the previous year. Another interesting item brought out in regard to traffic is that since 1910 the increase in the number of revenue passengers on all of Chicago's urban transportation systems has been 56.4 per cent, and of this increase 91.52 per cent has been on the surface lines.

In addition to the financial statement of the companies, the report touches very briefly on many operating matters. On the subject of employing trainmen it is pointed out that during the year 10,810 men applied for train service. Of these 4,808, or 45 per cent, were allowed to file applications; of these, 1,114 were tentatively accepted as students, and of these, ninety-eight were rejected by medical examination. A tabulation is included which shows that 101 employees have been in continuous service with the company for forty years or over, 198 for thirty-five years or over, 447 for thirty years or over, and 481 for twenty-five years or over, making a total of 1,227 employees who have been with the company more than twenty-five years.

On July 28, 1921, the department of schedules and time tables was organized as a unit independent of the transportation department and reporting directly to the general manager. The work of this department is to make and revise the time-tables for the ninety-three different lines, nearly all of which require separate time-tables for week days, Saturdays, Sundays and holidays. During the year this department rewrote and revised 200 schedules for various purposes.

On the effect of the skip stop on power consumption, the report states that from studies made by the electrical department, it appears that the power saving due to the skip stop is from 15 to 18 per cent, and that if the skip-stop plan were eliminated, the company would not be able to operate the cars without additional power generating, transforming and transmitting equipment.

The power purchased from the Commonwealth Edison Company during the year amounted to 540,446,679 kw.-hr. The cost of this purchase power was $4,046,272. The total direct-current output at substations and power houses was 496,246,165 kw.-hr., the cost of which, including maintenance, fixed charges and purchased power, amounted to $4,459,102. The highest direct-current peak encountered was for 461,100 amp. on the morning of Jan. 24, 1922.

Another interesting item in the year's review is the mention that Marsh & McLennan were appointed general insurance brokers for the company and a $50,000,000 blanket insurance arranged on a new general form covering all buildings and their contents actively used in the operation of the road and all rolling stock, except the Seventy-seventh Street shops. A $3,000,000 Mutual Insurance Company policy was continued in force on these shops and their contents and rolling stock. A specific insurance policy of $2,579,613 was placed on buildings and their contents not used in the operation of the road.

The legal expense of the company during the year amounted to 2.87 per cent of the gross earnings, as compared to 3.28 per cent during the previous year.

CHICAGO SURFACE LINES — EARNINGS, EXPENSES AND DIVISION OF RESIDUE RECEIPTS FOR TWELVE MONTHS ENDED JAN. 31, 1921 AND 1922

More Passengers in Boston—General Results Better

The Boston (Mass.) Elevated Railway carried 1,193,657 more revenue passengers last month than during March last year, and revenues exceeded cost of service by $204,332.

During March the total revenue was $2,868,518, while in the same month last year it was $2,991,780, a decrease of $123,262.

The total cost of service last month was $2,664,186, as compared with $2,790,932 in March, 1921.

On April 1 the balance in the reserve fund created under the public control act was $919,863. The Elevated trustees expect that by May 1 this reserve fund will be restored to its original total of $1,000,000, and after that all receipts over cost of service must be paid over to the State to be distributed to the cities and towns that contributed to the loan assessment in 1919.

The number of 10-cent passengers carried last month was 24,765,577 as compared with 28,548,059 in March a year ago, but this loss was more than made up by the gain in 5-cent passengers, which were 6,130,322 last month and 1,147,316 in March, 1921. The grand total of revenue passengers last month was 30,895,899 and in March last year it was 29,695,375.

It is stated that the receipts from fares per revenue passenger last month were 9.005 cents and the total cost of service was 8.623 cents. Last year in March these figures were 9.804 cents and 9.399 cents, respectively.

Tennessee Plan Announced

Bankers Outline the Conditions Under Which Chattanooga and Nashville Properties Will Be Consolidated

Steps are being taken toward the formation of the Tennessee Electric Power Company to effect a consolidation of the companies controlled by the Tennessee Railway, Light & Power Company with the Chattanooga & Tennessee River Power Company. The properties of these companies have been operated as one system, and it is now proposed to bring them together as nearly as possible into one ownership.

The bankers concerned in the refinancing state that a sound basis will thus be provided for the funding of current floating debt and for the permanent financing of necessary improvements and extensions to the several properties as required to take care of their growing business. They explain that the first problem presented in making the necessary financial arrangement is to care for the large bonded indebtedness of the present operating companies.

Holders of the Tennessee Power Company's 5 per cent bonds, Nashville Railway & Light Company refunding and extension 5 per cent bonds and Chattanooga Railway & Light Company 5 per cent bonds are being offered their choice of several options in exchange for their bonds. When it is known to what extent such exchanges can be accomplished a supplementary plan will be submitted to the preferred and common stock holders of the Tennessee Railway Light & Power Company, stating the terms on which they may acquire the available securities of the new company in exchange for their preferred and common stock.

Tentative arrangements have been made, conditioned on the plan being declared operative, for the sale of first and refunding bonds of the new company for cash to investment bankers not heretofore identified with any of the properties.

It is explained that the Tennessee Railway, Light & Power Company controls the Tennessee Power Company, the Chattanooga Railway & Light Company and Nashville Railway & Light Company. Each of these companies has a floating debt, in some cases large, incurred for necessary betterments and improvements, for which it has been impossible to provide through sale of long-term securities. Because of the inability of these companies to finance their requirements, the Tennessee Railway, Light & Power Company has made large advances to them, borrowing the money for the purpose and pledging as collateral the bonds and stocks of the subsidiary companies held in its treasury, and these obligations have been renewed from time to time.

On or before June 1 next there will mature obligations of this company amounting to $3,561,000, and as collateral practically all of its assets are pledged. In addition the subsidiary companies have unfunded obligations amounting to $2,515,907 as of March 1, 1922, nearly all of which mature on or before June 1 next. It is further explained that under the circumstances it is imperative that steps be taken not only to provide for the present obligations of all of the companies, but also to remove the dangers of temporary financing by making provision for permanent financing of the necessary improvements and extensions to the several properties as required to take care of their growing business.

As a result of the careful study of all the conditions the best solution, so the bankers state, is a thorough readjustment of the securities of the company and its subsidiaries and the consolidation of them as outlined in the proposed plan. The details of the basis of exchange of the various securities are, of course, of interest primarily to the holders of the various securities of these companies. The capitalization of the proposed new Tennessee Electric Power Company would be divided as follows: Bonds, $32,947,500; preferred stock, $7,914,700; second preferred noncumulative stock of no par value, 50,000 shares; no par value stock, 150,000 shares.

Taxes Being Paid Up in Muskegon

Forty-three thousand dollars in back taxes will be paid on the installment plan by the Muskegon Traction & Lighting Company, Muskegon, Mich. The company has already paid $2,000 on account and its installments will be based on the revenue, it is announced by George Steinwedel, president and general manager. He hopes at least to continue the $2,000 monthly payments as the revenue is increasing.

Owing to bus competition the company lost money in the operation of its cars for two years. It then asked the Michigan Utilities Commission for permission to quit. The state commission made the order but suggested that Muskegon and Muskegon Heights, the two cities served, first vote whether they wanted railway or jitney service. Following a spirited campaign the cities voted four to one for street cars.

The company had been unable to pay its personal property taxes for two years and as soon as the revenue started to increase it decided on the installment plan. Figures submitted showed the buses on competing lines had taken $80,000 revenue from the railway.

The company is charging a 10-cent cash fare with four tickets for 30 cents.

Last February was the first month in more than three years that the company was able to meet both operating charges and interest. For two years the company is said to have failed by $50,000 to earn operating expenses.

There had been a marked feeling against the corporation in the two cities, but this sentiment quickly underwent a change when the company asked permission to discontinue service.

Financial News Notes

Opposes Abandonment.—The Bridgeton City Council has adopted a resolution opposing the expressed determination of the Bridgeton & Millville Traction Company, Bridgeton, N. J., to abandon its lines at Bridgeton on July 1 because of the heavy losses sustained.

Receiver Named.—Joseph A. Yager has been named receiver of the Toledo & Western Railroad, Toledo, Ohio. The matter was decided by Federal Judge Killits, acting on the petition of attorneys representing the company's stockholders. He will work with the other receivers, J. Frank Johnson and Harry A. Dunn.

Another Step Taken Toward Reorganization.—The Chicago, Aurora & Elgin Railroad, Aurora, Ill., has applied to the Illinois Commerce Commission for permission to issue $11,000,000 of common stock for the purpose of acquiring the properties of the Aurora, Elgin & Chicago Railroad under the reorganization plan.

Foreclosure Step Confirmed.—Grayson M. P. Murphy, chairman of the committee representing the holders of the 4½ per cent bonds of the Interborough-Metropolitan Company, has confirmed the report that these bondholders are about to take steps for acquiring by foreclosure the $33,912,000 of Interborough Rapid Transit Company stock which since 1918 has been held as security for the bonds.

Passenger Decrease Noted.—For the three months ended March 31, 1922, the Philadelphia (Pa) Rapid Transit Company, after deducting charges, realized a net income amounting to $614,831, against $364,547 for the same period in 1921. There was a decrease in the traffic from 207,961,020 total passengers for the first three months of 1921 to 202,286,650 for the first three months of the present year. The decrease in passenger revenue was $386,398.

Prospects for Reorganization Better.—Receiver George Whysall said recently that he had been advised by Judge Merle Walker, Indianapolis, and Guy L. Emerson, Chicago, who represent the bondholders, that they are meeting with thorough co-operation in working out plans for refinancing and reorganization of the Springfield, Troy & Piqua Traction Company, Springfield, Ohio. They expect to be in a position to make a complete report within the next few weeks. At present the line is only in partial operation. Residents along the line have expressed themselves as willing to help in the refinancing move. The Erie Railroad in the past has been used by the road to transfer passengers and freight to and from Sprigfield and its nearest connection, 2 miles distant.

Traffic and Transportation

Petition for Fare Rehearing Denied

The Illinois Commerce Commission on April 14 denied the petition for a rehearing filed two days before by the Chicago Surface Lines in the 6-cent fare case. The companies have until April 30 to make their next move. It was expected they would seek protection in the courts against enforcement of a rate which they consider confiscatory.

The petition of the companies for a rehearing attacked every conclusion reached by the commission. They contended that the 5 per cent return allowed by the commission would be insufficient to meet even the interest on the outstanding bonds and notes and would prevent them from financing necessary capital improvements. They denied the charge that their operating costs are excessive because the only evidence in the case shows the costs per car-hour and per car-mile were lower than the average for twelve large companies.

The companies insisted that the commission has no authority to set aside the provisions of ordinances as to maintenance and renewal charges and that it would be a grave mistake to reduce these expenditures at a time when the property, built since 1907, is beginning to need more repair and replacement. Also they attacked the section of the order which would prevent further payments into the injuries and damage reserve fund, and they stated the commission has no power to deduct from operating expenses the cost of sweeping, sprinkling and cleaning streets.

The Chicago Surface Lines filed a petition in the United States District Court on April 18 for a permanent injunction against the 6-cent fare order. The plea was made on the ground that the proposed rate is confiscatory. Judge Page set a hearing for next Monday afternoon, at which time he will decide whether he will grant a temporary restraining order to serve until the court can hear the case completely.

Plans Made to Develop Waterway Traffic and Shipment by Electric Railway

The Louisville (Ky.) Railway and the Interstate Public Service Company, the latter operating the interurban lines north through Indiana from Louisville, are destined to play an important part in the revival of Ohio River transportation. President James P. Barnes, of the Louisville Railway, is chairman of the executive committee and director of the new Inland Waterways Company, and Harry Reid of the Interstate is a director. The new corporation is chartered with a capital of $1,000,000. Plans call for bringing freight to Louisville from upper river points as far off as Pittsburgh and reshipping or distributing from Louisville by steam and electric railway.

The drawback to river shipping in the past has been found in the fact that so many large plants are located inland. This means that to move the river shipments to these plants after the materials reach city destination resort must be made to very expensive drayage. However, if plans now being made are worked out to completion it is probable that the Louisville Railway will not only transfer freight from river barges and boats to freight cars for delivery to its interurban lines, but will also transfer to plants located on city car lines.

Through proper co-operation the interurbans will be able to secure materially increased tonnage and will be in position to aid the waterways companies in forcing the steam lines to play the game.

Service Restored in Augusta on April 15

Appeal for Relief from Unfair Jitney Competition Heeded, but Company Reserves Right to Withdraw Cars Again if Experiment at Regulation Fails

Electric railway service was resumed on April 15 in Augusta, Ga., by the Augusta Railway & Electric Corporation, after a suspension of just a month. The City Council and Charles S. Banghart, general manager of the company, came to terms on April 12 at a special meeting of the Council. The action under which the jitneys will now be regulated was concluded behind closed doors. The agreement was reached after less than an hour's deliberation.

UNDER the agreement Council will so regulate the jitneys that they shall not be permitted to take on or discharge passengers nearer than one block of the street car lines. It will also prevent the jitneys from crossing Broad Street except at the intersection of Broad and Fourth Streets and Broad and Fifteenth Streets. The railway agrees to a 7-cent token fare to be sold in multiples of five, will charge the casual riders 10 cents and sell school children and teachers tickets at 5 cents, as heretofore.

The agreement was reached when Mr. Banghart, representing the corporation, accepted the terms presented in a resolution coming from the finance and special traffic committee of Council. This resolution was amended at the session of Council on April 12 by a substitute presented by Councilman C. Vernon Eliott and was adopted.

The original resolution from the committee and the Eliott substitute follow:

ORIGINAL RESOLUTION

Whereas, in the opinion of the City Council of Augusta it is necessary to further regulate jitneys in the city of Augusta, as a traffic regulation in the exercise of the police power of said city; now, therefore, be it

Resolved, That the police committee of the City Council of Augusta be, and it is hereby authorized and directed to so regulate the jitneys now licensed by the City Council of Augusta as that they shall not be permitted to take on or discharge any passengers nearer than one block of any street car line of the Augusta-Aiken Railway & Electric Corporation, and further to so regulate said jitneys as to prevent their crossing Broad Street, except and alone at the intersection of Broad and Fourth Streets, Broad and Twelfth Streets and Broad and Fifteenth Streets.

(Amended)

SUBSTITUTE RESOLUTION

Whereas, in the opinion of the City Council of Augusta it is necessary to further regulate jitneys in the city of Augusta as a traffic regulation in the exercise of the police power of said city; now, therefore, be it

Resolved, That the police committee of the City Council of Augusta be, and it is hereby authorized and directed to so regulate the jitneys now licensed by the City Council of Augusta as that they shall not be permitted to take on or discharge any passengers nearer than one block of any street car line of the Augusta-Aiken Railway & Electric Corporation, and further to so regulate said jitneys as to prevent their crossing Broad Street, except and alone at the intersection of Broad and Fourth Streets and Broad and Fifteenth.

2. Resolved further, That in restarting its cars the status quo ante existing between the city and the Augusta-Aiken Railway & Electric Corporation, with respect to the rights, privileges, duties and obligations belonging to or imposed upon either the city or the company, shall be and remain the same as they were prior to March 15, 1922, provided nothing herein contained shall be construed as in any way enlarging the franchises granted to said railway company prior to March 14, 1922.

Adopted in open Council, this the 12th day of April, 1922.

In a letter to the Council dated April 12, Mr. Banghart agreed that if the Council passed the resolution presented to him the company "will assure the public that it will resume service in the city, charging 10 cents for the casual rider and will sell tokens at 7 cents in multiples of five, and sell school children and teachers tickets at 5 cents as heretofore."

Furthermore, the company agreed to resume and maintain not more than a fifteen-minute schedule or headway on all city lines. The company also agreed to maintain a seven-and-one-half-minute service on the Summerville line as far as Baker Avenue during the morning and afternoon rush hours.

Mr. Banghart indicated that the company was willing to try to operate under the conditions just outlined, but that it was obvious that it could do so successfully only with the full co-operation of the riding public. The company has pledged itself to do its best to make operation a success under the new conditions, but that it must remain free to exercise its legal rights and to stop cars again if after a reasonable trial the jitney competition as regulated under the new order still cuts into the railway company's legitimate revenue as reflected in the operating receipts and expenses.

New Loop Plan Suggested

The Board of Control of Steubenville, Ohio, in co-operation with various committees of the City Council has submitted a new loop plan to the City Council for all rail traffic within the city. The new loop plan eliminates five "dead-end" terminals in the city business district, provides for continuous operation of cars on all lines with elimination of loss of time for passengers and congestion on busy thoroughfares, makes Market and Adams Streets "one-way" streets for electric lines and in the opinion of officials, as near as is humanly possible, remedies inconvenience to the traveling public and congested traffic. Under the new plan, which is said to meet with the approval of the operating companies, universal transfers on all lines will be issued.

City Fathers Allow One-Man Cars

One-man cars, of the Birney type, similar to those which have been so successful in Tampa, will be permitted on the lines of the Jacksonville (Fla.) Traction Company, following the decision of the city fathers there to accept the recommendations of the laws and rules committee of the Council. The decision amends Section 5 of the existing ordinance which says that there shall be a conductor and motorman on each car.

The Jacksonville Traction Company, a Stone & Webster subsidiary, and now in receivership, had requested the city to eliminate that section of the ordinance regulating electric railway traffic that requires that a car crew shall consist of a conductor and a motorman.

According to E. J. Triay, receiver for the Jacksonville Traction Company, the installing of one-man cars in Jacksonville will not mean that the number of carmen now employed by the traction company will be reduced. The men will merely be assigned to different cars, thereby increasing the car service.

Hopeful That Traffic Will Increase

The maximum decline in the number of passengers transported by the Cincinnati (Ohio) Traction Company has passed, according to William Jerome Kuertz, Director of Street Railways, who has just completed compilation of figures for the first three months of 1922. Director Kuertz said that while the number of passengers was less for the first three months this year as compared with last year, the bottom of the depression has been reached and the trend is upward.

In January this year there were 8,932,704 revenue passengers as compared with 9,093,024 in January, 1921. In February, 1922, there were 8,071,061 and in February, 1921, 8,208,261. March showed an increase to 9,098,342. In March, 1921, the number was 9,238,402. Director Kuertz said that the percentage of difference is being overcome from month to month and at the present rate the traction company will exceed last year's figures and will be on a fair way to equalizing the record of 1920.

Hearing on Lower Fare—Decision Reserved

James T. Manee was the only signer of the petition to the Public Utilities Commission for a reduction of fares at Hartford, Conn., to 5 cents who appeared at the hearing on April 18 in the Capitol in support of the petition. The Connecticut Company was represented by President Storrs and Attorney Joseph Berry. Commissioner Elwell conducted the hearing alone. The commission reserved its decision.

Mr. Manee declared the people of Hartford did not consider the three-tokens system a satisfactory substitute for a flat rate of 5 cents. He knew that the commission had given consideration to the 5-cent proposition and he did not come to the hearing with figures in support of the petition. He would not favor the petition if the granting of it would have a tendency to reduce the wages of the trolley company's employees. The people traveling on the cars felt that a 10-cent fare was burdensome.

President Storrs said that before the war the payrolls of the company amounted to $4,000,000 annually. At the present time the payrolls amount to $7,000,000. Coal and materials have doubled in price. A 5-cent fare was beyond a possibility. By the reduction of fares in Hartford 16 per cent the company contributed $50,000 in the month of March to the cost of living in Hartford. About 90 per cent of the people of Hartford took advantage of the reduction by buying tokens.

Emergency Ordinance Passed

The City Council of Akron, Ohio, on April 18 passed an emergency ordinance granting the Northern Ohio Traction & Light Company a 5-cent fare until the expiration of the present 4-cent fare franchise Feb. 1, 1924. The new franchise provides that the company must lay tracks on North Main Street over the North Hill Viaduct, on a portion of West Market Street, and install eight new buses as feeders to present traction lines. The ordinance provides the work must be completed with ninety days after the company is notified.

The company has been receiving a 5-cent fare under ordinances passed from time to time for the last year and a half. The passage of the present ordinance clears the situation for an agreement. It is expected that a permanent contract will be agreed upon during the next few months. While the franchise passed is subject to a referendum within the next sixty days, it does not appear at this time that a referendum will be called for the reason that the public attitude toward the company is such that a referendum would merely ratify the action of the Council.

New Service to Start

Arrangements have been completed for a two-hour through limited interurban service between Akron and Warren, Ohio, to begin May 1 over the Northern Ohio Traction & Light Company and the Cleveland, Alliance & Mahoning Valley Railway lines with connections at Ravenna for Alliance. Tickets will be sold through from Akron to Youngstown, using the Pennsylvania-Ohio Electric line beyond Warren, where transfer will be necessary for the present.

The first train leaves Akron Terminal, eastbound, at 6:50 a.m. and every two hours until 4:50 p.m. The first train leaves Warren, westbound, at 6:45 a.m. and every two hours until 4:45 p.m. The schedule running time is one hour and fifty minutes each way. New steel cars will be used.

Trains will stop at Chalkers Landing, Cuyahoga Falls, Silver Lake, Kent, Brady Lake, Ravenna, Wayland, Newton Falls, and Leavittsburg. Eastbound trains stop only at Wayland and Leavittsburg to discharge passengers, while westbound trains stop at these two points only to pick up passengers.

Will Report Traffic Violations

A number of traffic changes are in the making at the present time in Louisville, Ky. One act which will probably be passed will prohibit autos passing street cars on the left side when both auto and vehicle are moving in the same direction. Just recently there was a bad smash when an auto was caught between two cars moving in opposite directions and three people have been in the hospitals for some time as a result. An ordinance prohibiting parking for more than fifteen minutes in the downtown district is now before the board.

Through the efforts of the Louisville Safety Council and the Automobile Club several hundred prominent men, including many motorists, have been appointed members of the Citizens' Police Auxiliary Committee, these members reporting all traffic violations which they see, especially cases where automobile owners pass standing street cars. Members of the auxiliary committee have received fresh identification cards.

Hearings Started.—High percentages of overloading during the rush hours on the Myrtle and Marcy Avenues stations and on the Canarsie line were disclosed on April 17 when the Transit Commission began its investigation of service on the subway and elevated lines of the Brooklyn Rapid Transit Company. Statistics were presented by W. K. Edgerton, the commission's assistant supervising inspector. Clarence J. Shearn, chief counsel to the commission, said that conditions would be different if the city had put the Fourteenth Street Eastern District subway in operation. The investigation was adjourned until April 24.

"Weekly Pass" in Meadville, Pa.

You can now ride whenever you like and as often as you like in Meadville, Pa., for $1 a week. The new arrangement, which is the "weekly pass" plan, is the result of a conference between a committee appointed by the Chamber of Commerce and Charles M. Hatch, vice-president and general manager of the Crawford County Railways, operated under lease by the Northwestern Pennsylvania Railway. Mr. Hatch recently wrote to the Chamber of Commerce stating that owing to the decrease in riding the company was considering some way of readjusting the rates or increasing the traffic in the city. A committee was then appointed and at a conference held on March 30 it was brought out that the business of the company had decreased 20 per cent below the same months of 1921 and that the company proposed to put on sale a reduced ticket rate.

The 10-cent cash fare or ticket plan will still be in effect. It is said that the tickets are transferable but are not good on interurban cars. This "weekly pass" plan is the same as in effect in Youngstown, Fort Wayne and other cities of moderate size.

Extension of Freight Service Announced

A new avenue for the shipment of freight to and from Cleveland, Akron, Massillon, Canton and other points has been opened by the Northern Ohio Traction & Light Company, Akron, Ohio Through the establishment of this service there will be an early morning distribution of freight from Cleveland to all points on the Northern Ohio Traction & Light, Mahoning Valley, Pennsylvania-Ohio Electric, Stark Electric and other roads with which negotiations are now in progress. Arrangements have also been practically completed for the handling of freight from every point on the Northern Ohio Traction & Light to other cities and states via several steam lines. Rates will be the same as on steam roads.

A freight house has been established at 725 Eagle avenue, near Ninth street and Euclid Avenue, which is in the center of the city's business district. Northern Ohio Traction & Light cars will be switched to this freight house and loaded. The extension of freight service has necessitated the establishment of new freight depots, outside of Cleveland, in Ravenna, Barberton, Massillon, Dover and New Philadelphia.

Petition for Lower Rates

J. P. Jones has filed a petition with the Georgia Railroad Commission asking for a reduction of the fares to 5 cents on the Rome Railway & Light Company's lines. Various charges are made against the railway in the petition, which states that after the reductions are sought in railway fares and in light and power rates it would still be possible for the company to earn fair returns on the capital invested. The petition was filed in Atlanta and May 26 has been set for the hearing by the commission.

Transportation News Notes

Will Determine Fares.—The City Commission of Fort Smith, Ark., has promised a thorough investigation of the earnings of the Fort Smith Light & Traction Company for the purpose of determining whether the company is to return to a 5-cent fare.

New Plan to Become Effective.—The skip-stop system will shortly be started on electric railway lines in Oklahoma City, Okla. Announcement to this effect was recently made by J. W. Shartel, vice-president of the Oklahoma Railway. The skip-stop plan is already in use on one of the Oklahoma City lines.

Will Appeal Rate Decision.—The Nashville Interurban Railway, operating between Nashville and Franklin, Tenn., has announced through its officials its intention of appealing the decision of the Public Utilities Commission in regard to its rates. The order of the commission reduced the passenger rate from 10 cents to 4 cents.

Five-Cent Fare Orders Issued.—Officials of the Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio, recently announced the return of the 5-cent fare on local lines. The lower rate instead of the three-fare zone system is the result of a decision of the Federal District Court.

Merchants Oppose Rates.—Merchants of Wheeling, W. Va., working with a committee of the Chamber of Commerce, are planning to take action soon to force a reduction in rates of the Wheeling Traction Company and the Wheeling Public Service Company. Retail merchants claim that the alleged high rates keep out business from the Ohio district.

Interurban Adopts Daylight Saving.—Despite the fact that the city of Springfield, Ohio, rejected a proposal to establish daylight saving in the city at a referendum, last fall, the Indiana, Columbus & Eastern Traction Company will operate trains on the advanced time effective April 30 to Oct. 1. Springfield is one of the few cities on the traction line that does not operate on advanced time during the summer months. Moreover, connecting lines operate on Daylight Saving time during the summer.

Use of One-Man Cars Being Extended.—One-man cars have been introduced by the International Railway, Buffalo, N. Y., on several local lines in the city of Niagara Falls and there has been an extension of the one-man car service in Buffalo. The company has been operating one-man cars in Lockport for several years. In Niagara Falls, where the company had been operating cars on certain lines on a forty-minute schedule, one-man cars are being operated under a twenty-minute headway.

New Rules for Car Operation.—Under a new ordinance adopted by the City Commission of Trenton, N. J., electric railway companies operating within a radius of three-quarters of a mile from the center of the city of Trenton are prohibited from allowing cars to stand for a longer period of time than is reasonably necessary for receiving and discharging passengers. Trolley companies are also prohibited from allowing two cars to stand side by side at any terminus for any period of time whatsoever.

Zone Ticket Machine to Be Installed.—Shanklin Equipment Company, Springfield, Mass., has contracted with London Tramways, Ltd., to supply a machine for issuing zone tickets and adding fares automatically, and the first lot of machines was shipped to England, April 14. The use of the machine is said to be an experiment and the outcome will have a bearing in determining if it is feasible to install one-man tram cars to replace the buses so extensively in use in that city. Alfred L. Chase, chief of the Shanklin Company's mechanical organization, is going to London to install the machines.

Contract with Public Trustees Must Stand.—Attorney-General J. Weston Allen of Massachusetts has rendered an opinion in which he declares unconstitutional some fourteen bills submitted to the Legislature by residents of Boston having for their object the restoration of the 5-cent fare on all lines of the Boston Elevated Railway and the Eastern Massachusetts Street Railway. According to Mr. Allen the contracts must stand which were made in 1918 providing for the operation of these roads under a board of public trustees. The bills were introduced as a result of the pre-election promises of Mayor Curley.

City Will Take No Action.—Announcement has been made that no action will be taken by the city of Erie, Pa., in the matter of the recent ruling of the Public Service Commission in refusing to make mandatory recommendations for a reduction in fares in the city until official notice of the ruling has been received by the city. The Public Service Commission over a year ago recommended that fares on the Buffalo & Lake Erie Traction Company be reduced in the city. Such recommendations have been ignored by the company and the council petitioned the commission to make the recommendations mandatory. The Public Service Commission has declined to do this, on the ground that the operating expenses of the company are such as not to permit a reduction in fares.

Personal Mention

Oscar Terry Crosby

Germans Listen Attentively to Outspoken American Who Advises Them to Clean House Financially

Oscar Terry Crosby, publicist, economist, explorer, engineer and electric railway executive, has been indulging in his favorite pastime again. He has been on another investigation. Mr. Crosby is always investigating somebody or something. The difference between Mr. Crosby and your ordinary investigator is that when Mr. Crosby investigates anything he goes to the bottom of it, with permanence in view as the outcome of such recommendations as he may make.

Just now Mr. Crosby happens to be in Germany, but he would be equally at home most anywhere else in the wide world. According to newspaper accounts, the former Assistant Secretary of the United States Treasury—for this is one of the many posts Mr. Crosby has held—has startled the German optimists by the candid manner in which he set forth the conditions which any conservative leader would obviously impose before diverting his capital to the field of government or large private loans in Germany. But that isn't all. Among other things he has proposed to the Germans a determination of the theoretical value of the paper mark, based on the average index figures and exchange rates during the era of inflation.

The Germans are not the only ones Mr. Crosby has shocked. He does not think that others have been very much nearer to being correct or less free from economic sins than have the Germans. He is of the opinion that the Reparations Commission has been negligent in making demands without requiring the one step which would permanently put its debtor in a position to make orderly payments in the future. This step, he explains, is the establishment of sound currency. His plan is one of the fruits of his direct study on the ground, but has its real basis on knowledge gained previously.

It will probably be recalled that Mr. Crosby was formerly resident manager in Belgium of the work of the American Commission for Relief in Belgium and Northern France and that late in December, 1917, he represented the United States at a meeting of representatives of all the Allies held in London to discuss the industrial and economic situations. And thus it goes.

Money has been a means to the end with Oscar Crosby, never the end. Long before Edward Bok and others began to preach the doctrine of letting younger men take over the active reigns of business, Mr. Crosby had put aside all thought of active participation in business affairs in order that he might devote himself to his avocations and to the public service. The safe guess would be that Mr. Crosby has worked harder since 1914, when he entered the public service, than he ever did before. That, indeed, is saying a great deal when proper weight is given to the many business interests of the man in the pioneer days of the electric railway industry. Mr. Crosby is in many respects a marvel. That sounds big and imposing. Well, it is meant to sound that way. And what is more, it is a fact.

Enter Safety Director Koehler

A. W. Koehler has been appointed director of safety of the New York State Railways. He is a newcomer in the electric railway field, but he has had an extended and successful experience in safety work. For two years previous to joining the staff of the State Railways Mr. Koehler was executive secretary of the Rochester Safety Council, which is affiliated with the National Safety Council. During the previous five years, with the exception of a period of war service in the engineering department of the Navy, he was engaged in safety work with the Commonwealth Steel Company, Granite City, Ill., and the Atlantic Steel Company, Atlanta, Ga.

A. W. KOEHLER

Mr. Koehler graduated in mechanical engineering from Purdue University in 1915. His experience since graduation has convinced him that the field of industrial accident reduction is a promising one for young engineers. He visualizes a great opportunity on the New York State Railways, in spite of the fact that that company has been one of the pioneers in this field.

P. L. Hatch is now general manager of the Glendale & Montrose Railway, Glendale, Cal. He was formerly superintendent and purchasing agent.

F. W. Gerlach has been appointed general agent of the newly created freight department of the Northern Ohio Traction & Light Company, with headquarters in Cleveland. C. J. Laney, traffic manager, will have complete supervision over the new department.

Harry Reid, president of the Interstate Public Service Company, which owns and operates the Indianapolis, Columbus & Southern Indiana Traction Company and other public utilities in Indiana, has been elected president and also a member of the executive committee of the Great Lakes division of the National Electric Association. The Great Lakes division is made up of Illinois, Wisconsin, Michigan and Indiana. The division will hold its annual convention at French Lick in September.

C. D. Cass, general manager of the Waterloo, Cedar Falls & Northern Railway, Waterloo, Iowa, some weeks ago addressed the annual convention of the Iowa Engineering Society at Sioux City on the steam railway situation. Mr. Cass was one of the managers under federal operation during the war and knows the difficulty now faced by the railroads. He said the roads are so hedged about by restrictive regulations and regulatory bodies that they do not and cannot respond promptly enough to economic changes and conditions. He pointed out that the railroads are subject to a host of masters—the United States Congress, the Interstate Commerce Commission, forty-eight state legislatures, forty-eight state railroad commissions, hundreds of county governments, thousands of city governments, untold numbers of health officers, township trustees, highway commissions, road supervisors, and what not—because each of these governmental agencies has the absolute power to compel a railroad to make expenditure of money under authority of law. The address was well received.

Obituary

William J. Armstrong, assistant treasurer of the Gould Coupler Company, New York, died suddenly at his home in Brooklyn some time ago. Mr. Armstrong had been connected with the company for the past twenty-five years.

John H. Campbell, treasurer of the Interborough Rapid Transit Company, the Interborough Consolidated Corporation and the New York Railways, New York, N. Y., died April 5 at Garden City, Long Island. Mr. Campbell gained political importance during the régime of Richard Croker, and served as his private secretary when Mr. Croker was Tammany leader. For some years before he became secretary of the traction companies, Mr. Campbell was deputy city chamberlain, leaving that work in 1908 to take up his duties with the Interborough.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Railway Business Is Increasing

We find it necessary this week to devote more space than usual to information on business and market conditions. Reports of track reconstruction and extension have been increasing daily and purchases for power and rolling stock equipment indicate a steady increase. Reports from the Department of Commerce on foreign conditions show an increased demand for American products, and in other closely allied lines there is indication of a continued though slow resumption of business.

Some Figures on Coal Production

Complete returns of coal loaded into cars at the mines indicate that production during the first week of the strike was 3,784,000 net tons of bituminous coal and a few cars of anthracite dredged from the rivers. The total production of all coal was 3,793,000 net tons. In the first week of the great strike of 1919 only 3,582,000 tons of bituminous coal were produced, but at that time the anthracite mines were working to capacity and produced 2,008,000 tons. The total production of all coal in the first week of the 1919 strike was therefore 5,590,000 tons. Preliminary telegraphic returns for the present week indicate no change in anthracite, but a slight decrease in the output of bituminous coal.

The current production is less than the districts now at work are able to produce when the demand for coal is active. It is true that a number of important non-union mines in the Connellsville coke region and in central Pennsylvania have been closed by the strike, but the existing demand is not sufficient to call out full production in those districts remaining at work. From mines in many non-union fields reports of "no market," "dull demand" and "unbilled coal" continue to be received. The number of loaded cars unconsigned at the mines was very large when the strike began, but the latest reports from the railroads show that it is increasing rather than decreasing.

New Director of Industrial Relations for Schenectady Plant

G. H. Pfeif, has been appointed director of industrial relations at the Schenectady plant of the General Electric Company, succeeding E. B. Merriam, who recently became executive engineer of the Switchboard Department. As director of industrial relations he will have supervision over the employment, education and training, compensation, hospital and safety work of the Schnectady plant.

Mr. Pfeif has been with the General Electric Company since 1905 and for the past several years, as secretary of the committee on student affairs, has been in charge of the selection and placement of technical graduates in the student engineering courses of the Company.

Railway Electrification in Switzerland

The general management of the Swiss Federal Railways has requested the Administrative Council to approve of the plan for electrification of the Lucerne-Olten-Bale line (92 km.) and to provide it with a credit of 28,300,000 francs to purchase the necessary installations, materials and tools. The management also requests that it be permitted to alter the present construction plans at its own discretion whenever the present credits might be greatly surpassed.

German Rails and Steel Poles for Edinburgh

The Edinburgh Tramways Committee, by a majority, has recommended the acceptance of the quotation of a German manufacturer in Cologne for 130 tons of tramway rails and 5 tons of fish-plates. The German firm quoted, through its British agent, £1,365, and the nearest British offer was £1,495. The German figure, on a basis of $4.40 to the pound sterling, would be equivalent to $33.37 a ton.

The Edinburgh committee also unanimously agreed to accept the tender of another German firm for steel poles. The British quotation was £7,977, as against £5,436 by a Düsseldorf firm.

More Electric Railway Extensions Planned for London

Late developments of the project for certain extensions and improvements of the London Underground Railways show that the trade facilities committee of the government has reported favorably on the plans which have been proposed and has recommended that the government guarantee the principal and interest upon a sum not exceeding £5,000,000 for this work. Press comments state that there is every reason to believe that the recommendation of this committee will be accepted and that the guarantee will be given. A survey of the situation is being made for the U. S. Department of Commerce by a representative at London of the Bureau of Foreign and Domestic Commerce, and further details relative to the commencement of this work are expected soon.

Western Electric Reports Earnings of $10,166,337

The net earnings of the Western Electric Company in 1921 were $10,166,337, compared with $8,277,414 in 1920. This increase in the face of a drop in gross sales from $206,112,000 in 1920 to $189,765,000 is attributed to a thorough readjustment and reduction of expenses. The balance carried to the common stock after payment of interest and dividends was $823,997. The unfilled orders of the company at Dec. 31, 1921, aggregated $75,525,000, as compared with $82,655,000 at the end of the year 1920 and $47,442,000 at the end of the year 1919.

C. G. Du Bois, president, says:

A survey of the prospects for 1922 indicates that the business in the company's products will be about the same in quantity as 1921, but somewhat less in money value, due to the lower price level at which the product will be sold.

Rapid Transit Proposals Made in Los Angeles

The Pacific Electric Railway, Los Angeles, Cal., has just made application to the City Council for a franchise to operate trains through a tunnel which it is proposed to bore between Hill Street Station and Glendale Boulevard. According to reports, work on the project can be started immediately after the granting of a franchise. It is expected that two years would be necessary to complete the work.

The proposed tunnel will cost approximately $1,850,000 and will be approximately 1 mile in length. Such a tunnel will remove a car a minute from the North Hill Street line, where conditions are very congested. At the same time the scheduled speed could be increased considerably and at least fifty grade crossings would be removed.

Railway Electrification in Java

The estimates made in the Netherlands Indian budget for the electrification of the railways of Java have been accepted, but no time has been set for the beginning of the work. A German concern has recently sent a special representative to Java for the purpose of studying the plans and making competitive bids on machinery and the necessary supplies.

Metal, Coal and Material Prices

Metals—New York	April 18, 1922
Copper, electrolytic, cents per lb.	12.875
Copper wire base, cents per lb.	14.125
Lead, cents per lb.	5.125
Zinc, cents per lb.	5.25
Tin, Straits, cents per lb.	31.125
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.75
Somerset mine run, Boston, net tons	2.25
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	2.75
Central, Ill., screenings, Chicago, net tons	....
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y. cents per lb.	5.90
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$1.97
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	88.00
White lead, (100-lb. keg), N. Y., cents per lb.	12.25
Turpentine (bbl. lots), N.Y., cents per gal.	86.00

Rolling Stock

West Penn Traction & Water Power Company, Pittsburgh, Pa., during 1921 added nine cars of double-truck type to the Coke Region Division rolling stock and ten cars of the double end double-truck type to the McKeesport Division.

Western Ohio Railway, Lima, Ohio, has purchased ten new passenger cars lighter than cars now used. The new equipment will cost $250,000. General Manager Carpenter stated that later on, to meet competition of the motor bus, the Western Ohio will place in service passenger buses on the highways.

Pittsburg County Railway, McAlester, Okla., which owns and operates the electric railway lines in McAlester and also the electric railway from McAlester to nearby towns, has purchased and put in operation a new type of electric locomotive, built especially for its line at a cost of $25,000.

Chicago, North Shore & Milwaukee Railroad has requested bids on twelve new single-truck safety cars, ten merchandise dispatch cars and ten steel passenger coaches, all of which will be motor cars. There is a possibility that a larger number of cars may be ordered and that the specifications as to types of cars to be purchased may be changed. Types of equipment, and passenger car design, are under study and investigation at the present time.

Power Houses, Shops and Buildings

Toledo & Indiana Railroad, Toledo, Ohio, has purchased a site at Washington and Ontario Streets, Toledo, and will soon build there an interurban freight station. President L. P. Schenck has announced that the move was made necessary because of the indefiniteness of the present leases for the interurban union freight station in the downtown district. The Ohio Electric will use its own interurban station. Two or three other lines are negotiating for the right to use the Toledo, Bowling Green & Southern freight station, and some lines may also want to enter the Toledo & Indiana station for their freight business.

Holyoke (Mass.) Street Railway may have a joint waiting station with the Boston & Maine Railroad. At a hearing before the Holyoke Board of Public Works on March 11 on a petition to abolish the Boston & Maine passenger and freight stations at Smith's Ferry, the feasibility of this plan was considered. A plan to establish physical connection between the tracks of the two companies at this point is also under discussion. This would enable cars to be run from a nearby quarry onto the Boston & Maine without transferring the loads. Several plans to reduce the dangers arising from the grade crossing were considered.

Brooklyn, N. Y.—The $342,000 bid of F. L. Cranford for the construction of the Lawrence Street subway station on the Whitehall Street line of the Brooklyn Rapid Transit Company was found to be the lowest when the bids were opened before Leroy T. Harkness, a member of the Transit Commission. The terms of the contract provide that the station must be ready for operation in eighteen months from the time work is begun and must be entirely completed in twenty-four months. Work is to begin within thirty days of the date of the delivery of the contract. The bid next lowest was that of the Joslin Construction Company, $355,000. The highest was that of Pat McGovern, $502,000. There is already a platform at Lawrence Street, but it has never been used.

Track and Roadway

Montreal, Que.—At a recent meeting of representatives of the City Council and the Tramways Commission it was definitely decided to build a car line to the top of Mount Royal.

San Francisco - Oakland Terminal Railways, Oakland, Cal., has protested the extension of its Rockridge line on the ground that this improvement would necessitate a new switch at a cost of $5,000.

The Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y., is planning a program of improvement work on its lines in the city. Double tracks will be laid on some streets.

Georgia Railway & Power Company, Atlanta, Ga., will spend $220,000 on improvement work. On Marietta Street 122-lb. rail will be put in and 103-lb. rail on Decatur Street. These rails will be laid in a concrete roadbed.

Cincinnati (Ohio) Traction Company will start the work of putting in new rails on Hamilton and Eastern Avenues on May 1. These thoroughfares are equipped with double tracks and the new rails will be laid for a distance of 1 mile on each street.

Eastern Pennsylvania Railways, Pottsville, Pa., replaced much new track during 1921 and built a new siding at Port Carbon. Some of the overhead trolley wire was also replaced. During the year $399,719 was expended for improvements and extensions to the property.

Winona Interurban Railway, Warsaw, Ind., operating from Goshen, Ind., to Peru via Warsaw, is building a track connection with the Michigan division of the Big Four railroad at New Paris, 6 miles south of Goshen. The arrangement will also afford connection with the Wabash Railroad at that place.

Steubenville, Ohio.—Plans for a loop system for all traction lines in Steubenville have been mapped out by the city board of control and safety and street committees of Council. The idea is to route all city lines on a loop embracing Sixth, Adams, Third and Market Streets.

Inter-City Terminal Railway Company, North Little Rock, Ark., will formulate plans for laying tracks on the new Main Street bridge, which is being constructed to facilitate traffic between Little Rock and North Little Rock. The proposed improvements will cost about $150,000.

New York, N. Y.—The Transit Commission is planning to build a subway from Long Island City to Borough Hall and to extend the Fourth Avenue subway to Staten Island. George McAneny, chairman of the commission, recently made this announcement before the Brooklyn Chamber of Commerce.

Shenango Valley Traction Company, Youngstown, Ohio, will begin work on the double tracking of its line on Broadway, Farrell and South Dock Streets, Sharon. Where necessary, the present double-track section will be rebuilt so that there will be a continous double-track system. The rail used will be grooved girder. It will be laid on International twin steel ties.

Public Service Railway, Newark, N. J., is preparing plans for extending its lines to the proposed bridge plaza at Camden, where a structure will be erected across the Delaware River. The railway is waiting to hear from the bridge engineers before deciding on a loop or otherwise at the bridge approach.

Little Rock Railway & Electric Company, Little Rock, Ark., may be required to place its wires underground at the foot of Broadway Street, so that the work of constructing the new bridge across the river at this point may not be interfered with, according to a recent City Council resolution. The work will cost about $7,000.

Altoona & Logan Valley Electric Railway, Altoona, Pa., will soon start work on double-tracking the Eighteenth Street line between Eleventh Avenue and a point between the culvert and Nineteenth Street. The officials have under consideration the matter of extending the Fairview line beyond Fourth Street on Twenty-Second Avenue.

Savannah Electric & Power Company, Savannah, Ga., has started the work of repaving West Broad Street. The track improvements recently referred to in the ELECTRIC RAILWAY JOURNAL include heavier rail on the Thunderbolt line from Nelson's switch to the Casino, heavier rail on Forty-sixth Street and increased capacity of the Daffin Park line.

Interstate Public Service Company, Indianapolis, Ind., is working out plans for an extension of the electric transmission line from Salem to Campbellsburg, 12 miles west. A small plant is in operation in Campbellsburg at the present time, affording only fourteen-hour service, and business men are making every effort to obtain twenty-four hour service.

Marshall (Tex.) Traction Company may extend its line to serve a new industrial district established near that

Digitized by Google

city and schools. The city wants the line extended west to the Darco plant, then south around Wiley University, east to the Southside High School then north to join with the present terminus of the line on Fannin Street. The extension will make a belt around the city south of the Texas & Pacific Railway and will be more than a mile in length.

Portland Railway, Light & Power Company, Portland, Ore., will make extensive repairs to its tracks in various parts of the city during the coming summer. Definite plans have not been made but the tracks on Hawthorne Avenue will probably be reconstructed from East Water to East Twelfth Streets. In addition to its repair and reconstruction program, the railway company must participate in the costs of the improvement of Foster Road, East Twenty-eighth and Sixty-second Avenue Southeast.

Houston, Tex., John Henry Kirby of Houston, Tex., and other financiers are promoting a proposition to build an interurban line from Houston to Seabrook and other resort towns on the coast near Houston. The matter has been placed before Mayor Holcombe and the City Commissioners of Houston and application has been made for a franchise over the streets of the city of Houston. The proposed line will be about 25 miles in length and will reach all the resort places along the shores of Trinity Bay between Houston and the gulf.

Indiana Service Corporation, Fort Wayne, Ind., will co-operate with the Wabash, Ind., officials in repairing that portion of their car lines on the streets of Wabash. This includes the city car line and the interurban lines on West Market Street. General Manager Greenland was in Wabash recently to inspect with City Engineer Latchem the condition of the car lines. Mr. Greenland stated that the company would give its co-operation and send an engineer soon to make tentative plans for improvements needed.

Des Moines (Iowa) City Railway will make track extensions and improvements on two more lines this spring, according to F. C. Chambers, manager. On the Clark Street line a double track is to be put in from the point where the north line of Keosauqua Way intersects Twelfth Street, run north to School and west to Thirteenth Street. On the same line passing tracks are to be put in from Twenty-ninth Street to Thirty-second Street on Clark. This will make a total of six blocks of new track improvements on Clark. Passing tracks which now extend from Guthrie to Arthur Avenues on the East Sixth and Ninth line will be extended on two blocks further to Morton Avenue.

Springfield (Mass.) Street Railway through President Clark V. Wood reports an agreement with the Hampden County (Mass.) commissioners to pay an annual rental fee of $10,125 for the privilege of laying its tracks across the new Connecticut River bridge. A hearing has already been given by the City Council of Springfield on the company's petition for location of tracks approaching the new bridge. The company was very desirous of establishing a physical connection between its west and east side lines, so as to admit of running cars across the bridge and thence to principal urban and interurban routes, as deemed advisable, and it is said that this condition has been fulfilled. Cars, by this plan, would be looped around Court Square Extension by way of Water Street. The cost of building the approaches to the bridge is estimated by the company at $300,000.

Recent Incorporations

Lafayette (Ind.) Street Railway has filed articles of incorporation with Ed Jackson, Secretary of State for Indiana. The concern has taken over the local lines at Lafayette after sale under foreclosure.

South Florida Traction Company, Miami, Fla., has been incorporated. The officers are G. E. Merrick, president; F. King, vice-president, and I. M. Carr, secretary-treasurer. The line will operate south of Miami as far as Cocoanut Grove and will include Homestead and West Palm Beach.

Professional Notes

Edwin F. Wendt, consulting engineer is now established in the practice of engineering in connection with valuation, financing, consolidation, etc. His office is in the Union Trust Building, 740 Fifteenth Street, N. W., Washington, D. C.

Waddell & Son, Inc., New York City, consulting engineers for the Connecticut State Highway Commission on the Washington Bridge over the Housatonic River, designed the special track and overhead construction on the bascule span described in the issue of April 8. The article simply says "that the bridge was built under the direction of engineers of the State of Connecticut."

Trade Notes

The Economy Electric Devices Company, Chicago, has recently received orders from the Wheeling Traction Company for fifteen watt-hour meters; from the Poughkeepsie & Wappinger Falls Railway, for twenty-one meters; the Southern New York Power & Railway Corporation for eleven meters, and from the Haagsche Tramweg Maatschappy, Holland, for twenty 1,200-volt watt-hour meters.

The United Alloy Steel Corporation, Canton, Ohio, announces that John McConnell has again affiliated himself with the company in the capacity of vice-president, in charge of operation. Mr. McConnell gained a reputation in the early days with the United Steel Company in producing the first vanadium steel in commercial quantities made in America. His experience comprises ten years with the Carnegie Steel Company, three years with the Bethlehem Steel Company, eleven years with the United Steel Company (now the United Alloy Steel Corporation), one year with the Central Steel Company, as consulting metallurgist, and three years as vice-president, in charge of alloy steel production, with the Interstate Iron & Steel Company.

J. R. L. Glover, who has been connected with the Bridgeport Brass Company for the past six years, has been appointed sales engineer on brass and copper pipe and piping. He has first-hand knowledge of the processes involved in the making of sheet, tube, pipe and rod. He resigned his position with the Bridgeport Brass Company to enter the U. S. Air Service in France. After his return from the war he was given a position in the sales department of the company. He was soon given the title phono-electric engineer, a position which he created due to his effective promotion of the sale of phono-electric trolley wire, one of the best known products of the Bridgeport Brass Company, which is used extensively for trolley construction at points of dense traffic or severe wear. This position Mr. Glover held up to the time of his present advancement.

New Advertising Literature

The Federal Porcelain Company, Carey, Ohio, has recently issued its new Catalog No. 2, covering its line of standard electrical porcelains.

Dwight P. Robinson & Company, Inc., New York, N. Y., has begun the publication of a house organ entitled the *News*. Vol. 1, No. 1 is dated March, 1922, and gives several items relating to the work being done by this company in various parts of the world.

The Griscom-Russell Company, New York, N. Y., has just issued a new bulletin, No. 360, in reference to the application of evaporators for the purification of boiler feed water by distillation. The booklet describes the use of Reilly evaporators in the power plant for the elimination of scale, blow down, priming, etc.

The Galena Signal Oil Company, Franklin, Pa., has issued a booklet giving an alphabetical list of equipment parts for rolling stock, power plants, shops, etc., together with the particular lubricant recommended for each part. This gives in compact form the company's complete line of oils and greases for shop machinery and other railway equipment and will be of service as a convenient guide to the selection of the particular oil or grease that the experience of the company has proved the best and most economical for the purpose.

Supreme Court Decides Galveston Rate Case

THE decision of the United States Supreme Court in the Galveston case, rendered April 10, differs in a number of important respects from those in other rate cases. The city was willing to permit an 8 per cent return and the experts on both sides were agreed as to the cost of reproduction of the property on a historical basis and the amount of gross revenue and operating expenses. The main differences between the city and the company arose over various items in development cost, allowances for depreciation, maintenance and taxes, and the future trend of prices. The last-named question entered because the city maintained that prices were coming down and the company would soon be able to earn its 8 per cent, if it was not yet doing so, while the company wanted something more tangible than long-deferred hopes. In upholding the decision of the lower court, the Supreme Court declared it believed the city would probably "give full and fair consideration to a proposed change in rate if application were now made to it." If not, the court intimated that it was prepared to extend relief.

Some of the conclusions reached in its decision by the Supreme Court relating to going value are particularly interesting, especially those relating to the extent to which past losses and brokerage fees should be included in valuation. The consideration of the extent to which taxes may be deducted from income to determine what is a fair return will also attract attention.

Next Thursday Is Electric Railway Day

LAST year a number of electric railway companies celebrated May 4, the thirty-third anniversary of the completion in 1888 of the Richmond electric road, the first large electric railway in the world. At least five companies succeeded in resurrecting old horse cars, which were drawn about the streets of their respective cities to show what progress had been made in street railway transportation during the previous three decades. In three of these cases the car was driven by one of the horse-car drivers of the early days who was still connected with the company. The report of these celebrations in the issue of this paper for May 21, 1921, showed that they were witnessed by large crowds of interested people. Many of these had probably never seen a horse car before, and the comparison between this primitive conveyance and the comfortable and commodious electric car of modern type which accompanied it in several of the processions must have been impressive.

Certain other electric railway companies in the celebrations last year offered prizes for the best essays or historical reviews of the development of the local system. In one city the prize was limited to school children. Many electric railway companies referred to the anniversary in their advertisements in the daily papers. Most of the larger newspapers carried articles and editorials about the improvements in city transportation which had been effected during the past three decades.

Occasions and events of this kind are undoubtedly helpful to electric railway companies. Too many people take things for granted. They see electric cars running through the streets, but do not realize the long and expensive experiments which led up to the use of the present style of car. Still fewer probably understand that the cost of all of these expensive changes had to be defrayed by the electric railway companies.

For this reason an object lesson of the new and the old in transit is a good thing, and where the actual cars typical of the development are shown, it is more impressive than if the idea has to be conveyed by a printed statement. "Electric Railway Day" can well be celebrated each year, not necessarily in the same way, but in some way, for the benefit of the lesson that it carries.

Cross-Trench Nuisance Can Be Controlled

THE best possible foundation for a structure such as an electric railway track is solidly packed natural soil. Time is an important factor in the compacting process, and every disturbance interferes with the solidity of the soil. An electric railway which has a franchise for a track, even if it does not own the strip on which the track is built, should therefore have something to say regarding excavations through the franchise width of street area. Only thus can proper back-filling and pavement maintenance be assured.

Just how the electric railway's rights in this direction shall be safeguarded is a problem for local solution in each case. But the fundamental principle should be recognized that once the soil under a piece of track has been disturbed the track has a very uncertain support over the disturbed area until the soil is brought back to its original condition. Unless this is done the track must bridge the gap from solid soil to solid soil, with consequent effect on track and pavement. Photographs are reproduced elsewhere in this issue to illustrate the situation which actually develops, and an explanation is given of the way in which the results of these excavations are controlled in Montreal.

In the article referred to, the author outlines in humorous fashion the operations in an attack upon the integrity of a track foundation. The story which he tells will recall to the minds of the readers many experiences of the same nature if not of the same degree. The story enforces the logic of the whole matter, showing how ridiculous it is for a community to expect a railway to keep in condition its track, and oftentimes the inclosed and adjacent paving, and for the community at the same time not to furnish protection against damage to the track foundation. Followed as it is by an account of actual success in securing such protection, the story will do more than cause a smile.

Another Term Needed in Valuation Nomenclature

LAST week mention was made in these columns of an interesting byproduct of recent hearings before the New York Transit Commission, namely, the enrichment of the electric railway vocabulary by the term "rotating standee." The same series of hearings has also disclosed the need for a further addition to the terms used in railway valuation procedure, or at least this need has become apparent through conclusions which have been drawn in public print from some of the testimony presented to the commission by members of its own staff.

It will be remembered that in the act creating the present commission it was instructed to make a valuation of the property, other than franchise or going value, necessarily used in railway service in New York City. Wisely the commission concluded as a preliminary to make estimates on several bases, of which four have been concluded. These were reported in the issue of this paper of Feb. 25, page 333.

The Valuation Bureau of the commission recommended one of these as the correct measure of present fair value and termed this one the "actual or estimated original cost less an amount necessary to restore the property to first-class operating condition." We pointed out then, however, that as defined in the accompanying report this term was a misnomer and it would probably be misinterpreted by the public to mean legitimate investment rather than what the figures actually represent. That this is so is increasingly evident. In valuation nomenclature legitimate investment has supposedly been indicated by "historical cost," a term quite generally used. Briefly, the "historical cost" is the aggregate of the sums actually and legitimately expended in producing the property, and if applied to the physical property it includes the cost of all experimental work necessarily conducted to determine the system finally to be used, the reconstruction costs to produce more modern plant, etc.

The "original cost" valuation of the New York Transit Commission does not aim to give this figure, at least for the street surface lines and for the original elevated railway line. Instead, it represents the expenditure which would be required to reproduce the property in its physical condition as of the date of inventory, but with the cost for the several classes of work and material taken not at the prices of today but at those prevalent in the year corresponding to the construction, as nearly as may be estimated.

In the way in which these figures are used they form a perfectly legitimate basis to show what they intend to convey. But they are not and cannot be the same as "historical cost" or "legitimate investment," any more than the value of any of the great inventions when perfected is represented by the worth of the material used to construct the first successful models and valued at the time the material was bought. One might as well base the present value of the real estate on Manhattan Island at the twenty-four Dutch dollars paid for it by the early settlers to the guileless red men.

In the Galveston Electric Company case, reported this week, the Supreme Court speaks of the estimated cost of reproduction on the historical basis; that is, what the property ought to have cost on the basis of prices prevailing at the time the system and its various units were constructed." This is apparently similar to what the New York Valuation Bureau ascertained; except that we know that the New York figure does not include the development costs of changing from system to system as well as those caused by other obsolescence. The Galveston figure may; it is not clear.

Just how extensive the use of such a term would be is another question. It is not difficult to have a concept of the reproduction cost of a property at present prices, because that represents, at least theoretically, the expense of building a similar property at the present time. Nor is it hard to understand what is meant by reproduction cost at 1914 prices, because that would mean that the expense of reproduction is reduced to 1914 unit prices, which some people profess to consider "normal" at the present time. In the same way, the expression "historical cost" or "investment" conveys the definite meaning of the actual expenditure on the property.

But it is impossible to imagine either an electric railway property built today at prices of 1880 or 1890, or one built in 1880 or 1890, which would not have required some expenditures since that time for experimental development. In other words, there is no precedent, either in heaven above or in the earth beneath or in the waters under the earth, for such a manner of construction. It is neither like a property built today without experimental cost but at 1922 prices, nor is it like an old property built at the lower prices of two or three decades ago but with the burden in a new art of having been built at a time when the experience and knowledge of succeeding years were not available.

The facts here related make it clear how important it is that the nomenclature of the valuation business be cleared up—that there be a concise and descriptive expression for the basis of valuation used in New York, lest other mistakes be made in the future by contributors to journals of public opinion.

Maintenance Costs Should Be Kept on a Comparable Basis

ALL electric railway engineers are fond of making cost comparisons, and in fact they are quite necessary if the economies resulting from attention to detail in the various classes of work are to be evaluated. Compilation and comparison of costs furnish a powerful incentive toward increased efficiency, but in order for these to be of value they must include the same items. An example of a variation in practice occurs in the use of the item of carhouse maintenance. Some railways include this item in their rolling stock maintenance costs; others do not. Manifestly this leads to a variation that should be taken into consideration in making comparisons.

The problem of keeping a record of the cost and life of various wearing parts has received considerable attention from equipment engineers. A few roads have reported excellent results from the use of letters or symbols in the accountants' ledgers to designate the several parts of the equipment. The auditor is then in a position to draw off a statement of the quantity used and the cost of any particular part without great trouble. The men responsible for equipment maintenance require such records in order to conduct their work efficiently and the auditing departments are usually ready to co-operate as far as they can. By deciding on a few parts of which individual records are of advantage and then using a system so that these can be conveniently located, accurate cost records can be produced with considerably less work than by keeping individual car records in the maintenance department. If different roads follow the same practice in this particular, their cost figures can readily be compared.

Controlling Excavations Through Right-of-Way

Montreal (Quebec) Tramways Has Worked Successful Plan of Co-operation with City Under Which Railway Sanctions Digging Operations Affecting Its Track and Is Compensated for Expense Connected Therewith—Plan Has Been in Use for Nineteen Months

BY R. B. GENEST
Chief Clerk Engineering Department, Montreal Tramways

IN MANY cities and towns of the United States and Canada electric railways suffer from the actions of individuals who seem to delight in wrecking their roadbed by digging holes and excavations in the right-of-way, varying in depth from 1 ft. to 30 ft., of various widths, and of shapes geometrically indescribable.

For many years the Montreal Tramways had difficulty in collecting the cost of repairs made to tracks rendered necessary by openings and cuts of all kinds and dimensions made by the city of Montreal road, sewer and water works departments, by utility companies, by contractors and by private individuals. Many such openings were made within a few hours, and often late at night. While the company's inspectors were surveying lines in one part of the city, a contractor's forces would be penetrating the right-of-way in another part, and the opening would be refilled before the inspectors could reach the location and obtain the necessary information.

Liability for payment was denied in a large percentage of cases by the parties responsible for the excavations in the first instance, and prolonged controversies arose between the city departments and contractors as to the responsibility for the damage.

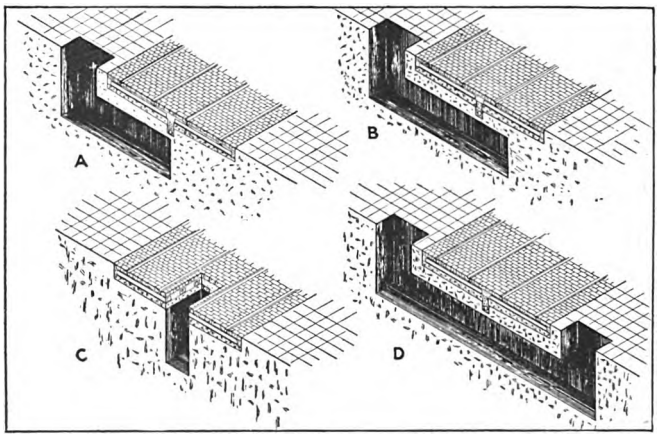
TRACK SUFFERS FROM E CAVATING BY IRRESPONSIBLE PERSONS

According to the city regulations, a contractor or individual, wishing to make a drain pipe connection to a sewer, applied to the city permit department for written authority to open up the pavement in the roadway. The procedure was somewhat as follows: John Doe & Company, house builders and apartment-house erectors, find that they must reach the city sewer in order properly to drain the building under construction. The sewer is located in the middle of the street, directly beneath the devil strip of the tramways' tracks. A call is sent out for expert representatives of the hole-digging fraternity, who have specialized for many years in the business of track wrecking. The services of Messrs. Hammeri & Bango are obtained. A form of contract is drawn up, in which it is stipulated that for the lump sum mentioned therein, Hammeri & Bango agree to deposit with the city of Montreal funds to cover the cost of disturbing the city paving in the vehicular roadway, and to accept all responsibility therefor. But in so far as the paving area within the boundaries of the tramways' tracks is concerned, no questions are asked.

THE JOB UNDER WAY

The excavation is started at the sidewalk curb. When the contractors reach the brow, or a point 18 in. from the outside rail, which is the boundary between the company's right-of-way and the vehicular roadway, the excavation is sloped at an angle of 45 deg. and a tunnel is commenced. A few cubic feet of concrete slab foundation is knocked off by way of testing its strength. An underground telephone line is encountered, and unfortunately a pick point penetrates a conduit. A few feet lower down a water main appears. There seems to be a leaky joint, as the substratum is quite heavy with moisture, and a small stream of water is running down the pipe. However, that is not the affair of Hammeri & Bango.

Excavation is now down 17 ft. The sewer (so the excavators were informed) is 20 ft. below the surface. Street cars roll by overhead; an occasional motor truck bumps across the rails. The sides of the excavation show signs of a cave-in. The diggers decide to go through the surface between the rails in one track and



THE FOUR TYPES OF EXCAVATION SPECIFIED IN THE MONTREAL AGREEMENT

in the devil strip. The paving block is pried up, the sand cushion is swept aside, and the concrete ballast is hammered loose with drills and sledges. A tie rod is in the way, but this can be easily bent to one side with a hammer blow and knocked back into position by the same method, damaged a little but still there.

The concrete slab is a little more difficult, but longer and sharper drills are used and the foundation is soon removed. A little more digging and pounding with bars, and the roof of the tunnel falls in; the worst is over. The roadbed is now well broken up, and 7 ft. or 8 ft. of skeleton track is exposed to view, the rails acting as steel stringers and the ties held to the rail by the spikes. A few lengths of 2-in. plank are inserted vertically against the sides of the excavation, blocked here and there with horizontal braces and forming a rough cofferdam. The danger of a cave-in is now eliminated, and the contractors descend into the hole and remove the balance of the loose material, reach the sewer, lay their pipe and make the connection. The excavated material is then loosely back-filled, and the broken-up paving block set on the surface. The job is completed according to tradition. Messrs. Hammeri & Bango hie themselves to the offices of John Doe & Company, collect their money and are ready to tackle the next wrecking job.

TYPICAL CLASS "A" OPENINGS THROUGH RIGHT-OF-WAY IN MONTREAL

No. 1—He left the paving base, anyway. No. 2—Rails suspended in midair. No. 3—Work of demolition begins.

Next morning the telephone company experiences line trouble in the immediate vicinity in which the wreckers were busy. Diagrams indicate the presence of a conduit in exactly the same location where the drain-connecting contractors were working. The loosely back-filled material is removed, the broken conduit is discovered and repaired and a bill is forwarded to the tramways company. A few days later a digging squad from the gas company appears, to lay a sewer service for the new building and make connections to the gas main, located across the street. The same hole is used, but it is necessary to undermine the remaining track by tunneling in order to reach the main. The now well-loosened excavated material is again thrown back into the hole and the surface is lightly tamped. Both tracks and the devil strip have been broken up and undermined.

About ten days later water begins to spout up through the surface here and there, and a small lake forms. A battalion from the city water works department arrives, accompanied by foreman and sub-foreman, and bringing pumps, jacks, block and tackle and truckloads of sundry material. A citizen who lives in the immediate vicinity regards the operations with disapproval, not knowing whether the workers are employed by the tramways company or the city. The workers seem to be making several holes right between the tracks, and they are also opening up where a hole has already been made. Why, in the name of common sense, the tramways company cannot leave well enough alone is beyond his understanding. It is not a month since the company disturbed the whole district putting down a brand new track and foundation. Inquiry discloses that the city is trying to locate a break in the water main. The break is finally located in the original excavation made by the drain-connecting experts. In the course of a week or so the pipe is made watertight, all holes are refilled and the track is left to settle and sink unmolested.

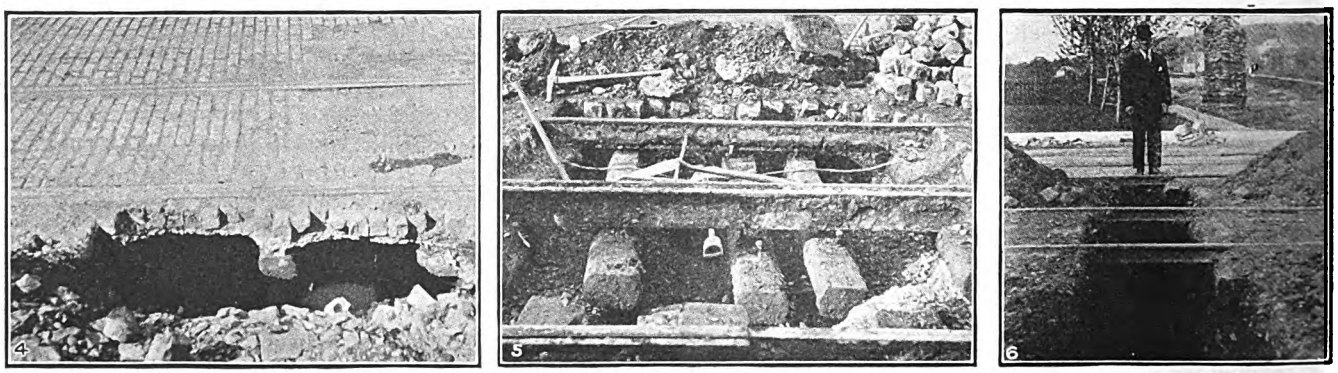
In the meantime the tramways' excavation inspector has been carefully viewing all operations, taking notes and measurements, and record of dates, names and addresses of all concerned, and further increasing the value of his information by several photographs.

MAKING GOOD THE DAMAGE

Finally the tramways' division roadmaster decides to repair the damage done to the track, as there appears to be no danger of further hole digging. A survey of the damaged roadway shows that six different excavations are located in a stretch of 60 ft. The conditions found are: Broken-up paving surface, broken and cupped joints, loose bolts and spikes, bent tie rods, sagged and twisted rail, shortened and cut-off ties, and ballast and foundations reduced to mud. A birdseye view of the track taken from the sidewalk shows a series of short vertical curves, resembling in appearance the general contour of a scenic railway.

The soggy mass now comprising the back-filled material is removed. The sides of the excavation are trimmed and the holes are filled with wet sand, packed and hard tamped. A new concrete slab is laid, joints are repaired, track is relined, concrete ballast is filled in, track is surfaced and new granite paving block is reset and grouted. The roadbed is again in operating condition.

A careful record of the cost of rehabilitating the track is made out by a construction timekeeper covering labor and material in detail. The question then arises as to whom the bills should be sent, and, if it is to be divided among the four parties concerned in the wrecking job, what proportion of the bill should



EXAMPLES OF CLASS "B" OPENINGS THROUGH RIGHT-OF-WAY

each party pay? Finally the account is forwarded to the tramways' accounting office for distribution and a tremendous amount of correspondence accumulates, involving the engineering, claims, accounting and legal departments, and also the utility companies, the contractors and the city departments.

In 1920 two Belgian roadbed wreckers undertook to dig a hole in a single track, which had to be repaired by the company immediately, as the track showed signs of depression shortly after the excavation was filled in. The cost of repairs in this instance amounted to $155. The Belgians, however, disappeared and the city authorities denied all responsibility for the bill.

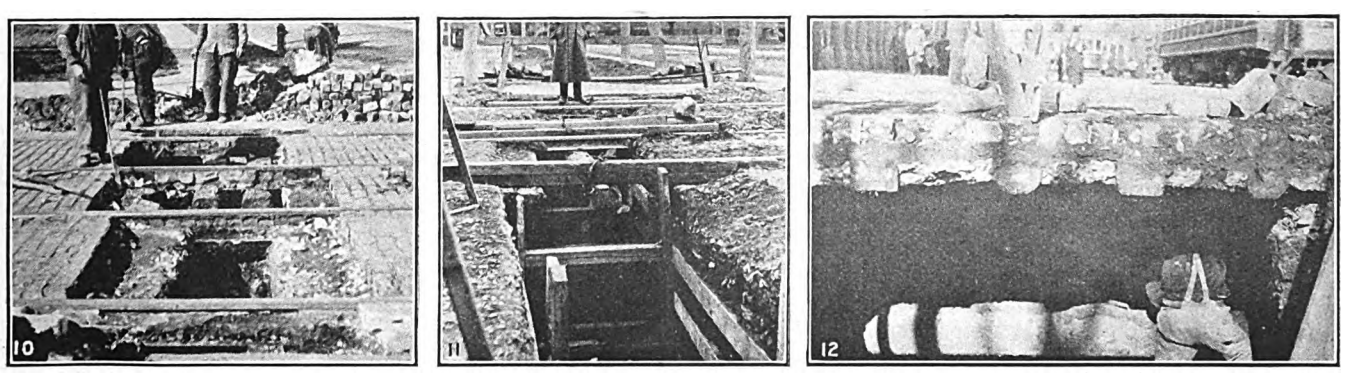
Co-operation Replaces Chaos

According to the operating contract between the city of Montreal and the Montreal Tramways, the company is responsible for the maintenance of the paving surface in the track area but, at the same time, the company has no right or authority to prevent any one from breaking up the paving area.

For many years the Montreal Tramways desired to bring about the institution of regulations to overcome these many difficulties. After several conferences with the city authorities and the Montreal Tramways Commission an agreement was finally drawn up. It was put into force on Sept. 13, 1920. Thus the company succeeded in obtaining some protection. The agreement is as follows:

. . . . Before the city of Montreal will issue a permit to a corporation or contractor to make openings for the purposes of installing pipes or sewer connections, etc., in the streets on which there are car tracks, and where it is necessary to go under the car tracks to reach utilities, the city of Montreal will require the applicant to show receipt from the Montreal Tramways Company, indicating that such applicant has made a deposit to the company covering its expense to make any repairs to the track and roadbed, made necessary on account of the operations of the corporation or contractor. The schedule of prices for doing this work and for the various types of openings shown on blueprint of our drawing No. 586 J.B. will be as follows: Type "A," $60; Type "B," $100; Type "C," $100; Type "D," $155. It being understood that after such deposit is made the Montreal Tramways Company will assume all liability for damage to its property; the applicant, corporation or contractor will, however, temporarily back-fill the opening to make it safe for the passage of the vehicular and pedestrian traffic in the streets. It is further understood that no rebate will be given to the applicant, corporation or contractor, in the event that the cost is less for repairing the damage to such excavations than as stated above, as it is understood that the prices quoted will about even up at the end of the year. The standard form of receipt will be given applicants for permits, which can be exhibited to your permit clerk, at the time of issuing city permit. The company reserves the right to increase or decrease the figures given as conditions may warrant.

This agreement has now been in force approximately one year and seven months, and, outside of a certain amount of difficulty experienced during the first six weeks or two months of its enactment, has proved satisfactory. During the preliminary stages a certain amount of tact was required in dealing with applicants for permits because they were not inclined to look with favor upon such a revolutionary change in the routine. Sporadic attempts were made to evade the regulations but, by exercise of care to detect infringement of the ordinance, the company was able to reduce the number of deposit evaders to a minimum. Instructions were issued to roadmasters, section foremen, and construction timekeepers to notify the head office immediately on discovery that an opening is being made in the company's right-of-way. This information is given to the excavation inspectors, who, between their rounds, report at stated hours to the head office and are, therefore, in constant communication with the construction



MISCELLANEOUS EXCAVATIONS KNOWN AS CLASS "D"

forces. Also, the local police have instructions to prevent penetration of the track area by any one unable to show a company permit.

HERE IS HOW THE AGREEMENT WORKS

Now, if a corporation or individual desires to make an excavation or opening through the right-of-way of the Montreal Tramways he applies to the city of Montreal permit department for a written authorization to open the city streets. He must explain satisfactorily the purpose of the opening. The city request from the engineering department (Form E-54) which is made out in duplicate, a carbon copy retained in the engineering department. The applicant then proceeds to the accounting office, where a deposit is made according to the classification mentioned in Form E-54, and he is given two copies of Form A.1. He is then in possession of the necessary authority to obtain a permit from the city of Montreal. The comptroller immediately forwards two carbon copies of Form A.1. to the engineering department, one of which is retained and attached to the file. The other is forwarded to the

FORMS USED IN CONNECTION WITH EXCAVATION UNDER TRACK IN MONTREAL

At left—Form E-18, which tells the story of the job. Top, right—Form A-1, used in notifying city of pavement opening authorization. Bottom, right—The originating document, E-54.

departments have drawings showing all streets upon which the Montreal Tramways' lines are operated, and they also know the location of the sewers and water mains. If the applicant plans to penetrate the company's right-of-way, the city withholds the permit until the tramways, in writing, sanctions the application, which is done only when a deposit has been made under the classification indicated on a reduction of the drawing No. 586 J. B. reproduced on page 703, and according to the classification as shown in the agreement above mentioned. The applicant obtains the permit excavation inspector, who then knows that the parties or individuals opening up the street have deposited the necessary sum of money to cover the cost of the opening to be made.

Next, the excavation inspector, having in his possession a copy each of Forms E-54 and A.1., proceeds to the location mentioned as soon as convenient and fills in Form E-18, retaining a carbon copy and forwarding the original to the engineering department head office. Copies of all three forms are then clipped together and placed in an envelope or folder bearing the number

Digitized by Google

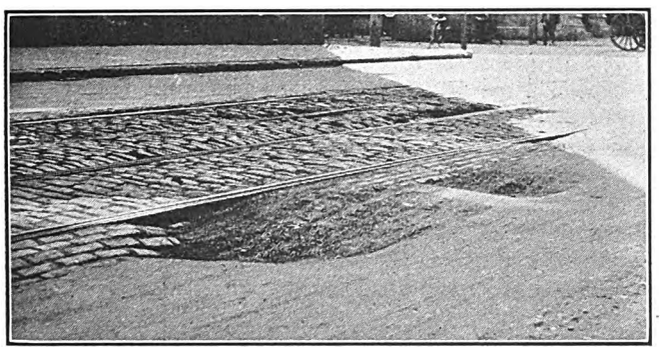
indicated on Form E-18 and filed in rotation of numbers. All excavations or street openings are referred to by the number indicated on the inspector's reports.

In addition to other records photographs furnish irrefutable evidence in litigation in connection with the payment of a repair bill for a street opening. On the Montreal Tramways photographs are made of all openings through the right-of-way, the photographer working in co-operation with the excavation inspector. On the back of each photographic print are noted the number of the excavation appearing on the inspector's report, the date, the location, and the inspector's and photographer's signatures. These men, if called into court to give evidence, are then in a position to supply information of value.

Typical photographs are reproduced to show the different types of opening, as indicated in the captions.

SCHEDULE OF CHARGES PROVES EQUITABLE

As a check on the fairness of the amounts stipulated in the agreement, forty-five different excavation records were picked at random from the file cases and compared.



DEPRESSION OCCURRING IN PAVING SURFACE AS A RESULT OF TUNNELING UNDER ROADBED

The difference between the actual cost of repair work and the sum of money deposited by applicants was found to amount to but $10 on the average.

In some instances it has been necessary to make exceptions from the schedule, for instance, in a case where the same opening might be used by two different city departments, or where a Class "A" opening has been extended to a Class "B" opening, or where the tramways was about to renew its track foundations. It would not then be reasonable to exact the full payment according to the agreement. The exceptions, however, have not caused any great difficulty, and, generally speaking, the operation of this agreement has been a success.

Technologic Papers of Bureau of Standards to Be Indexed

BEGINNING with No. 203, the pages of the Technologic Papers of the United States Bureau of Standards will be consecutively numbered to facilitate binding in volumes. Papers in the series will be paged consecutively until 750 pages are reached. The title page and index (issued separately) will be transmitted with the last technologic paper of each volume to subscribers who receive the complete series.

A descriptive list of all Bureau of Standards publications issued since the establishment of the bureau has been issued. This "Circular No. 24" may be had free on application to the Bureau of Standards, Department of Commerce, Washington, D. C.

New York State Railways Organized for Safety

Superimposed on a Continuous Accident-Reduction Campaign Covering Several Years, a Special Organization Made Effective This Year Is Already Producing Remarkable Results

BY A. W. KOEHLER
Director of Safety, New York State Railways, Rochester, N. Y.

BELIEVING that through organized accident prevention the burden imposed upon the company by needless accidents might be considerably lightened, the New York State Railways on Jan. 1, 1922, created an accident prevention department. The efforts of this department are being guided by a program which has been designed to embrace in its ramifications all of those features which have proved successful in the elimination of preventable accidents in industry.

The underlying conviction in this work has been that, to be successful, any movement which has for its purpose the reduction of accidents must be a co-operative one; motorist, pedestrian and trainmen must each subordinate his own immediate convenience and desire to the best interests and safety of the public. In addition to being co-operative, it must be continuous and follow some well-conceived plan as opposed to spasmodic or sporadic campaigns, characterized by hysterical display or propaganda of doubtful value.

Although in operation only a few months, the preventive measures employed by the State Railways already give promise of satisfactory results. Accidents from all recorded sources show a perceptible decrease. It may be fair to assume that this decrease is not due entirely to a favorable combination of events, but has resulted at least in a measure from methods adopted toward that end.

The creation of an accident prevention department by this company does not mark its entry into a new field. R. E. McDougall, formerly claim agent of the company and now general manager of the New York & Harlem Traction Lines, New York City, while in Rochester devoted a considerable portion of his time to safety. He stimulated an interest in accident prevention on the part of employees of the company through friendly competition. A silver loving cup offered to the station having fewest accidents during a given period was spiritedly contested for, and its possession was a matter of pride to the winner.

The results that attended these earlier efforts and the growing conviction on the part of officials of the company that accident prevention might further benefit the company and the community led to the formation of this new department which is devoting its entire energy to the work of safety.

FIGURES SHOWING REDUCTIONS IN ACCIDENTS OF VARIOUS KINDS

A comparison of accident records for the month of February with those of January of this year, as well as with February of last year, shows a reduction that is not confined to any one class of accidents but is evident in every recorded classification. The reduction over February, 1921, is 11.3 per cent, and over January of this year is 24 per cent. Comparing the records of January and February of this year, we have the following classifications and their corresponding reductions: Collisions with motor vehicles, 28 per cent; collisions

Digitized by Google

other than motor, 20 per cent; collisions with pedestrians, 62½ per cent; collisions with cars, 7.69 per cent; derailments, 35.48 per cent; employees injured, 57.14 per cent; alighting from cars, 7.14 per cent; boarding cars, 27.87 per cent; injured on cars, 8.51 per cent; damage to company's property, 22.76 per cent; miscellaneous, 13.33 per cent.

These results have been secured because eight to nine hundred men are alert and keenly observant of conditions or practices that make for accidents. Each day's reports bring to the accident prevention department a fund of information that makes it possible to deal intelligently with the accident situation.

THE TRAINMEN'S TRAFFIC REPORT

Records of violations of traffic ordinances on the part of motorists are most numerous. Of these the most frequent is the passing of a standing street car while the latter is taking on or discharging passengers. Since the advent of the "trainmen's traffic report," a sample of which is reproduced, violations of this sort have shown a marked decrease. "Stunts" by boys, such as stealing rides, hanging onto the sides of cars while riding bicycles, riding on the fender and similar dangerous practices, have also been reported and steps have been taken to discourage such acts of recklessness. In this work the schools are co-operating to a commendable degree. Motormen and conductors, inspectors, division superintendents and all of the various departments are co-operating to achieve the greatest possible reduction of accidents.

Car No. 457
Car Going Outbound.

Use Other Side for Additional Information

A SIMPLE FORM OF REPORT WHICH IS ACCOMPLISHING MUCH IN ROCHESTER

Safety committees have been appointed and are functioning in excellent fashion.

Points of contact are being established with all of the various agencies which might be instrumental in contributing to the success of the efforts as a whole. Of these, favorable mention is due the police department, whose active co-operation is a large factor in eliminating the hazard created by the reckless motorist, who passes at a greater speed than is compatible with safety a car which has stopped to discharge and take on passengers, or who otherwise endangers the lives of street car patrons.

The medium through which the information concerning the violation just mentioned is conveyed to the police is the trainmen's traffic report, already mentioned. Motormen and conductors are supplied with blank forms for these reports and on them notify the accident prevention department of any hazardous conditions or practices observed by them while operating cars over their different routes.

Another feature, the efficacy of which is making itself manifest, is that of writing a letter to some responsible person in a firm whose truck or wagon driver has violated a traffic ordinance. This letter advises the owner of the particular offense of which his driver has been guilty, the possible consequences are called to his mind and his co-operation to prevent a recurrence is sought. In every instance the reply to such a letter has brought assurance of the desire of the recipient to co-operate with us and his thanks for apprising him of dangerous practices indulged in by his drivers. Information regarding such practices is conveyed to the accident prevention department, also through the medium of the trainmen's traffic report.

Safety messages to the car riding public will be carried each week on cards in the car. These cards will bear the heading "Trolley Flashes" and will convey a different message each week. In addition, from thirty to forty thousand employees of industry will be reached through safety talks at their respective plants and articles published in the house organs of their employers.

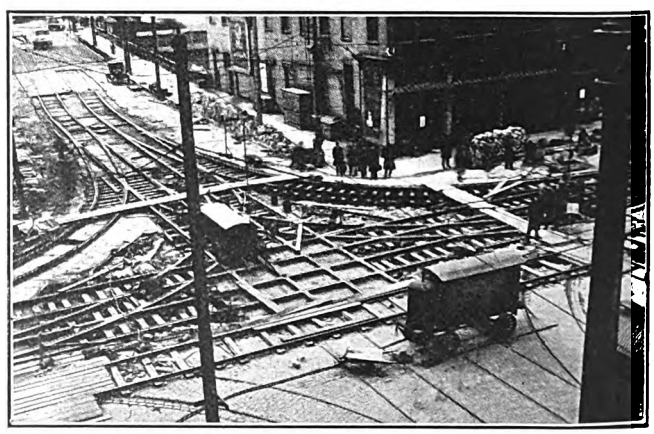
The schools too are co-operating actively by providing opportunity for safety talks to the pupils. These talks emphasize the ways in which school children can do their parts in assisting in our accident prevention measures.

From time to time the newspapers will be given articles dealing with the progress of our efforts, so that the subject will be kept constantly before the public.

Through these sources, and such other avenues of approach as may be opened to us, "Safety" will be brought to every man, woman and child in the community, and thus, in due time, marked reductions in accidents are inevitable.

Large Layout of Chrome Nickel Steel Special Trackwork

THE Milwaukee (Wis.) Electric Railway & Light Company is installing its first general layout of special trackwork made of chrome nickel steel, having originated the idea of the use of this metal in connection with steam road crossings in 1920. The full particulars about this type of special trackwork were published in ELECTRIC RAILWAY JOURNAL, Vol. 55, page 799.



NICKEL CHROME STEEL LAYOUT GOING IN AT EAST WATER AND MICHIGAN STREETS, MILWAUKEE

The Philadelphia Rapid Transit Company and one or two other street railway companies have since installed a number of chrome nickel steel layouts. Most of these and the one pictured herewith were manufactured by the Lorain Steel Company.

Notes from Southern Cities

Railways in South Active in Improving Properties Along Modern Lines—Chief Handicaps Are Jitney Competition and the Present Industrial Situation, Brought About Because of the Low Prices Being Obtained for the Principal Agricultural Products of the South

THE Birmingham Railway, Light & Power Company has been in the hands of a receiver since Jan. 23, 1919, but the property has been well maintained under the receiver and considerable reconstruction of cars and tracks has been done. With the revival of the steel industry, on which the city of Birmingham and neighboring communities largely depend for their prosperity, the benefits of this rehabilitation will become apparent. The Birmingham Railway, Light & Power Company is one of the group of American Cities Company properties now being reorganized. It has 154 miles of track and several long interurban extensions.

Birmingham is a city of recent growth, so that the main streets are wide and there is not the same street congestion as in many other cities in the South. From the railway point of view the wide streets have the disadvantage that they provide ample parking space for automobiles, and the competition from this source is considerable. Since 1915 there has also been some jitney competition, due largely, it is probable, to the unemployment situation in the steel industry. The jitneys number about fifty or sixty and charge various fares ranging from 10 cents to 7 cents, against 8 cents on the trolley, but they do some business, because of their higher speed.

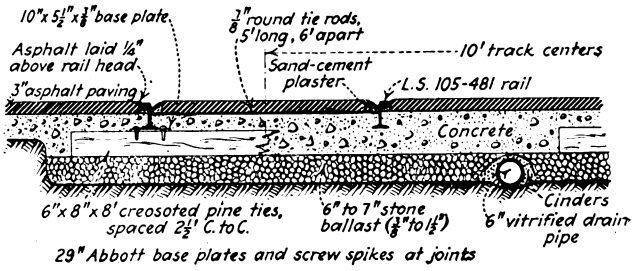
One step being taken by the company to meet this competition of jitney and private automobile is to provide more units by reducing the number of trailers and by operating more motor cars. By this means also the average speed is increased. A number of one-man cars have also been put in service. One hundred per cent one-man operation is not contemplated, but the company believes that it can use still more one-man cars to advantage.

Only one bus line has been started in Birmingham. This was promoted by the owners of a real estate development in the northern part of the city and was continued for about six years. It proved a losing venture, and an arrangement has been made within the last year between the land company and the trolley company by which the latter agreed to extend its tracks into the development and supply the necessary service. The buses were then withdrawn.

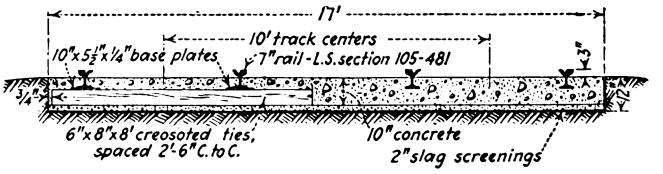
As with a few other companies, transfers are punched with the point of origin rather than the line to which the passenger wishes to transfer. The principal advantage claimed for this plan is that it saves the time of both conductor and passenger and avoids any dispute owing to misunderstanding between the two. The company is protected against looping by a provision printed on the back of the transfer that a passenger is not permitted to return on the transfer to a point near that from which he started.

A campaign directed against accident reduction was begun last year through an offer to the employees to divide among them 50 per cent of all the saving in the accident account over the average of the three previous years. Under this plan, during January, 1922, each man got $4.07. Shop men share in the division as well as trainmen, as they are held to have as much to do with the safety record as the trainmen. The latter are warned that the claim department requires complete reports of all accidents to assist in keeping down the cost of accidents. The result of this policy has been shown in the quality of the reports rendered of all accidents.

In new track and in track reconstruction in paved streets the company is using a 7-in. 105-lb. girder rail,



STANDARD GIRDER TRACK CONSTRUCTION ON PAVED STREET IN MEMPHIS



SPECIAL SHALLOW CONSTRUCTION IN MEMPHIS USED ON VIADUCT

or a 7-in. 101-lb. T-rail. Under special work the practice is to employ an 8-in. x 10-in. oak tie, but elsewhere to use creosoted pine ties. With a 7-in. T-rail a six-bolt 34-in. angle plate is used, welded top and bottom except at the extreme ends. Some work has been done during the past year in taking out left-handed turns in the downtown streets. Owing to the practice of the company to collect fares pay-enter inbound and pay-leave outbound loop operation in distinction from through operation is favored.

MEMPHIS

The Memphis Street Railway has constructed about 4.2 miles of track during the past year. Creosoted pine ties have been used in all new work. Although these cost $1.10 each at present as compared with 70 cents for untreated oak ties, the additional life of the creosoted ties is considered to warrant this additional expense. The Lowry process or creosoting is used. In some old track, which had been down thirty years and was recently taken up, certain of the creosoted ties were found in such good condition that they were used over again.

The standard track construction in Memphis in paved streets is shown in the accompanying section. The tie rests on 6 and 7 in. of stone ballast with concrete around the ties and under the rail. The joint is made with an eight-hole joint plate and an Abbott base plate. The former is electrically welded to the rail and the latter is screw-spiked to the tie and also electrically welded

Digitized by Google

to the base of the rail. No bonds are used except in special work. Screw spikes are used at joints and nail spikes elsewhere. The standard paving is asphalt with no headers or stretchers against the rail.

The principal matter of electric railway interest in Memphis is, of course, the operation of the property under the service-at-cost plan inaugurated in 1921, but this subject will be treated in a separate article.

Through co-operation with the city considerable reduction has been made in street congestion. Part of this was accomplished by rerouting and part by stricter enforcement of traffic ordinances. In consequence it has been possible to increase the scheduled speed of cars to 10.1 m.p.h., which is the basis on which all schedules are figured for the entire system. On Main Street, the principal business street, the scheduled speed has been increased from about 5 m.p.h. to more than 8 m.p.h. Under the new ordinance traffic checks are made frequently to determine the demand for transportation. Motormen and conductors are used for this purpose. Their figures are sent to the office and tabulated and charted.

AUGUSTA

Augusta has been undergoing a discontinuance of service, owing to jitney competition, which has been described in the news columns of this paper. For some time the Augusta railway, like some other railways in neighboring cities, has suffered from loss of traffic due to both private automobile and jitney. In the Southern States as a rule the country roads are poor, but for a short distance out from interurban centers they are generally in good condition and the absence of snow in winter encourages automobile driving for twelve months in the year. Residents in the Southern States are proverbially hospitable, and many a potential passenger on an electric railway is "given a lift" by a friend or even a stranger who is passing his way in a private automobile. On the other hand, the color line is drawn as strictly by jitneys as on the street cars or steam railroads. The result is that in most cities a jitney has to be either a "white" jitney or a "colored" jitney. This hampers their development to some extent.

The company has tried various methods of increasing traffic. One is to post at important boarding points time cards showing when cars pass that place. As a fifteen-minute service is run on many of the lines, this practice has been helpful. A force of four inspectors is employed, mostly in the center of the city, to check the passing time of the cars against the scheduled time, and the superintendent and assistant superintendent also do considerable checking.

The cash fare in Augusta is 10 cents, with tokens sold five for 40 cents. On the Augusta-Aiken division, 24 miles, there are eight 8-cent zones.

CHARLESTON

In Charleston there is a variety of fares. The cash fare is 7 cents, with a cash fare of 3 cents for children up to ten years of age. Tickets are sold four for 25 cents. There are two kinds of employees' tickets, one for people employed in the offices of the company, and these tickets are stamped with their names. There is also a form ticket for workmen used around the power plant and repair shop and on construction work. In addition, the company has a form ticket used on the through cars to North Charleston. This route has two zones, and besides the tickets already mentioned a special rate is available on this line of 20 cents for a round trip (instead of 28 cents) if the ticket is used between 5:40 and 8:30 a.m. and 4:20 and 6 p.m. This ticket is sold only in lots of six round-trip tickets for $1.20. Thirty per cent of the business of the company is done for cash and the rest in tickets. Two registers are employed, one for tickets and one for cash. The transfers for January, 1922, were 7.36 per cent of the revenue passengers. At present paper is being used for all of the tickets, and one of the problems before the company now is whether to substitute metal tokens for paper and how to collect both cash fare and tickets. Each plan is considered to possess certain advantages.

There is considerable jitney competition with the Charleston railway, but at present this comes entirely from individuals. Some time ago a regular bus company was organized to operate twenty cars, each seating ten persons, but this company has gone out of business. The railway company has about thirty-three one-man cars and is converting some others to one-man operation. Like other of the older cities, Charleston suffers because those who laid out its main streets did not realize the demands for street space which the twentieth century would bring. King Street, Charleston's prin-

"The Effect of Automobiles on Street Car Travel"

Has it ever occurred to you that automobiles have contributed largely to the position in which the street railway at present finds itself? Well, it is a fact that they have. Not only have we lost the fares formerly paid by the auto owners and members of their families, but thousands of fares are lost through auto owners "picking up" friends going to and from work in the mornings and afternoons.

How often have you stood on a street corner waiting for a street car, perhaps with several other folks, when just before the street car arrived an auto drove up and the would-be street car riders were invited to ride "as far as I go?" Each passenger thus lost reduces our revenue, and has a direct bearing upon the service we render.

We appeal to the auto owners to assist us in rendering a more satisfactory service to the people of Charleston by discontinuing this practice and thereby direct these fares into the proper channel. A prosperous street railway rendering an essential service is of greater value to the community than are the few cents to the individuals who are occasionally "picked up." Please allow those who would to patronize the street cars.

Your Co-operation Is Requested and Will Be Appreciated

CHARLESTON CONSOLIDATED RAILWAY & LIGHTING COMPANY

cipal business street, for example, is only about 35 ft. wide from curb to curb. The company is doing what it can to relieve this situation by speeding up cars, cutting out unnecessary stops and in other ways. The headway on most lines is ten minutes in winter and a shorter time in summer.

In Charleston the railway, electric lighting and gas services are all owned by the same company, and publicity is conducted through a regular department serving all three departments. Newspaper space and car folders are used.

A feature of the newspaper space is a series of friendly talks, called "Chats," carried in each of the three papers in Charleston on Tuesday, Thursday and Saturday. This series was begun July, 1921, and the space taken is usually one column wide and 8 in. deep, but this space is varied. Typical "Chats" on the railway system are reproduced on this page. Three prizes, all in car tickets, of $50, $30 and $20 were offered for the first, second and third prizes on May 4, 1921, "Electric Railway Day," for an essay on the advantages of electric railway cars as applied to Charleston. The paper which received first prize was a well prepared article which gives in detail the advantages to real estate owners, to school children, for social and recreational purposes, etc.

The car folder is entitled "Tri-Service," and the pages of a few recent issues are reproduced. Three departments are carried, named respectively "Smile-a-While," "Safety First" and "Happenings in Cardom."

"Chats with the Consolidated"

BACK TO NORMALCY—

Use Your Street Cars More

Saving is at the bottom of it. Our savings must repair the waste of war in addition to performing the usual job of developing our resources.

The man who rides the street car instead of using more expensive transportation is to be congratulated. He is helping the country by adding to the heaps and savings that will bring us back to normalcy.

He is helping himself by increasing his stake in the country through saving. He is helping the community to maintain a service that is vital to it.

The service he buys when he rides a street car is second to none in the country. The price he pays is reasonable. We repeat—he is to be congratulated.

"Patronize Your Street Cars"

CHARLESTON CONSOLIDATED RAILWAY & LIGHTING COMPANY

CHARLESTON-ISLE OF PALMS

The Charleston-Isle of Palms Traction Company's line is right across the bay from Charleston, with which it has connection by ferry owned by the company. The principal business is in summer, when all of the forty-two cars of the property are operated.

The usual method of operation is to send out a motor car with trailer followed by a motor car, as the line does not have loops at its terminals. On the arrival of the two-car train at the end of the line, the following motor car couples up to the trailer, which is uncoupled from the first motor car.

This line has the distinction of having raised fares during the last five years from 30 cents to $1.30 for the round trip.

Getting a British Franchise

THE procedure of getting authority to build a street railway of any kind in Great Britain is quite complicated. Many of the British tramway properties are municipal, but even a city cannot build a trolley line within its boundaries without getting a special bill through Parliament authorizing it to do so. If the undertaking is a private one, Parliament will not even consider the application unless the local authority, town or county council, approves. In London a somewhat different condition prevails. There the County Council is the tramway authority, but the local borough councils in London are the road authorities, and in most cases they possess power of veto and often exercise it.

Buses are on a different basis. If the local authorities wish to go into the bus business, they must get Parliamentary powers in which the routes are specified. If a private company wants to start a service, all it needs is to get the consent of the local authorities and licenses for the buses. If the proposed bus routes are likely to compete with the municipal tramway routes, the licenses probably will be refused. For interurban service where no such competition question arises, licenses apparently are secured for the asking. In London here also the condition is different. Neither the London County Council nor the metropolitan borough councils seem to have any say about buses. They are licensed by the Metropolitan police authorities, and their routes are regulated by them and by the Ministry of Transport.

One great reason for the great development of buses in London is that tramways are excluded from a considerable part of its area, including the downtown business and financial section known as "The City," and also from the fashionable West End.

After experimenting with double helical gears for the 2,500-hp. electric locomotives for the Gothard section, the Swiss Federal Railways has adopted the Maag spur gearing with case-hardened and ground pinion teeth. The wheel teeth are of unhardened steel. For the State Railways the pinion will be made of case-hardened chrome-steel and the wheel rim of forged steel.

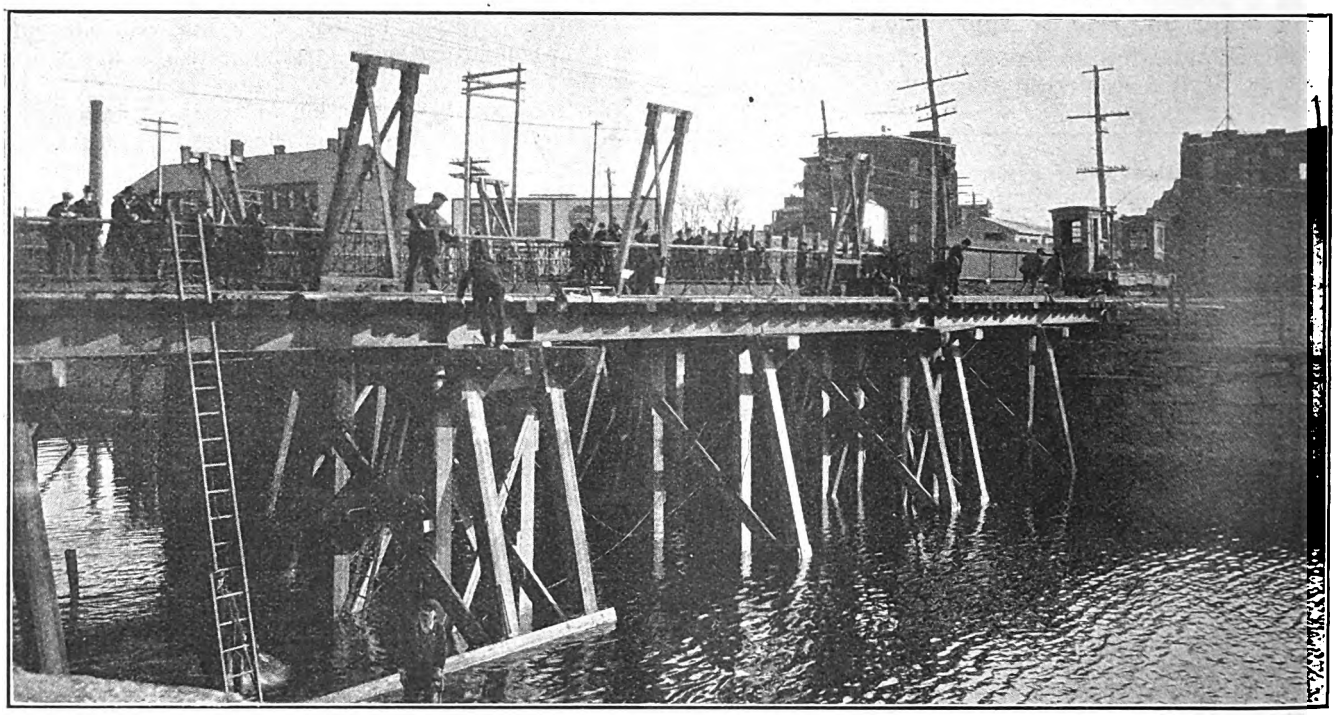
Electric Railway Bridge Built in Eleven Hours

Holyoke Street Railway Faced the Problem of Providing a Temporary Canal Crossing Instanter or Discontinuing Important Service for an Indefinite Period

EARLY in December, 1921, the engineering department of the Holyoke (Mass.) Street Railway, under the direction of George E. Pellissier, assistant general manager, did a remarkably quick piece of temporary bridge construction under circumstances which made this work espcially difficult.

This emergency job was necessary on account of a misunderstanding as to temporary diversion of electric railway traffic during the construction of the new "Valley Bridge" over the second level canal in Holyoke. The railway company was not informed that no provision for this had been made until it was almost too late to draw down the water in the canal to permit the erection of cribwork in its muddy bottom to support horses or bents for a trestle. However, with only five days available to secure the material necessary for the trestle, to fabricate it and to deliver it at the bridge site, and only one day available to erect the structure, the railway undertook the work. In explanation of the shortness of these periods, it should be said that on account of the ice it is impossible to draw the water out of the canals during the winter, and in the present case the water had been drawn out of this canal, presumably for the last time, two weeks prior to the day when the bridge was scheduled to be put in, namely, Sunday, Dec. 11. Fortunately weather conditions early in December were favorable, and it was possible, through the courtesy of the Holyoke Water Power Company, to draw the water out of the canal once more. It required until 11 a.m. Sunday to do this, however, and as the paper mills which draw water from this canal all had to resume operations early Monday morning, it was necessary to let the water back into the canal beginning soon after midnight. A total of but fifteen hours was available from the time the first work could be done until the job was completed and all materials, tools, etc., had been removed by the company from the canal bed.

The importance of this railway connection can be appreciated from the fact that about 300 cars cross the trestle each day and the entire community of South Hadley and Amherst would have been cut off from trolley connection with Holyoke unless the temporary bridge had been built.

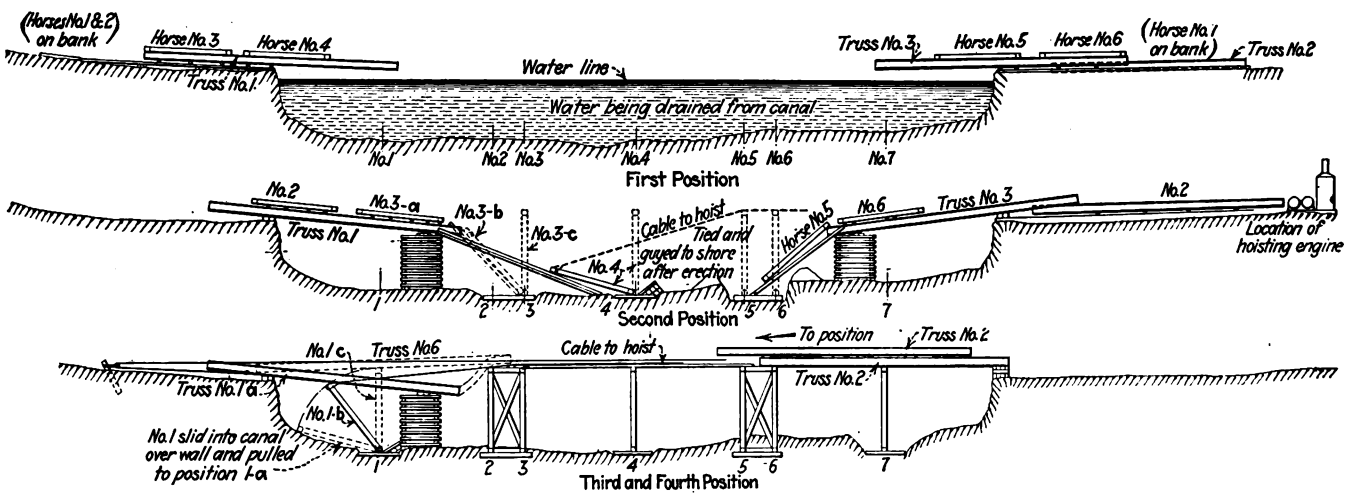


BUILDING A BRIDGE IN ELEVEN HOURS AT HOLYOKE, MASS.

The technical details of the construction are more or less standard and can be comprehended from the drawing reproduced. Soundings made before the water was drawn out showed that the canal bottom was soft ooze. Provision was made, therefore, for building cribwork on the bottom and timbers were framed to make up seven supporting horses. The horses were framed near by and slid into place by means of rollers and a donkey engine. The steel I-beams were lifted into place by means of the rigging shown in the accompanying drawing, in the following manner:

These horses were framed on the banks of the canal while the steel beams were being assembled and bolted together in three sections, each 50 ft. long. On two sections of steel work, one on either side of the canal, two complete horses were placed and the steel sections with their horses were mounted on rollers on the banks of the canal. While the water was being drawn out of the canal these steel sections were hauled out over the canal by means of a donkey engine (the only power

Digitized by Google



STEPS IN PROGRESS OF ERECTING BRIDGE WITH LITTLE MACHINERY AT HOLYOKE

equipment available for the job) until the sections were practically balanced on the edge of the wall.

As soon as the water was out of the canal a crib was made of ties on the bed of the canal under the ends of the projecting steel beams just high enough so that when the steel beams were tipped down they would strike a roll on top of the crib and slide right into place with one end of the beam resting on the bed of the canal. The two horses on these beams were thus deposited practically in their proper position and, being on an incline, very little effort was necessary to pull them into upright position and bolt them together to form the double horses or piers which are shown in the accompanying elevations.

The intermediate horses were then dropped over the wall of the canal and placed under the steel beams resting flat on the bottom but with their bases in their final position. A couple of stakes were driven to keep these bents from sliding and a line from the donkey engine to the top of the bents pulled them into an upright position. As they came up they lifted with them the two steel beams, which of course would then be in their final resting place. One of the sections was then used for a run to roll out the middle section end of the trestle, using the donkey engine for motive power.

Thermal Relay for Apparatus Protection

A LINE of thermal relays has been developed by the Westinghouse Electric & Manufacturing Company, which permits control of the circuit in such a way as to open it approximately when a piece of apparatus to be protected has reached a predetermined temperature. This is accomplished by providing in the relay a certain amount of resistance and of thermal capacity so that its temperature rises substantially with that of the apparatus to be protected. By adjustment of the relay the temperature at which it will open the circuit can be predetermined.

The operating mechanism of the relay consists of a number of sheets of thermostatic metal arranged in series or in parallel and with varying resistance, according to the desired current-carrying capacity. A contact is attached to one of the elements and is normally held with an initial tension against a stationary contact. At the proper temperature the bending of the thermostatic metal takes up this initial tension and the contact opens, thus opening the holding coil of a small circuit breaker to open the main circuit.

The relay may be provided with a pointer to indicate its temperature and thus furnish a guide to the temperature of the machine which it protects.

When Preservative Treatment of Wood Is an Economy

ALTHOUGH any set of timbers may be made more resistant to decay by preservative treatment, such treatment may not always be economical, even though the timbers are to be exposed to the most severe fungus attack. If the timbers are to be in service for a short time only, durability is unimportant, and any kind of preservative treatment would obviously be a waste of money. If, on the other hand, the wood is naturally of low durability and is to be used in a permanent location, it is easy for preservative treatment to show great savings. Between these two extremes there are any number of instances in which it is a more difficult problem to determine whether or not preservative treatment will pay. The United States Forest Products Laboratory has compiled some valuable information along this line, which is abstracted below.

If a timber user knows the average life that treated and untreated timbers are giving and the cost of each in place, he can easily compute, with the use of the accompanying table, the relative annual costs of maintaining the two. Assume as an extreme case, for example, that untreated timbers are giving an average life of two years and that their cost in place is $6 per set. Assuming an interest rate of 7 per cent, the table shows that timbers which need replacement every two years cost annually $0.553 on every dollar of their cost in place. For the $6 set, then, the annual maintenance cost would be 6 times $0.553, or $3.32. Treated timbers, the user may find, give an average life of fourteen years and cost $7.50 per set in place. The annual charge on timbers with a fourteen-year life is found in the table to be $0.116 on each dollar of their cost in place. The annual cost of maintaining the $7.50 treated set, therefore, would be 7.5 times $0.116 or $0.87. Preservative treatment, then, would save this user annually $2.45 per set.

If a timber user knows the cost of treated and untreated timber and the average life of the untreated timber only, he can estimate how long treated timber would have to last to be as cheap as untreated timber. In the case discussed above, the untreated timber cost $6 in place; the treated, $7.50; and the untreated timber was lasting two years. The annual charge on the untreated set was found to be $3.32, and since the annual charge on the $7.50 treated set is to equal this, we may set up the equation, $7.5 \times y = \$3.32$; then y (the annual charge on $1 expenditure) $= \$3.32 \div 7.5$, or $0.443. Referring again to the table and looking along the 7 per cent interest rate now, we find that an annual charge of $0.443 on the dollar falls between the two-year and three-year columns and evidently at a point equivalent to about a 2¾-year life. It can readily be seen from this that if treatment adds only three-quarters of a year to the life of the timbers, it would pay for itself, and the user could be sure from the experience of others that it would add much more than this and would therefore be profitable.

Advertising on Berlin Transfers

IN BERLIN, owing to the high cost of railway operation, advertising is being printed on both the front and back of transfer tickets and fare receipts. Some of this advertising is artistic, as shown by the advertise-

BERLIN TRAMWAY TICKETS CARRY ADVERTISING ON FRONT AND BACK

ment of the dealers in musical instruments on one of the tickets reproduced. In this case a verse of poetry is begun on the front of the ticket, and if the reader wishes to see the rest of it he has to turn to the back of the ticket, which carries the full advertisement of the dealers. The shoe dealer on the front of the transfer says simply that "the greatest bargain sale is at," creating curiosity on the part of the reader to see where the sale is taking place.

The charge for a single fare on the surface lines of Berlin is now 2 marks, and it is stated that the fare will probably be increased to 5 marks in the early future. Before the war a mark was worth 24 cents.

ANNUAL CHARGES ON EACH DOLLAR OF COST OF TIMBERS IN PLACE

Interest Rate Per cent	Life in years before replacement

Based on the formula, $A = \frac{P(1+r)^n r}{(1+r)^n - 1}$, in which A = annual charge.
P = amount of initial investment.
n = number of years in the recurring period (the average life of the timber).
r = the rate of interest expressed decimally.

Letters to the Editors

Arc Welding to Rail Webs

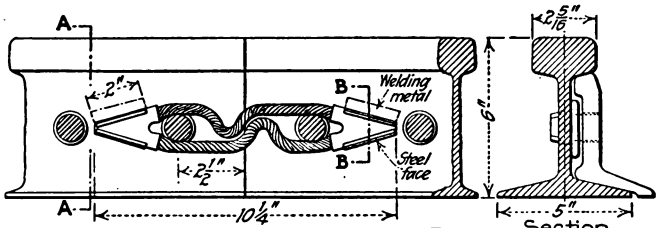
PUBLIC SERVICE RAILWAY

NEWARK, N. J., April 19, 1922.

To the Editors:

In the *Engineering News-Record* of March 30, page 524, appeared an article describing the effect on some 6-in. tee-rails of applying rail bonds to the rail web by means of the electric arc, as determined by a series of tests made by the Pittsburgh Testing Laboratory for the Canadian Engineering Agency, Inc., New York.

The tests were made under the standard drop-test machine specifications of the American Railway Engineering Association, 2,000-lb. weight with 15-ft. fall, some of the rails having bonds applied to their webs and others without the bonds. The bonded rails all



EXPERIMENTAL JOINT FOR USE IN TESTS TO DETERMINE EFFECT OF WELDING ON STRENGTH OF JOINT

broke on the first blow while the unbonded rails required from three to five blows before fracture occurred. In a second series of tests wherein the height of the drop was reduced to 10 ft., the bonded rails all broke on the first or second blow, whereas the unbonded rails required from four to five blows before failure occurred.

While the article did not state the type of electric arc used, whether carbon or metallic electrode was employed, the results obtained are nothing more than could reasonably have been expected. While no definite conclusions can be drawn as to the results which would have been obtained under actual service conditions, it is quite generally conceded that the web of a rail is not the best place in which to install a welded bond. The metal has quite a thin section at this portion of the rail and is that portion in which a considerable part of the internal stress due to unequal rate of cooling during rolling has developed. The intense heat of the electric arc, especially in the case of the carbon electrode or the resistance type of welders, would naturally affect the web more, because the heat is not conducted away from the weld and distributed through a large mass of metal as would be the case if the weld had been made on the head or base of the rail. Welding of plates to rail webs by such methods as that employed in making the Lorain bar weld has a materially different effect, because the temperature rise at the weld is accomplished much more gradually and the effect is not localized to the same extent as in the case of the arc weld, where the metal is suddenly changed from a solid to a molten state and suddenly solidified again. This sudden change would certainly increase brittleness of the steel at the point of weld and would cause the results the test produced.

HOWARD H. GEORGE,
Engineer of Maintenance of Way.

EDITORS' NOTE—The article in the *Engineering News-Record* to which Mr. George refers was entitled "Steel Rails Embrittled by Welding Bonds." It describes tests which were made in connection with the development of a theft-proof rail bond for the Mexico City street railway system. The bond was of the form shown in the accompanying illustration, comprising two strands of No. 0 copper cable connected at the end by spear-shaped cast-copper terminals faced along the outer edge with ⅛ in. of steel. The bond was designed to fit under the standard splice bar, passing around the bolt, and was to be attached to the rail web by means of electric arc welding of the steel facing to the rail metal.

Bonds were attached to about half the number of test pieces, in some cases with one of the terminals at mid-length of the specimen, in other cases with the two terminals symmetrically placed with respect to the mid-length of the rail. No more welding material was used than would be considered good practice, the test report states, and the welding process did not heat the rail to a noticeable degree.

In addition to the information which is quoted by Mr. George, the report states that quite abnormal shapes of fracture resulted in the case of the bonded specimens.

It was concluded from these tests that "serious injury is done to a rail by the welding process applied to its web," and the welded bonds therefore were not adopted for use. A form of bond passing under the splice and then attached to the head or base of the rail by welding may be adopted, however, as welding to the more massive parts of the section is not believed to injure the rail.

"The 'Ruthless' Trackless Trolley. It Is Destroying the Roads."

NEW YORK CITY, April 22, 1922.

To the Editors:

The above is a newspaper headline to an article on the effect of the trackless trolley on the cost of highway maintenance in the Borough of Richmond (Staten Island), where the city of New York is operating a trackless trolley system. This system was described in the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 15, 1921. It appears that the authorities in charge of the maintenance of the highways have petitioned the Board of Estimate for $281,600 for repaving two streets whose maintenance has become necessary because of the damage caused by the trackless trolley. The Borough President, in his request for funds for repairs, says: "As the present pavement is being destroyed by the trackless trolley operated by the city," etc. It further appears that 5,600,032 nickels will be needed to pay for the pavement.

The city is finding out that there is some virtue in trolley tracks with pavement maintained by the railways through the aid of the fare payers, thus again proving that the car rider is being taxed for pavement maintenance. Meanwhile, the Richmond authorities are attempting to have the pavement repaired at the expense of the Greater City at large in order to relieve the local taxpayers and property owners fronting on the streets to be repaved. Thus the entire city is asked to subsidize a supposedly cheap form of transportation which is not so cheap when road damage is considered, especially where the trackless trolley fare does not amortize maintenance costs.

This should serve as a warning to those railway companies which may be considering the trackless trolley

Digitized by Google

or even the motor bus to beware of any new entangling alliances with franchises which may require pavement maintenance. It also indicates the timeliness of the American Association's recently expressed desire for information on the cost of construction and maintenance of the public highways.

The writer considers that the situation found in Richmond Borough practically confirms some of the statements made in his letter to you dated Jan. 31, 1921, which appeared in the issue of the JOURNAL for Feb. 5, 1921. It was there noted that it will be necessary to build good roads for trackless trolleys, and that good roads cost about as much as good tracks. The experiment in Richmond Borough seems to prove also that it costs a lot of money to maintain roads for bus operation. What would happen to the streets in New York if their operation were to be multiplied many hundred-fold as desired by the Hylan bus or bus transit policy?

"ENGINEER."

*Psychological Tests Must Be Based on Facts**

NEW YORK, N. Y., April 20, 1922.

To the Editors:

The steps being taken by the American Electric Railway Transportation & Traffic Association, through its committee on personnel and training, to apply scientific methods in the selection and development of trainmen have been of great interest to me. It is especially gratifying to see the clear conception, on the part of the committee, of the value of utilizing in the solution of this important problem the accumulated scientific knowledge in the field of selection. The benefits to be derived from improving the personnel of platform men have been set forth in the reports of the committee and in the article by Dr. John Leeming in the March 11 issue of the ELECTRIC RAILWAY JOURNAL. Certainly no one will fail to see the practical results and actual savings in dollars and cents to be obtained through increased good will, the cutting down of operating costs and the reduction of accident claims, made possible by the adoption of sound principles of dealing with human relations. On the one item of the reduction of accident claims alone a large annual saving can be made.

The committee has made definite recommendations that psychological tests be used in the employment procedure and expects, I understand, to suggest concrete tests for use of the membership. It seems especially fitting at this juncture in the program, before definite tests or methods are tried out or adopted, for the JOURNAL through its columns to discuss the procedure which should be followed in order to avoid unnecessary pitfalls and obtain sound and permanent results.

While the use of tests is closely interwoven with the employment procedure and cannot be separated from it, my remarks will largely be confined to the requirements in the preparation and adoption of a testing program. To those who have been directly interested in the development and application of psychological tests to industry, it has been proved over and over again that getting the right start and adhering to a definite technique is of paramount importance. Probably the best thing I can do at this time is to point out just what a psychological test is, and second, to indicate the steps necessary in their preparation and application.

*The author of this letter has been engaged for years in the subject of practical psychology as applied to the personnel in different branches of industry.

What is a psychological test? To one it means a so-called character analysis; to another it means a series of information questions, similar to the "famous" Edison questionnaire; and to yet another it is simply a sort of examination or interview. This general misconception, coupled with the widespread exploitation on the part of the charlatan, is a matter of deep concern to the true psychologist. The long-headed business man, who would not think of turning over a technical piece of engineering to any but a trained engineer, or of turning over his books for an audit by any but a trained accountant, will in many cases, when it comes to applying tests, listen to almost any scheme put up to him. There seem to be two reasons for this attitude: First, each one of us is vitally interested in the human problem involved; second, the tests themselves seem to be quite simple, which causes a tendency to feel that they are easily prepared.

Just what a test is must be clearly understood. A psychological test is not an exercise, nor a problem *per se*, but a standardized task or series of tasks used as an instrument or tool to measure a particular trait or ability. The performance of the task is simply a means of taking a "sampling" of the ability, and is not a complete measure of it. In this manner, an opportunity for expression of the trait is given, and on the basis of this "sampling" it is possible to predict or estimate the total ability. The reliability of the test depends largely upon the task selected making a fair sampling. The principle is the same as that involved in testing steel, in testing chemicals, or in any kind of scientific test. In each case an analysis is made and what is to be tested for determined. Then standards are set up and samplings taken, and on the basis of what the samplings show an estimate of the whole is made.

Obviously, then, psychological tests for use in selecting men for definite types of work cannot be prepared by simply taking tests which have been used for an entirely different purpose or a different type of job. This error is probably the most common one made by the uninitiated. It is possible to get together a good collection of tests; but a test in itself means nothing. It is the interpretation which gives results, and in order to get the proper interpretation a definite procedure and technique must be followed in the preparation. The results of a good test may be entirely vitiated by preconceived ideas which lead to erroneous conclusions. One of the most common mistakes made is the assumption that the most intelligent man will be the best for a particular type of work. It has been conclusively proved that there is a range of intelligence which is best for each type of work; that there is an upper limit as well as a lower limit which should be adhered to if all the factors entering into efficiency and contentment are to be recognized. This principle is closely related to the problem of training and promotion, and in practice affects the policies and organization of each company. If opportunities for promotion are present, a higher type of ability may be secured and the range made wider than if the selection is made with the intention of keeping the man on the one job.

Experience has shown that the steps to be followed in preparing tests are: (1) A careful analysis of the job for which the tests are to be used, to determine the essential human qualities involved in efficient performance. (2) The preparation of tests for these qualities, tests which are simple and easily administered. (3) The standardization of the tests through tryout on men of

Digitized by Google

known ability. (4) Revision of the tests in light of the findings, and setting up of standards for use in the selection of new men.

Applying this procedure to the problem before the association, what does it mean? In the first place, there are no tests in existence, other than some mechanical devices such as are described in Dr. Gradenwitz's article in the JOURNAL of Jan. 28, which are directly applicable in the selection of motormen and conductors. It will be necessary, therefore, that a series of tests for this purpose be prepared. The first thing to do will be to make a careful and complete job analysis. Sitting in an armchair and guessing at the qualities involved will not be sufficient, even though one feels that he is familiar with the job. Until a systematic study is made of the duties of trainmen, there is very little basis upon which to proceed. At best, there will of necessity be a great many changes before the exact qualities will be found. When the qualities have been determined, practical tests may be devised. As a result of experience in the army and in industry during the last few years, great progress has been made in simplifying tests and methods of giving them. This experience should be drawn on by the association, for success largely depends upon the practicability of the tests themselves. In carrying out the third step, that of standardization of the tests, a representative group of at least five hundred men of known ability should be selected, preferably from a number of different companies, and the tests given to them, the results being checked against their efficiency on the job. A test is not ready for use until it has undergone such a tryout. Even then, only tentative standards will have been set. Before adequate standards can be determined, a great many revisions of the tests will in all probability have to be made, based on experiences in different companies as indicated by careful records. Standardization will be greatly facilitated in the program of the association by the comparisons which can readily be made, because the almost identical nature of the work in the different companies will permit the same tests to be used and standard procedure to be followed. Unless provision is made in the program of the association for keeping records of the results obtained in the various companies, adequate standardization will never be possible.

In my estimation, and I want to emphasize this in conclusion, it is better not to start the use of tests at all than to "get off on the wrong foot" by attempting to do in a hurry what requires time and patience as well as expert counsel to do. Testing is not something mysterious; but the utilization of the knowledge already obtained in the field is essential if results are to be permanent and satisfactory. N. L. HOOPINGARNER.

Single and Double-Door Safety Cars

HYDRO-ELECTRIC POWER COMMISSION OF ONTARIO

TORONTO, ONT., March 15, 1922.

To the Editors:

We have followed the various communications that have appeared in your journal on the above subject with very great interest, and after careful study have reached the same conclusions as expressed by Mr. Flowers in his letter of March 6, appearing in your issue of March 11.

About three months ago we placed an order with a local car company for twenty-five cars of the safety type and specified our own design rather than the standard, as we are absolutely convinced that satisfactory service cannot be given with the narrow aisles and single doors provided on the so-called standard car. The double doors on our car will be separately operated, and we have also deviated from the old standard by increasing the motor capacity to two 40-hp. motors.

We are thoroughly convinced that the wide aisles and separate entrances must be provided before a satisfactory car of this type can be produced.

FREDERICK A. GABY,
Chief Engineer.

One of the Busiest Traffic Streets in the World

Lower Court Is Upheld in Galveston Fare Case

United States Supreme Court Indicates Galveston Company May Reappeal to City for Relief from Five-Cent Fare Order Under Changed Economic Status if Court's Prophecy Has Proved Wrong

Action of the City Commission of Galveston, Tex., in fixing 5 cents as the fare to be charged there has been upheld by the United States Supreme Court. This marks an end to fare litigation that has been waged for several years. The opinion, delivered by Justice Brandeis, sustained the action of the United States District Court at Houston in dismissing without prejudice the application for an injunction on the part of the Galveston Electric Company.

The Opinion of the Court

THE street railway system of Galveston was started as a horse-car line in 1881. It was electrified about 1890 and after the hurricane of 1900 was largely rebuilt. Upon sale on foreclosure the railway passed in 1901 to a new company, and in 1905 it was purchased by the Galveston Electric Company, which supplies to the inhabitants of that city also electric light and power. At no time has the full fare on the railway been more than 5 cents—except during the period of eight months, from Oct. 1, 1918, to June 5, 1919, when 6 cents was charged. This higher fare was authorized by ordinance of the municipal Board of Commissioners, which possesses regulatory powers, and on June 5, 1919, the same board reduced the maximum fare to 5 cents. The latter ordinance was passed after a hearing and a finding by the board that with the reduced rate the company would continue to earn a fair return. Under the 1919 ordinance the company operated for eleven months. Then it brought this suit, in the federal court for southern Texas, to enjoin its enforcement. The company contends that the fare prescribed is confiscatory in violation of the Fourteenth Amendment; the city that it is sufficient to yield a return of 8 per cent on the value of the property used in the public service.

A temporary injunction having been denied, the court appointed a master to take the evidence and make advisory findings. There was substantially no dispute concerning the facts past or present. It was assumed, in view of then prevailing money rates, that 8 per cent was a fair return upon money invested in the business. The experts agreed on what they called the estimated undepreciated cost of production on the historical basis; that is, what the property ought to have cost on the basis of prices prevailing at the time the system and its various units were constructed. They agreed also on the amount of gross revenue, and on the expenditures made in operation and for taxes, except as hereinafter stated. The differences between the parties resulted, mainly, either from differences in prophecy as to the future trend of prices or from differences in legal opinion as to the elements to be considered in determining whether a fair return would be earned. These differences affected both the base value and the amount to be deemed net revenues. The master, who heard the case in October, 1920, and filed his report in November, made findings on which he advised that the fare was confiscatory. The District Judge, who heard the case in January, 1921, found a much smaller base value and much larger net revenues, stated that he did not deem it necessary to determine whether the ordinance "will produce exactly 8 per cent or a little more or a little short of it," declared that he was "not satisfied that the ordinance produces a return so plainly inadequate as to justify this court in interfering with the action of the municipality in the exercise of its rate-making function" and in March, 1921, entered a decree dismissing the bill without prejudice. In April he denied a petition for rehearing, 272 Fed. 147. The case comes here on appeal under Sec. 238 of the Judicial Code.

The undepreciated reproduction cost on the historical basis[1]—which seems to be substantially equivalent to what is often termed the prudent investment[2]—was agreed to be $1,715,825. The parties failed to agree in their estimates of the depreciation accrued up to 1921. The master estimated that, based on the 1913 price level, it was $390,000, and this estimate the court accepted. Thus measured, the value of the property, less depreciation, was $1,325,825. The court found that the net earnings under the 5-cent fare for the year ended June 30, 1920, had been $90,159 and for the year ended Dec. 31, 1920, $109,286, and estimated that for the year ended June 30, 1921, it would be at least $111,285. The return so found for the year ended June 30, 1920, is 6.8 per cent of $1,325,825; for the calendar year 1920, 8.2 per cent and for the year ended June 30, 1921, 8.4 per cent. The master made calculations only for the year ended June 30, 1920, and, mainly[3] because he allowed an amount for maintenance and depreciation equal to nearly 18 per cent of the prudent investment for the depreciable property (less accrued depreciation), found the net earnings to be only $50,249.60. This sum is 3.8 per cent on the prudent investment value, less depreciation. But neither the District Judge nor the master reached his conclusion as to net return by a calculation as simple as that indicated above.

Determination of Value

First—As the base value of the property, master and court took—instead of the prudent investment value—the estimated cost of reproduction at a later time, less depreciation; and in estimating reproduction cost both refused to use as a basis the prices actually prevailing at the time of the hearings. These had risen to 110 per cent above those of 1913. The basis for calculating reproduction cost adopted by all was prophecy as to the future general price level of commodities, labor and money. This predicted level, which they assumed would be stable for an indefinite period, they called the new plateau of prices. As to the height of this prophesied plateau there was naturally wide divergence of opinion. The company's expert prophesied that the level would be 60 to 70 per cent above 1913 prices; the master that an increase of 33⅓ per cent would prove fair, and the court accepted the master's prophecy of 33⅓ per cent.[4] Thus both master and court assumed a reproduction cost, after deducting accrued depreciation, of about $1,625,000. On this sum the net earnings found by the court yielded—after deducting a 4 per cent depreciation annuity on property subject to depreciation, a maintenance charge, and a charge for taxes, other than the federal income tax—a net return of 5½ per cent for the fiscal year ended June 30, 1920; of 6.7 per cent for the calendar year 1920, and the promise of more for the fiscal year ended June

[1] That is "the estimated undepreciated cost of reproduction of railway property of the company on the historical basis, exclusive of franchise value, going concern value, bond discount and brokerage fee," but with land and right of way which cost about $15,000 estimated at their present value of $58,836. It was also agreed, for the purpose of dividing joint items, that one-fifth of the property of the company was devoted to its light and power business.

[2] See Richberg, 31 Yale Law Journal, 263, 266, 279; Hale, 30 Yale Law Journal, 710, 720; Henderson, 33 Harvard Law Review, 902 and 1031; Friday, 36 Quarterly Journal of Economics, 197, 211.

[3] He allowed also on account of federal income taxes a sum of $8,008, which the court disallowed.

[4] From the agreed valuation of $1,715,825, the court deducted $425,117 for property not subject to this appreciation—land, already given its market value, and capital acquired recently (all acquisitions before Jan. 1, 1915, being assumed to have been at the 1913 price level, all since that date at the new level). The balance was appreciated ⅓; the $425,117 was added again; and accrued depreciation, likewise appreciated ⅓, was subtracted. The court thus obtained a base value of $1,626,061. The master's figure was slightly smaller (but for his inclusion of development cost and brokerage) for he excepted more property from this 33⅓ per cent appreciation.

30, 1921. But to fix base value the master added, and the court disallowed, items aggregating nearly $600,000, which must now be considered.

The most important of these items is $520,000 for "development cost." The item is called by the master also "going concern value or value of plant in successful operation." He could not have meant by this to cover the cost of establishing the system as a physically going concern, for the cost of converting the inert railway plant into an operating system is covered in the agreed historical value by items aggregating $202,000. These included, besides engineering, supervision, interest, taxes, law expenses, injuries and damages during construction, the sum of $73,281 for the expenses of organization and business management. The going concern value for which the master makes allowance is the cost of developing the operating railway system into a financially successful concern. The only evidence offered, or relied upon, to support his finding is a capitalization of the net balance of alleged past deficits in accordance with what was said to be the Wisconsin Rule.[5] The experts calculated this sum in various ways. One estimate placed the development cost at $2,000,000; a more moderate estimate by the company's expert was $575,300, and the city's expert made a calculation by which he estimated this so-called cost at $212,452.

Interpretation of "Development Cost"

If the rule were that a prescribed rate is to be held confiscatory in case net earnings are not sufficient to yield 8 per cent on the amount prudently invested in the business, there might be propriety in counting as part of the investment such amount, if any, as was necessarily expended at the start in overcoming initial difficulties incident to operation and in securing patronage. But no evidence of any such expenditure was introduced; and the claim of the company does not proceed upon that basis. What was presented by the witnesses are studies, on various theories, of what past deficiencies in net income would aggregate, if 4 per cent were allowed as a depreciation annually on the value of the property used. These calculations covered, on one basis, the period of thirty-nine years since the original horse-car line was built; on another, the period of fifteen years since the appellant purchased the property as a going concern. If net deficits so estimated were made a factor in the rate base, recognition of 8 per cent as a fair return on the continuing investment would imply substantially a guarantee by the community that the investor will net on his investment ultimately a return of 8 per cent yearly, with interest compounded on deferred payments; provided only that the traffic will in course of time bear a rate high enough to produce that amount.[6]

The fact that a utility may reach financial success only in time or not at all is a reason for allowing a liberal return on the money invested in the enterprise, but it does not make past losses an element to be considered in deciding what the base value is and whether the rate is confiscatory. A company which has failed to secure from year to year sufficient earnings to keep the investment unimpaired and to pay a fair return, whether its failure was the result of imprudence in engaging in the enterprise, or of errors in management, or of omission to exact proper prices for its output, cannot erect out of past deficits a legal basis for holding confiscatory for the future rates which would, on the basis of present reproduction value, otherwise be compensatory. Knoxville vs. Knoxville Water Company, 212 U. S. 1, 14.

Nor is there evidence in the record to justify the master's finding that a business brought to successful operation "should have a going concern value at least equal to one-third of its physical properties." Past losses obviously do not tend to prove present values. The fact that a sometime losing business becomes profitable eventually through growth of the community or more efficient management, tends to prove merely that the adventure was not wholly misconceived. It is doubtless true, as the master indicated, that a prospective purchaser of the Galveston system would be willing to pay more for it with a record of annual losses overcome than he would if the losses had continued. But would not the property be, at least, as valuable if the past had presented a record of continuous successes? And shall the base value be deemed less in law if there was no development cost, because success was instant and continuous? Or, if the success had been so great that, besides paying an annual return at the rate of 8 per cent, a large surplus had been accumulated, could the city insist that the base value be reduced by the amount of the surplus? Compare Newton vs. Consolidated Gas Company, decided March 6, 1922.

In determining the value of a business as between buyer and seller, the good will and earning power due to effective organization are often more important elements than tangible property. Where the public acquires the business, compensation must be made for these, at least under some circumstances. Omaha vs. Omaha Water Company, 218 U. S. 180, 202, 203; National Waterworks Company vs. Kansas City,, 62 Fed. 853, 865. And they, like past losses, should be considered in determining whether a rate charged by a public utility is reasonable. Compare Venner vs. Urbana Waterworks, 174 Fed. 348,352. But in determining whether a rate is confiscatory, good will and franchise value were excluded from the base value in Cedar Rapids Gas Company vs. Cedar Rapids, 223 U. S. 655, 669, and Des Moines Gas Company vs. Des Moines, 238 U. S. 153, 169; and the expressions in Denver vs. Denver Union Water Company, 246 U. S. 178, 184, 191, and in Lincoln Gas Company, vs. Lincoln, 250 U. S. 256, 267, are not to be taken as modifying in any respect the rule there declared. Going concern value and development cost, in the sense in which the master used these terms, are not to be included in the base value for the purpose of determining whether a rate is confiscatory.

Hypothetical Brokerage Fees Disallowed

The other item included by the master in determining base value, but disallowed by the court, is $67,078 for brokerage fees. There is no evidence that any sum was in fact paid as brokerage, and there was included, as above shown, the sum of $73,281 for organization and business management in calculating the historical reproduction cost. The finding of the master rests upon testimony that bankers customarily get, in some form, compensation equal to 4 per cent on the money procured by them for such enterprises.[7] But compensation for bankers' services is often paid in the lessened price at which they take the company's securities, and is thus represented in the higher rate of interest or dividend paid on the money actually received by the company as capital. The reason given by the master for including the allowance for an assumed brokerage fee is that a brokerage fee is "a normal incident of large industrial investments and has not been amortized," since "the record shows that the plant has been operated at a loss." If base value were to be fixed by the money expended, brokerage fees actually paid might with propriety be included, as are taxes paid pending construction. But as the base value considered is the present value, that value must be measured by money; and the customary cost of obtaining the money is immaterial. We cannot say that the court erred in refusing to include in base value an allowance for hypothetical broker's fees.

The appellants insisted also that the base value should be raised by assuming that the future plateau of prices would be 60 to 70 per cent above the historical reproduction value instead of 33⅓ per cent as the master and the court assumed. The appellees insisted, on the other hand, that an item of $142,281 for

[5] Hill vs. Antigo Water Company, 3 Wis. R. R. Com. Reports, 623, 705-723. But see Cunningham vs. Chippewa Falls Water Company, 5 Wis. R. R. Com. Reports, 302, 315; Appleton vs. Appleton Water Works Company, 5 Wis. R. R. Com. Reports, 215, 277; In re Purchase Racine Water Works Plant, 19 Wis. R. R. Com. Reports, 83. 140.

[6] On the other hand, if what is to be considered in determining the net deficit is not the result of operations from the beginning of the enterprise, but the result of operations since the present owner acquired it—in other words, the return on its investment—we are left without the data necessary to determine the fact. For the record does not disclose what the present company paid when it purchased the property in 1905 as a going concern. For aught that appears, appellant has received full 8 per cent annually on that amount and later additions to capital.

[7] The record cost of the property was originally used as the base for this calculation. But the figure $67,076 was tacitly agreed by both parties to be the amount, if any, that should be allowed for brokerage.

Digitized by Google

grade raising included by master and court in the historical cost should be eliminated. We cannot say there was error in over-ruling these contentions.

DEPRECIATION, MAINTENANCE, TAXES

Second—Concerning deductions to be made from gross revenue in order to determine net earnings, the court differed from the master in regard both to the yearly charge for maintenance and to the depreciation annuity. It appeared that in the fifteen years since appellant acquired the system in 1905, the average annual expenditure for maintenance had been $42,771; that during the war the property had been admittedly undermaintained; that the expenditure was $64,108 in the calendar year 1919; $80,322 in the fiscal year ended June 30, 1920, and $90,861.28 in the calendar year 1920. The court estimated the proper charge for current maintenance at $70,000, and allowed, in addition, a depreciation annuity of $45,245 (that is, 4 per cent on property subject to depreciation) to provide a fund out of which annual replacements and renewals could be made. Thus the court allowed for the year's depreciation and maintenance $115,245, which is nearly 14 per cent of the historical reproduction value, and about 10 per cent of the assumed reproduction cost, of the depreciable part of the system. The master allowed $147,146.40 for maintenance and depreciation during the year ended June 30, 1920. This larger figure was arrived at, partly by charging as cost of maintenance the full $80,322 expended during that year, and partly by including as depreciable property expenditures for overhead items which the court excluded. The proper annual charge for maintenance is the amount normally required for that purpose during the period; it is not necessarily the amount actually expended within the year. Many items included in the overhead cost of original construction may properly be excluded in calculating the amount of the depreciation annuity. We cannot say that the court erred in limiting the year's maintenance and depreciation allowances to $115,245.

The company asked to have allowed as a further charge $29,500 a year on account of what it called deferred maintenance. The contention is that during the war and two years following, the company had deferred maintenance, pursuant to a policy established at the express request of the Government to the end that material and labor might be released for war purposes; that to make good this deferred maintenance would cost $197,000, and that in order to amortize this amount an annual allowance from earnings of $29,500 should be made for five years. This is an attempt, in another form, to capitalize alleged past losses, and the request was properly refused.

Third—The remaining item as to which the master and the court differed relates to the income tax. The company assigns as error that the master allowed, but the court disallowed, as a part of the operating expenses for the year ended June 30, 1920, the sum of $16,254 paid by the company during that year for federal income taxes. The tax referred to is presumably that imposed by the act of Feb. 24, 1919, c. 18, Secs. 230-238, 40 Stat. 1057, 1075-1080, which for any year after 1918 is 10 per cent of the net income. In calculating whether the 5-cent fare will yield a proper return, it is necessary to deduct from gross revenue the expenses and charges, and all taxes which would be payable if a fair return were earned are appropriate deductions. There is no difference in this respect between state and federal taxes or between income taxes and others. But the fact that it is the federal corporate income tax for which deduction is made must be taken into consideration in determining what rate of return shall be deemed fair. For under Section 216 the stockholder does not include in the income on which the normal federal tax is payable dividends received from the corporation. This tax exemption is therefore, in effect, part of the return on the investment[8].

1922 EARNINGS MAY BE 8 PER CENT

It is thus clear that both in the year ended June 30, 1920, and in the calendar year 1920 the net earnings of the system were less than 8 per cent of its value, whether the value be estimated on the basis of prudent investment or on the basis of the reproduction cost actually adopted. When the court rendered its decision the ordinance had been tested for more than a year and a half—a period ample in ordinary times to test the current effect of the rate prescribed and to indicate its probable effect in the near future. The times here involved were, however, in a high degree abnormal. It did not follow that, because the system had earned less than 8 per cent in 1919 and in 1920, it would earn less than 8 per cent in 1921. A rate ordinance invalid when adopted may later become valid, just as an ordinance valid when made may become invalid by change in conditions. Municipal Gas Company vs. Commission, 225 N. Y. 89, 96. Compare Willcox vs. Consolidated Gas Company, 212 U. S. 19; Newton vs. Consolidated Gas Company, decided March 6, 1922.

The District Judge was obliged to form an opinion as to the probable net earnings in the future. All relevant facts, except as stated, and all applicable arguments were fully and clearly presented by the parties and were carefully considered by the court. Although the District Judge treated the master's report as advisory merely, he passed upon the numerous exceptions taken to the master's findings in order to indicate his view on the precise points raised. He allowed some exceptions and disallowed others. Upon petition for rehearing further careful consideration was given to the case. Views expressed in the first opinion on some matters were modified; but these changes did not call for any change in the decree. The District Judge had before him some evidence not before the master; for the company's expert was recalled and testified both to the result of operations of later months in which there was a large increase in travel and to the heavy decline in prices which occurred after October. Concerning actual facts there was substantially no controversy. On the elements to be considered in determining whether the rate would be confiscatory no error was made which could substantially affect the result. His determination whether the prescribed rate would be confiscatory was necessarily based largely on a prophecy, for normal conditions had not been restored. He found that gross revenues were steadily increasing; and that they were larger under the 5-cent fare than they had been during the preceding year when the 6-cent rate was in effect. He was convinced that operating costs would decrease largely during the year. His two opinions show that every element upon which his prophecy should be based received careful consideration. We cannot say that the evidence compelled a conviction that the rate would prove inadequate. Compare San Diego Land & Town Company vs. National City, 174 U. S. 739, 754. San Diego Land & Town Company vs. Jasper, 189 U. S. 439; Knoxville vs. Knoxville Water Company, 212 U. S. 1, 17.

The occasion for the suit was solely the extraordinary rise in prices incident to the war. There was no suggestion that action of the board evidenced hostility to the utility, or that the board was arbitrary or hasty. It had been theretofore considerate of the company's rights and needs. When prices rose rapidly in 1918, it raised the fare limit to 6 cents, although the franchise ordinance prescribed the 5-cent fare. And this was before our decision in San Antonio vs. San Antonio Public Service Company, 255 U. S. 547. Its reduction of the fare by ordinance of June 5, 1919, was made after hearing, and was doubtless due to the conviction, shared by many, that, with the cessation of hostilities and the negotiation of the peace treaty, prices and operating cost would fall abruptly. This prophecy, if such there was, proved false. But nearly three years have elapsed since the board adopted the ordinance; and more than a year since entry of the decree below. We know judicially that the period has, in general, been one of continuous price recession, and that the current rates of

[8] It is difficult to see how, on the facts presented, so large a sum as $16,254 could have been paid on account of the year's operation. Indeed the court, in disallowing the item of federal income tax, deducted not $16,254, but $8,008. Even this seems too large, for the net earnings, without deduction of the $16,254 attributed to income tax, for the year ended June 30, 1920, as found by the master, were $66,503.60. From this, interest paid or accrued on indebtedness is to be deducted before computing the net income on which the tax is payable. A large part of the capital of utility companies is ordinarily represented by interest-bearing bonds and notes, and there is evidence that such indebtedness of the appellant was "in the neighborhood of $1,400,000." The interest on this debt chargeable to the railway system would be at least $50,000. There is further an exemption from tax of $2,000 of the net income. So a 10 per cent tax on the balance would amount to less than $1,500.

In the record and briefs elsewhere the income tax is reckoned at between $8,000 and $10,000, which is a proper figure if there be an 8 per cent return on $1,626,061.

Digitized by Google

return on capital are much lower than they then were*. But we cannot know to what extent the important changes occurring have affected either gross revenues or the net return. There is no reason to believe that the board would not give full and fair consideration to a proposed change in rate if application were now made to it. And the District Judge stated in his opinion (272 Fed. 147) that the decree to be entered would be vacated or amended in case it should later appear that the regulating board declined such adjustment of rates as the actual experience of the utility might show it entitled to; and the decree was thereupon entered without prejudice.

The District Judge refused a temporary injunction and did not exact a bond. Hence the only relief we can grant is such as operates *in futuro*. Compare Duplex Printing Press Company vs. Deering, 254 U. S. 443, 464. An injunction should not issue now, unless conditions are such that the prescribed rate is confiscatory. As by the reservation in the decree appellant may secure protection against the ordinance if under existing conditions the 5-cent rate appears to be inadequate, the decree should be affirmed. Compare Lincoln Gas & Electric Company vs. Lincoln, 250 U. S. 256, 268; 257 U. S.

Action by Galveston Company

In anticipation of a decision that would not restore the 6-cent fare but would authorize the company to seek relief through application to the constituted authorities, the Galveston Electric Company has made application to the City Commission for authority to increase its fares to 6 cents. In this connection the company petitioned the City Commission to order an audit of its books to the end that the real conditions in regard to profits or losses of the company might be determined. The City Commission granted this petition and at a meeting just two days before the Supreme Court decided the fare case directed that the books of the Galveston Electric Company be audited.

In discussing the petition for an audit, City Attorney Frank S. Anderson told the commission that without an audit of the traction company's books which would show whether the figures presented by the company were correct, it would be impossible to determine if the profits under a 5-cent fare were inadequate.

On being advised of the decision by the Supreme Court, R. G. Carroll, general manager of the Galveston Electric Company, said:

> When the district federal court rendered its decision it found that the return, as reflected by the records, was undoubtedly less than the law regards as fair.
>
> The court, however, felt that the future earnings of the company would be sufficient to permit the company to earn a fair return, and issued its injunction as follows:
>
> "The injunction prayed for will be denied upon a decree so drawn as to permit the complainant to again apply as it may be advised, should the actual experience of the future prove the prophecy false."
>
> Unfortunately, the earnings of the company have declined, rather than increased, so that the present moment finds the company in a strained financial position and not earning a return that the law regards as fair.
>
> In view of the above conditions, the company has presented its condition to the city commission of Galveston for further consideration.

William E. Tucker, Boston, Mass., who represented Stone & Webster in the trial of the case just decided, expressed the opinion that the most significant thing about the court's decision is the "indirect reaffirmation by the Supreme Court of the United States of the now well-established principle that in Texas a 5-cent fare provision written into a franchise is not a contract between a city and a railway system, but is in fact no more than the exercise of the rate-making power of the city, and as such is subject to the provision against confiscation contained in the Fourteenth Amendment to the Constitution."

Mr. Tucker explains that the new appeal of the company for relief is based on the ground that under the present operative conditions a fair return on its property is not being earned. He says that while the Supreme Court held that the District Court did not err in its early conclusion, the prophecy of the court in that case with respect to the probable future earnings of the company was wrong, and that the right adheres to the company under the existing circumstances to seek relief either from the City Commission or the District Court.

*See Federal Reserve Bulletin, January, 1922, pages 5, 79, 113; February, 1922, pages, 156-157.

All-Electric Power Signaling on London Metropolitan Railway

Progressive British Road Has Adopted Signal Improvements as These Became Available, and Is Still Experimenting with a View to Utilizing Latest Inventions.

SOME interesting particulars of the all-electric automatic power signaling on the Metropolitan Railway (London) have just been given to the Institution of Civil Engineers by William Willcox, M. A. M. Inst. C. E. In 1905, when electric service was inaugurated on the Metropolitan Railway, the signaling was mechanically controlled by the Spagnoletti lock and block. The number of trains between Praed Street junction and Aldgate, a distance of about 5 miles, was then 621 per day on both roads, and the number of signal sections was forty-nine. As the number of trains was increased, it was found necessary to introduce automatic signaling controlled by track circuits. The system chosen was all-electric, the work was undertaken in 1908 and this section was completed in the following year. Two power frames were installed, one at Praed Street and one at Aldgate, to handle the traffic at these places; but the existing mechanical boxes were retained at the intervening stations for shunting purposes, with the addition of the safeguards provided by track control. The number of trains in 1913 at Praed Street was 863, and from Baker Street to Aldgate 983, with ninety-one signal sections.

There are about twenty hours daily of continuous passenger traffic, but from 7.30 to 10 a. m. and from 4.30 to 7.30 p. m., the traffic is so dense as to necessitate forty trains each to and from the city per hour. The automatic signaling dealt with these satisfactorily. Similar signaling was therefore installed between Baker Street and Neasden in 1911, the number of signaling sections being increased from twenty-four to fifty-one.

At this date there was only one through line at Baker Street handled by two signal boxes, one at the north end of the station and one at the Circle end. This through line was track-circuited, and full protection was afforded to train movements, allowing forty-eight through passenger trains to be run to and from the city. All the current used in these installations was continuous.

In 1913 the new Baker Street station was completed, and automatic signaling was installed between the Circle lines and the north end of the station. For this purpose a small signal box was constructed on a retaining wall so as to be out of the way, and in it a power frame of thirty-six levers (6 spare) was erected. This power frame handles more than 1,500 trains a day, and the signalman has no view of the trains except those within station limits immediately in front of his box. Through the station all signals and points are controlled by direct current, but the track circuits are alternating current.

In 1913, also, two new fast lines were constructed alongside the old or local lines from Finchley Road to Wembley Park, a distance of 5 miles. Through the junction at Finchley Road and on to Wembley Park alternating current track circuits were installed, but the signals are worked by direct current as far as Neasden power house. From this point to Harrow-on-the-Hill alternating current is used for the signals as well as for the tracks, and from the same point alternating current is used for both tracks and signals on the local lines to the junction north of Wembley Park station where the fast and local lines converge. From Baker Street to Harrow-on-the-Hill, before automatic signaling, there were thirty-nine signaling sections. Now there are sixty-nine and on the through fast lines there are twenty sections.

In 1919 the signaling from Praed Street station to South Kensington, which was an automatic bar-and-treadle system controlled by direct current, was

Digitized by Google

track circuited with alternating current, but the signals continue to be controlled by direct current.

Current for the supply of power to operate the power frame at Praed Street junction and at Baker Street is obtained from two 130-volt, 5-kw. motor-generators through suitable cables. These supply power for the operation of the points, the signal lamps and train stops, the electromagnets for back-locks and for the constant indication of power-worked points at Praed Street junction, and also for working the power frame at Baker Street, the total required for both boxes being 2.08 kw.

Power Consumption Is Small

For operating the track circuits, automatic and semi-automatic signals and train stops, between Praed Street, Bishop's Road and Edgware Road stations, and also between Edgware Road, Great Portland Street and Marlborough Road, and for four large illuminated train indicators at Baker Street, power is obtained from one 15-kw. and two 12-kw., 70-volt motor-generators in Baker Street substation, and the maximum power taken is 14-kw. The mechanical locking in the power frames is ordinary miniature tappet-locking controlled by levers in the ordinary way, the electric locking frame being behind the levers. Illuminated continuous diagrams are placed behind the frames lighted by 75-volt 5-cp. lamps.

All signals at junctions are electrically back-locked, an important safety device which in the further development of electric signaling has enabled point-locking bars to be dispensed with. At all running-stop signals there are train stops which are not connected to the signals mechanically, but electrically, and are controlled by the track circuits in the same manner as the signals, coming to clear and going to danger with the signal. They are also controlled by the track circuit independently of the signal, so that, if a signal failed to go to danger, the arm of the train stop would still go to the danger position.

All electric signals are either automatic or semi-automatic, the former controlled through the track circuits by the passage of the trains themselves, the latter controlled from a signal box when this is in use, but becoming automatic when not so controlled. Inside tunnels the signals are lamp signals, outside they are upper-quadrant semaphores worked by electric motors. Signals are held normally in the clear position by electric power, going to danger by gravity.

All signals are lighted electrically, and station masters light the signals half-way to the next station on either side, by means of a switch at their station. A hundred yards behind each stop signal in the open, fog repeater signals have been erected, the lights of which are placed at the level of the driver's eyes and as near as possible to the running line. By this means an indication is given to the driver whether the stop signal ahead is at clear or at danger, and if it is at danger he can slow up and avoid being tripped suddenly. The signalmen have fog repeater switches in the signal box by means of which they can light the fog repeater lamps when necessary.

Between junctions it is possible to have a number of trains, *e. g.*, between Finchley Road and Baker Street it is possible to have ten trains. For this reason Mackenzie Holland and Westinghouse train describers were installed, by which the signalman at Finchley Road is enabled to indicate to the Baker Street signalman whether the train terminates there, or is a through train to the city. All points where there are power frames are worked by the Mackenzie Holland and Westinghouse all-electric point machines. These machines are enclosed in a water-tight cast-iron case divided into three compartments. At one end is the motor, in the center are the gear wheels and motor switches, and in the other end is the worm drum that operates the points and the bolt that licks them both ways. Both point blades as well as the bolt lock are individually detected through an electric detector fixed in the 4-ft. way before the signalman can get his signal for a train to pass over that route. These point machines, says Mr. Wilcox, are most successful.

The track relays at Baker Street are of the single element vane type, the shunt by a train averaging 0.9 ohm. The relays used on the direct current system are of the three-coil polarized type, the shunt of which by a train averages 0.15 ohm. The most recent type of relay used is a two-element vane relay, the shunt of which by a train averages 3.4 ohms. The maintenance cost of this type of signaling is not excessive.

Automatic Signaling Cuts Costs

Before automatic signaling was installed there was 645 levers in use, whereas at present only 311 levers are employed, while the number of signalmen was reduced from eighty-six to twenty-seven and one-half. This meant in 1908 a saving of £127 (about $615 at then rate of exchange) per week on signalmen's wages, which at the present rate would be around £325 (about $1,483 at current rate of exchange). During 1920 the whole cost of maintenance—wages and materials—of the signaling of the electrified lines amounted to £123 per route-mile.

Charts have been kept from the beginning of automatic signaling in order to ascertain the number of delays to trains as compared with delays to trains with ordinary signaling, and the comparison works out very favorably for automatic signaling.

Tests have also been made with a three-position light signal as used on the Pennsylvania Railroad. The cost of maintenance is about the same as with two position semaphores, but the light signal appears to possess advantages in some respects, *e. g.*, in the entire absence of mechanical parts, and in the power of penetration of the light rays both in sunshine and in fog.

Power Test Codes to Be Discussed at Public Hearing

ON MAY 9, during the spring meeting of the American Society of Mechanical Engineers at Atlanta, Ga., a public hearing will be held for the discussion of the three additional power test codes which have reached this stage in their development during the past year. Last May at Chicago this committee, of which Fred R. Low, editor of *Power*, is chairman, presented codes on general instructions, steam engines and evaporating apparatus. It now presents codes on definitions and values, displacement compressors and blowers and hydraulic power plants, all three of which have appeared in *Mechanical Engineering*.

Although these codes have passed through six successive revisions in reaching their present form, the committee will welcome a full and frank discussion by the members of the society and others interested in these three subjects. Persons not planning to attend the spring meeting are invited to prepare written discussions.

Reprints of all three codes revised to date have been prepared by the committee and may be obtained by addressing C. B. LePage, secretary to the committee, at the society's headquarters, 29 West Thirty-ninth Street, New York, N. Y.

In 1918 the power test codes committee of the A.S.M.E. was reorganized to revise and enlarge the power test codes of the society, published in 1915. The committee is a large one, consisting of a main committee of twenty-five, under the chairmanship of Mr. Low, and nineteen individual committees of specialists who are drafting codes for the different classes of apparatus comprised in power-plant equipment.

Automotive Engineers Travel in Rail Car

WHAT was heralded as the first trip in history in which a scientific body has traveled any distance on a standard railroad in a motor rail car was made April 21 by New York members of the Society of Automotive Engineers, who traveled to New Haven to hear Prof. E. H. Lockwood of Sheffield Scientific School discuss power losses in motor-vehicle chassis. Some sixty-odd members traveled in the two Mack A.C. rail cars now in operation on the New York, New Haven & Hartford Railroad. Through the courtesy of the New Haven these cars were taken off their regular lines for the trip.

The average operating speed between the Harlem terminal and New Haven was 27 m.p.h., the speed varying according to traffic conditions. For instance, the average speed in the 16.5-mile stretch between New Rochelle and Stamford was only 20.2 m.p.h., whereas in the next stretch, Stamford to South

Digitized by Google

Norwalk, one of the cars made 36.4 m.p.h. The maximum speed was about 42 m.p.h., but at the higher speeds there was considerable vibration.

The two rail cars were placed in revenue service on Jan. 30, 1922, one covering an 11-mile route from New Haven to Derby and a 44.8-mile route to New Hartford. The second car runs from Litchfield to Waterbury, a distance of 36.4 miles. So far the two have covered about 23,000 miles in the service of the New York, New Haven & Hartford Railroad. Each car has seats for thirty-six passengers, with a 9 x 6-ft. baggage compartment located at the rear.

Industrial Engineers' Convention

THE Society of Industrial Engineers held its spring convention at Hotel Statler, Detroit, Mich., April 26 to 28. Of interest to electric railway men especially were the papers and discussions on conservation of material, plants and equipment, and labor and the workman.

Chamber of Commerce of the United States

AT THE tenth annual meeting of the Chamber of Commerce of the United States, to be held in Washington May 16 to 18, "European Conditions and Their Effect on American Business" will be the main topic. This announcement was made by the Chamber on April 24, when it made public a tentative program for the meeting. Because of the interest of business men throughout the country in the general subject it is predicted that the convention will be one of the largest ever held by the Chamber.

As in previous years the work of the convention will be done largely in group sessions. Groups representing the major divisions of business will take up the questions before the meeting in their relation to the particular interests or industries comprised within the group.

International Chamber of Commerce to Meet

THE American section of the International Chamber of Commerce has just announced that the next general meeting of the International Chamber will be held in Rome, Italy, the week of March 19, 1923. Before this meeting the International Chamber committees will be able to consider the results of the Genoa Conference in so far as they affect industry and commerce. Based on the views of these committees, constructive plans will be made as to such further steps as should be taken to restore the trade of the world.

The next meeting of the executive committee of the International Chamber will be held in Paris on May 26, and will be followed by a meeting of the board of directors on July 10. At that time plans will be made for the general meeting.

International Railway Congress

THE ninth congress of the International Railway Association is in session in Rome, Italy; the period covered by the congress being April 18 to 30. Abstracts of the reports to the congress on heavy electric traction in a number of important countries have appeared in the following recent issues of this paper: Dec. 3, 1921, page 988; Jan. 28, 1922, page 147; Feb. 25, 1922, page 322.

Canadian Association Convention Plans

THE program for the annual convention of the Canadian Electric Railway Association is complete except for a few details. It will be held at Quebec, June 1 to 3. An abstract of the program follows:

JUNE 1

9:00 a.m. Registration.
Address of welcome.
Business session, including address of president and reports of committees.
Inspection of exhibits.
1:00 p.m. Get-together luncheon.
2:30 p.m. Paper by member.
2:45 p.m. Sightseeing around Quebec by trolley (ladies).
4:00 p.m. Paper by associate member.
5:00 p.m. Inspection of exhibits.
7:30 p.m. Association banquet.
10:00 p.m. Dancing.

JUNE 2

9:00 a.m. Inspection of exhibits.
10:00 a.m. Paper by member.
11:30 a.m. Trip to Quebec Bridge by boat.
Informal buffet luncheon on board.
2:30 p.m. Paper by associate member.
4:00 p.m. Unfinished business.
Election of officers.
4:30 p.m. Inspection of exhibits.
9:00 p.m. Annual reception and ball, Chateau Frontenac.

JUNE 3

Inspection of exhibits, and trips to Montmorency Falls and to Saguenay River.

A. E. S. C. Activities

NINETEEN standards have now been approved by the American Engineering Standards Committee, of which four have been approved as "American Standard," fourteen as "Tentative American Standard" and one as "Recommended American Practice."

This number includes the specifications and tests for portland cement, for which the A.S.T.M. is sponsor, which have been advanced to the full status "American Standard." In the list also as "Tentative American Standard" are the specifications for drain tiles of the same society.

The A.S.T.M. has submitted to the standards committee its specifications for purity of raw linseed oil from North American seed and for purity of boiler linseed oil from North American seed, as well as its standard methods for chemical analysis of lead, tin, antimony and copper. Approval as "Tentative American Standard" is asked for these specifications.

French Street Railway Association

AN EXTENDED account of the meeting Oct. 20-23, 1921, of the Street Railway & Automobile Association of France (Union des Voies Ferrées d'Intéret Local de France et des Transports Publics Automobiles de France) appears in *L'Industrie des Tramways*. The papers presented included reports on track construction, car design, power generation and distribution, trackless trolleys, the financial condition of interurban lines, the reorganization of the Paris tramway and bus system, airplane lines, the engineering status of the bus and railway electrification.

American Association News

Camden Section Boasts 283 Active Members

AT THE April 20 meeting of the Public Service Camden Section President C. V. Wallace announced that the section is now the largest, having 283 active members.

The principal speaker at this meeting was former Judge John B. Kates. His principal point was the dependence of one man on another in the present social order. He pointed out that it is utterly impossible for any one to stand alone, whether he occupies the smallest job or one of the greatest responsibility. An employee is practically a nonentity when isolated. The electric railway employee has a definite niche to fill, and if he does his duty effectively, pleasing the people who depend upon him, he will be rewarded in proportion to the extent to which he discharges his obligations. This reward may be represented in ways other than the pay envelope.

H. T. Stevenson, assistant to the president of the Public Service Railway, spoke on salesmanship. He explained that while an officer of the company may see not over ten men a day, a trainman often comes in contact with 500 or more. In the long run public opinion is molded by the platform men. He told of an experience of a Public Service conductor who made a warm friend for the company of a newspaper editor by the simple act of offering him a fare when the editor had left his money at home. Afterward, by way of appreciation, the editor sent the conductor a gift.

At the close of the meeting the entertainment committee announced that the next meeting would be "radio night."

Home Rule Fight Staged

Campaign Started in Alabama to Have Regulatory Powers Returned to Cities

Preparations have been started for a fight at the next session of the Legislature to regain for the municipalities of Alabama the right to regulate the rates and service of their local utilities.

William L. Harrison, Commissioner of Public Utilities of the city of Birmingham, has taken the lead. On April 18 the City Commission adopted resolutions calling upon the Legislature to restore to the city its control over the rates and service of the Birmingham Railway, Light & Power Company, the Southern Bell Telephone Company and the Birmingham Water Works Company.

Steps for the formation of the statewide organization have already been taken. Letters are being sent out to every Mayor of cities or towns of Alabama which have public utilities of any kind. With these letters are being sent copies of the resolutions adopted by the Birmingham City Commission and the Mayors are being asked to have their Boards of Aldermen or the City Councils adopt similar resolutions. It is planned to call a meeting of representatives of all of the municipalities later.

Similar resolutions to those adopted in Birmingham have been presented to the City Commissions of Montgomery and Mobile. Commissioner Harrison and W. J. Wynn, City Attorney, made a trip to the two cities, where conferences were held with the commissions and assurances were given that Birmingham, Montgomery, and Mobile would act in concert and take the lead in the proposed fight to be waged before the Legislature at its coming session.

At the last session of the Alabama Legislature the public utility act was amended and all power to control or regulate either rates or service of local utilities was taken from the municipalities of the State and was vested in the Alabama Public Service Commission. This body was authorized to fix rates for all local utilities of the State and to prescribe the service regulations. It was also authorized to set aside contracts which had been made by the municipalities with the utilities.

The repeal of this amendment and the return of the right to regulate rates and service to the municipalities will be sought at the hands of the next Legislature, according to the plans now being worked out.

Commissioner Harrison stated that it is not the purpose of the city of Birmingham to open a fight on its utilities or on the Alabama Public Service Commission, but to regain some of the authority it has lost.

The city of Birmingham is now prosecuting a suit against the Birmingham Railway, Light & Power Company seeking to cancel its franchise because of increase in fare from 5 cents, as provided in its franchise, to 8 cents. The increase was granted by the Public Service Commission some time ago. The city is attacking the validity of the public utilities act on several grounds.

Democratic primary elections are to be held early in August and the general elections will be held in November. The meeting of the Legislature will take place some time later. Candidates running in the primary are in many instances making an issue of the Public Service Commission. Many have announced themselves in favor of curtailing its powers.

Asks Removal of One-Man Car Restrictions

The Jacksonville (Fla.) Traction Company, a Stone & Webster subsidiary, and now in receivership, has requested the city to eliminate the section of the ordinance regulating electric railway traffic which requires that a car crew shall consist of a conductor and a motorman. The company proposes to utilize one-man cars. Peter O. Knight, Stone & Webster counsel for the southeast, vice-president of the Tampa Electric Company, and General Manager T. J. Hanlon, Jr., have stated that the one-man car has been the major means of maintaining a nickel fare in Tampa.

Asks Winnipeg to Postpone Option

A. W. McLimont, vice-president of the Winnipeg (Man.), Electric Railway, has asked the City Council to postpone its option to purchase the railway from 1927 until 1937. In his letter to the Council Mr. McLimont stated that this would enable the company to float a satisfactory security and to care for the payment of all outstanding taxes, paving charges and damages caused by electrolysis; to complete the work of removing span wire poles, put wires underground and to make certain other recommended changes. The company, Mr. McLimont stated in this letter, will agree to extend its Talbot Avenue line from the present terminal to Panet Road and to make extensions on the Notre Dame and Academy Road lines, Notre Dame Avenue West Line, McGregor Street and Sargent Avenue lines, to enlarge the St. James subway for double tracking and to install bus service where necessary.

Detroit Preparing the Way

Forces Being Lined Up for Municipality to Take Over All Detroit Traction Lines

Initial steps are being taken in Detroit preparatory to the taking over of the Detroit United Railway city lines by the municipal street railway organization. The purchase agreement was ratified on April 17 and a bond issue voted to finance the initial payment and the purchase of supplies and miscellaneous equipment not included in the purchase plan but necessary for efficient operation by the city. An appraisal has been begun and an inventory is being made, including construction materials such as rails, ties, cement and miscellaneous materials.

It is the endeavor of the city officials to complete the inventory before May 15, the date set for the transfer. Officials of the municipal organization plan on taking over the lines with as little interruption of service as possible. Every effort will be put forth to insure efficient operation from the very beginning and to improve the service.

It has been announced by the municipal officials that as many of the present Detroit United Railway employees will be retained as can be used by the city and that preference will be given to employees who are inclined to work along the lines followed by employees of the present municipal lines and in accordance with the ideals of the officials of these lines. The first and most important aim will be to give courteous and efficient service.

It is planned to have a large number of uniformed municipal ownership employees stationed in the congested downtown districts at the most important points to aid in directing traffic.

An increase in the efficiency of the present Detroit United Railway employees has already been noticed since the city voted to take over the Detroit United Railway lines. No further developments have been reached in regard to the wage cut proposed by the Detroit United Railway earlier in the month, and it now appears unlikely that the wage question will be settled before the transfer is made and the lines are being operated by the city. The present plan is not to reduce wages.

Figures as to operating revenue of the Detroit United Railway for the first three months of the year have been submitted to the city by the company. This is the first report of this nature received by the city and the figures will be used as a basis in making up the budget for the entire municipal system combined with the present Detroit United Railway system for the coming year.

Elevated Lease Reported Negotiated

At a conference at the Mayor's office on April 27 attended by Mayor Moore, Thomas E. Mitten, president of the Philadelphia Rapid Transit Company, and Richard Weglein, president of the City Council, an agreement is said to have been reached by which the Philadelphia Rapid Transit Company will operate the Frankford elevated line for the city. The rental terms which the company will share are 1 per cent in 1923; 2 per cent in 1924; 3 per cent in 1925; 4 per cent in 1926; 5 per cent in 1927. The operation of the road will begin Nov. 5 of this year.

Mayor Moore announced after the Frankford "L" conference that the lease agreement would terminate at the end of five years unless the city gives notice that it wishes the lease continued.

In a statement the Mayor said President Mitten asked for co-operation of the administration and councilmanic forces of the city government in transit matters, and while assured of such co-operation it was pointed out that the city would reserve its rights under the 1907 agreement, the valuation proceedings and others of a legal nature.

It was also stated that the matter of extensions was discussed and it was announced that now that the Frankford "L" lease was out of the way, efforts would be made to extend the Philadelphia Rapid Transit System into sections of the city not now provided with service.

Commission Reiterates Its Rate Deflation Policy

In a summary of its decisions issued on April 24 by the Public Service Commission of New York, it is shown that gas, electric light, telephone and electric railway rates throughout the State have been materially reduced since the commission was appointed to office last April by Governor Miller. Furthermore, the policy of the commission, as expressed in the reduction orders, indicates that the commission intends to continue the rate reducing process as the costs of labor and materials decline.

In this connection the statement of the commission refers to an opinion rendered last fall by Chairman William A. Prendergast refusing an increase in fares in Utica, and concurred in by Commissioners Pooley, Van Voorhis, Semple and Blakeslee. In that decision, reviewed at length in the ELECTRIC RAILWAY JOURNAL at the time, the attitude of the commission regarding all public utility rates was set forth as follows:

> Public utilities, just as other departments of business, must expect to cope with periods of depression and short earnings, just as at other times they enjoy periods of prosperity and full dividends. If the public is expected to make up every deficiency in order to give a utility a good round rate of earning power, then the public is entitled to the benefit of the surplus over the agreed upon earning rate in times of prosperity.
>
> It must be borne in mind that we are not dealing with the conditions of 1920, nor with the previous abnormal years, but with the present period, which is one of profound economic readjustment. It is with this pregnant fact before us that a decision in this and similar cases must be made.

The commission, up to date, has put into effect about forty orders calling for reduction in rates or suspending proposed increased rates asked for by public utilities. In only seven cases have increases been permitted, and these of a very slight nature to gas and electric light companies in up-state communities where the cost of service is larger than in crowded sections because of the scattered population.

All of the reductions so far ordered are temporary and were made by the commission before the investigations into the various companies were completed. A further revision of these temporary rates will be made at the conclusion of the various hearings.

Learn About Dallas.—A special Dallas edition of "Partners," the official paper of the Dallas (Tex.) Railway, was issued under date of April 5, 1922. It contains some interesting facts and all possible information on the city of Dallas, compiled by the Dallas Chamber of Commerce. With its historical résumé and fine views this copy of "Partners" is something to keep for future use and reference. The pamphlet says that the effective sale of transportation must be based on knowledge of the city. If the Dallas trainmen assimilate one-half of the story they will certainly be living up to their reputation, namely, the best informed group of men in Dallas when it comes to giving information about Dallas.

Suits to Demand Electrification

Suit will be instituted by the municipal authorities of Buffalo, N. Y., against the seventeen railroad lines entering the city to force the companies to file plans for the electrification of their lines. Last November the City Council adopted an ordinance calling for electrification of the railroads by Jan. 1, 1923, and the filing of such plans with the city by Jan. 1, 1922. The failure of the lines to file the plans will prompt the suits. The railroads against which suits are threatened by the City Council are the New York Central, Pennsylvania, Delaware, Lackawanna & Western, and ten others.

Maurice C. Spratt, attorney for the New York Central, says the railroads have no intention of complying with the resolution of the Council, first because of the excessive cost and second because the city has no legal authority to compel the roads to expend such a large sum of money. Railroad engineers have estimated that it would cost the seventeen railroads entering Buffalo about $116,000,000 to comply with the ordinance. The Erie Railroad's share alone would exceed $22,000,000, a sum it could not possibly raise, Erie officials say.

Hearing Held on Bacharach Bill

Another hearing was held in Washington before the House judiciary committee on April 25 to consider the Bacharach bill, which would limit the jurisdiction of federal courts as to injunctions in matters pertaining to state public utility orders. The hearing was held before the whole committee, the time being given to the advocates of the measure. Another hearing will be held May 23. Mayor Hylan of New York, Ledyard P. Hale, counsel for the New York State Public Service Commission; John P. O'Brien, Corporation Counsel of New York, and John E. Benton, representing the National Association of Railway & Utilities Commissioners, were among those who appeared before the committee. Among those who listened to the testimony in opposition to the bill were E. A. Harriman, member of the legislative committee of the American Bar Association, and Senator Charles S. Thomas of the Bar Association of Colorado.

The witnesses in behalf of the bill voiced the complaint that state commissions are interfered with by the federal courts. They claimed that as exact justice can be had from the state administrative bodies and the state courts as from the federal courts. The indicated answer to this contention is that, while it is doubtless true in local matters, investors who are not residents of the state naturally look to the federal courts for protection.

Mayor Thompson of Chicago is to be heard on May 23, when the hearings on the measure will probably be concluded. The committee has given a great deal of time to the bill and has had a full explanation of its object. It was evident at the hearing that the opposition to the bill is very strong, especially in states where money is wanted for the extension of railroads and the development of natural resources. It was announced at the hearing that the committee had received telegrams from a number of state commissions opposing the bill on the ground that it would have a tendency, if enacted into law, to exclude capital from public utility enterprises.

Kinsella Mayor of Hartford

Richard J. Kinsella was elected Mayor of Hartford, Conn., April 4, after a campaign in which reduction of car fares was an important issue. Reduction of fares on the lines in Hartford of the Connecticut Company, isolation of the Hartford Division from the state system and curtailment of suburban trolley service during non-rush hours, which he announced as part of his traction plank for the campaign, met with disapproval among business men and taxpayers. They declared that this plan would increase unemployment, inconvenience the public and turn away shoppers from the city. Mr. Kinsella was elected Mayor four years ago, but was defeated at the next election.

Right to Permit an Abandonment a Commission Function

The Montana Public Service Commission was granted final authority over the electric railways of the State in a decision delivered recently by Associate Justice Holloway in the Supreme Court. Judge Holloway reversed action of the Lewis and Clark County District Court in refusing the city of Helena an injunction against the Helena Light & Railway Company.

The railway had announced its intention of abandoning the Kenwood branch on the west side of the city. The city asked an injunction on the ground that the company was violating its franchise. The lower court refused to enjoin the company. The city appealed.

In its decision the higher court held that the Public Service Commission had the power to decide whether the railway had the right to abandon any of its lines on account of heavy losses sustained by insufficient business. Until the state body has acted, it was held, the company must discharge its obligation under its franchise.

Seattle Must Say Yes or No

The question facing residents of Seattle, Wash., at the election on May 2 is this: Shall they accept the proposal to support the municipal street railway by taxation, or shall they refuse it? If they accept it, fares will be reduced from the present 8½ cents to approximately 3 cents. If they refuse it, fares will stay where they are.

Advocates of the proposal for taxation maintenance say that the increased taxation will be more than offset by the reduction of fares. Opponents insist that increased taxes will drive away business. It has been estimated that the new plan would involve an increase in taxes varying in amount from $5,500,000 to $6,000,000, or between 20 and 22 mills. The total tax rate would approximate 85 mills. The proposal was brought to vote by an initiative petition. The plan was reviewed in the ELECTRIC RAILWAY JOURNAL for March 25, page 534.

Mayor Wants a New Deal

Mayor Hosey of Fort Wayne, Ind., has indicated that the Indiana Service Corporation, Fort Wayne, Ind., will be asked to enter into a new agreement with the city similar to the one surrendered when the company's operation passed completely under the supervision of the State Public Service Commission.

Two petitions of franchises to improve the city lines have been presented to the Board of Works by the company, one for the proposed double tracking of Pontiac Street and the other for the double tracking of South Wayne Avenue. Neither petition has been acted upon, although they have been on file several weeks. Mayor Hosey indicated that permission to carry on the work will not be granted until the company enters into a new agreement or franchise with the city.

In an effort to settle the Pontiac Street double-tracking proposition, which has been opposed by the residents of Pontiac Street, the railway called a mass meeting of the citizens in that section of the city at the neighborhood school, where it presented its side of the case. The company holds that the Pontiac line carries more traffic than any other line in the city, that new tracks are absolutely necessary and that the amount of traffic on the line will be greatly increased when the International Harvester Company's plant in the eastern end of the city is completed. The meeting was advertised in the local papers and the purpose of the meeting frankly stated in these advertisements.

Publicity Activities Approved by Commission

During various cases before the California State Railroad Commission in recent months in which public utilities have sought increases in rates, several contestants against the commission granting an increase have objected to the expenses for publicity contained in the operating expense exhibits offered to the commission by the utility companies. The contention has been advanced that utilities are not entitled to charge to their operating expenses the cost of advertising and expect the public to pay for it in the manner of increased rates.

To set the public right on this particular issue President Harley W. Brundige of the California State Railroad Commission has given his unqualified approval to the reasonable use of newspaper space by power and other public utilities of the State to promote and extend their business.

Franklin Hichborn of San Francisco questioned the commission as to the right of public utilities to charge advertising to operative account, especially in territory where competition is not a factor. Mr. Brundige has answered this gentleman by letter and has described newspaper advertising by public utilities as the most effective and cheapest form of salesmanship.

The protest to the commission followed the insertion of an advertisement by the Pacific Gas & Electric Company of San Francisco in a Santa Clara County publication, a region where the corporation holds a monopoly.

That utilities in certain fields do not have serious competition does not affect the proper use of advertising, Mr. Brundige contended, and he further pointed out that modern advertising seeks to create new business rather than to take business away from a competitor.

Mr. Brundige held that when advertising is reasonably and wisely used, measured by results obtained, and is not of the political propaganda type, it is a legitimate operating expense.

Reviews Boston Elevated Situation

James F. Jackson, chairman of the board of trustees of the Boston (Mass.) Elevated Railway, in a letter to Walter R. Mein, president of the United Improvement Association, recently stated that the present 10-cent fare could not be lowered until towns upon which the deficit of 1919 was assessed were paid back the money loaned by them. This amounts to $4,980,151.

Mr. Jackson's letter is a reply to the questions and suggestions presented at a conference between the Boston Elevated Railway and the United Improvement Association on Jan. 30.

To replace the worn-out equipment of the railway with new and modern material and to bring the service to an efficient point would cost about $6,000,000, according to Mr. Jackson. In three years the annual reserve for depreciation would care for the expenditures which normally should be cared for by current revenue.

The reserve for depreciation, said Mr. Jackson in his letter, is not being set aside as a capital asset. It is, instead, the fund which is being used by the trustees to replace deteriorated equipment. With it were purchased the majority of the 300 new center-entrance cars and eighty one-man cars, sixty-five elevated cars and forty Cambridge subway cars.

The 5-cent fare areas established between each of the long-distance trunk lines is, according to Mr. Jackson, part of the company's theory of developing a local service at a low fare which is "consistent with the flat fare that distributes population from congested centers to outlying districts and that can be made lower as relief from burdens and lessening costs permit."

Transportation Department for City in Prospect

The abolishment of the Department of Public Utilties, and the creation of a Transportation Department, making the Seattle (Wash.) Municipal Railway a separate branch of the city government, is proposed in an ordinance passed by the City Council, which will be submitted to the voters at the May 2 election as a charter amendment. Councilman Oliver T. Erickson, author of the amendment, claimed that the State under recent legislation has taken over most of the work performed by this branch of the city government. The Council was in favor, as a unit, for the charter amendment constituting the city's railway and bus system a separate and distinct department of the city government, and its executive head a member of the board of public works. As approved, the amendment creates the Department of Transportation, with a superintendent of transportation at its head, this official to be appointed for a three-year term by the Mayor, subject to confirmation by a majority vote of the Council.

Financial and Corporate

Interborough Asks $400,000,000

This Value Is Placed on Rapid Transit Lines as Company's Price for Entering Transit Plan

James L. Quackenbush, counsel for the Interborough Rapid Transit Company, New York, N. Y.. served notice on the Transit Commission on April 21 that it could not hope to take over the Interborough at the figure of $174,-221,056 recommended by the commission's valuation bureau. He put in a company value of $399,873,697 and indicated that somewhere between these two figures there might be a chance of getting together on a price to be paid for turning the property over to the city for operation in connection with the proposed city-wide traction reorganization plan.

The statement was made at the opening of the valuation hearing which was begun on April 21 before the commission. Interborough figures were taken up first and there was a sharp clash between Clarence J. Shearn, special counsel to the Transit Commission, and the Interborough counsel. Mr. Quackenbush threatened to walk out of the hearing unless he was allowed to present the I. R. T. case as he saw fit and without what he termed "ungentlemanly interruptions." Chairman McAneny poured oil on the troubled waters and the matter was smoothed over.

Mr. Quackenbush wanted the commission to adopt a plan of arbitration to consider the figures of the chief engineer of the Transit Commission upon which the valuations were based. He claimed that the Transit Commission had this right under the dual subway contract. William A. De Ford objected and said that the Transit Commission should not be bound by any such arbitration.

It was decided that it might be feasible to go over the engineer's figures, which were the base figures upon which the valuations were built, in an arbitration with the city, the Transit Commission and the company represented. The commission, however, insisted upon the company bringing out its arguments against the Transit Bureau values at the opening hearing, and this proceeding was followed. The first witness was the Interborough Rapid Transit Company auditor, Edward F. J. Gaynor, who testified on the company figures.

Mr. Quackenbush said that, whereas the commission's valuation bureau had arrived at its figures by taking the cost to produce the property and deducting from it the cost of depreciation or the sum necessary to put it in first-class order, the company held that since the case was not a rate case, but one in which the commission sought to take the property away from the company, it must use a different method of fixing value. A rate fixed on the basis followed by the valuation bureau, Mr. Quackenbush held, could be changed if found unsatisfactory, but in this case there was no chance for correction. His company, he contended, should be allowed a price equal to the value of the property as of today, with the company allowed all the advantages of increase in values due to advance in market costs.

He said that as the commission had presented the "minimum value" it was the duty of the company to show the maximum. "That does not mean," he said, "that some lower figure might not ultimately be accepted. Somewhere between may be the figure that may be arrived at between the parties, as frequently is the case in all negotiations."

Mr. Quackenbush declared that nothing he said must be taken as an ultimatum that the company would not eventually reach an agreement with the commission. He declared, however, that "the method adopted by the valuation bureau in reporting the lowest possible value could not be adopted by the commission with any hope of success."

"However," he said, "I cannot imagine that the commission can hope or expect that the thousands upon thousands of security holders who have purchased notes and bonds to the extent of $200,-000,000 will consent to accept anything less than the face value of those securities."

In discussing the conferences in 1919 he declared that the inquiry into the affairs of the I. R. T. begun by Mayor Hylan had "blanketed at that time any chance of bringing about a reorganization of the traction companies."

The values for the I. R. T. property, according to the auditor's charges, and on the basis of prices of March, 1922, are shown in the accompanying table.

RECAPITULATION OF BOOK COST OF INTERBOROUGH RAPID TRANSIT COMPANY PROPERTY DEVOTED TO THE PUBLIC SERVICE TOGETHER WITH VALUE OF SUCH PROPERTY FOUND BY REVISING BOOK COST TO CONFORM TO PRICES PREVAILING IN MARCH, 1922

Title	Auditor's Charges		Charges Revised to March, 1922, Prices	
Contracts 1 and 2	$51,832,542(a)		$91,392,741	
Contract 3 and additions	108,079,433		174,113,997	
Belmont Tunnel (less $3,000,000)	9,068,329		5,895,174(b)	
Working Capital:				
Supplies	1,769,647(d)		1,769,647	
Cash	1,788,206(e)		1,788,206	
Totals		$172,538,157		$274,959,765
Manhattan third tracking	$22,033,751		$29,146,933	
Elevated extensions	13,818,096		18,101,536	
Manhattan power plant improvements	6,035,645		9,023,048	
Additions to company lines	341,350(c)		341,350	
Working Capital:				
Supplies	94,381(f)		94,381	
Cash	80,684(g)		80,684	
Totals		$42,403,907		$56,787,932
Grand totals or value of property for rate case		214,942,064		331,747,697
Add value of lease		68,126,000		68,126,000
Value for purpose of sale or exchange		$283,068,064		$399,873,697

(a) Does not include amounts paid in stock or cash to acquire Subway Construction Company assets and McDonald's one-quarter interest in subway lease.
(b) These figures represent auditor's charges with revised interest and taxes based upon a reasonable construction period. Cost of Belmont Tunnel (except the $3,000,000 allowance) not brought up to 1922 prices.
(c) Not revised to 1922 prices.
(d) This represents 60 per cent of total operating supplies carried for entire subway and Manhattan system.
(e) This sum represents one month's operating expenses and is a fair and reasonable allowance for cash working capital.
(f) Supplies on account of elevated extensions.
(g) One month's operating expenses of elevated extensions as cash working capital.
The figures for contracts 1 and 2 Belmont Tunnel are based upon auditor's records of Dec. 31, 1921, and as to contract 3 and certificates they are based upon auditor's records of Jan. 31, 1922.
The figures for operating supplies are based upon the book cost of the supplies in hand Feb. 28, 1922, and the cash part of working capital upon operating expenses for the month of January, 1922.

Short Abandonment Approved

Approval of the application of the Public Service Railway, Newark, N. J., to abandon its tracks and service on Main Street, Metuchen, between Benner's Corner and Amboy Avenue, has been received by the company from the Board of Public Utility Commissioners. At the same time the board dismissed the application of the Borough of Metuchen for discontinuance of a transfer charge on this same line.

The annual revenue for the line for 1921 was $1,807 and the cost of operation was $21,020. When the Public Service Railway took over the lines of the Brunswick Traction Company and the Raritan Traction Company, consolidating them into the Middlesex line, operating between New Brunswick and Perth Amboy, the shuttle service was started to carry out the franchise requirement. The distance was less than a mile.

It is probable that the company will ask the commission for permission to abandon its extension on Burnet Street, New Brunswick, N. J. The company is anxious to abandon the line because it is being operated at a loss and because of the cost it would have to bear when the street is repaved.

Conditions Improved

Survey for 1921 Shows Greatest Improvement on City Lines—Better Business Conditions Will Help Interurbans.

The financial condition of city electric lines is steadily improving, but this improvement has not yet reached the interurban lines. This is the outstanding fact revealed in the review of conditions in the industry based on official revised operating returns from 180 companies representing more than 50 per cent of the total industry in the United States for the year 1921 and subsequent supplemental reports.

Of these lines 103 are city lines and seventy-seven interurban. Their total operating revenue for 1921 was $437,493,853, as compared with $650,149,806 for the entire industry as reported by the United States Census for 1917.

The actual volume of business shows a slight decrease over 1920, but improved operating conditions have helped finances. The outstanding feature of the combined reports as made public by the information bureau of the American Electric Railway Association is the increase in net income after the payment of all expenses and charges. In 1921 this amounted to $22,022,722, as compared with $7,709,261 in 1920. In the face of the unusual business depression in 1921 with unemployment at the maximum, this net income figure is considered remarkable. As the association sees it, however, the figures are merely indicative of the great underlying strength of the industry, the real necessity for the service which it rendered and its ability to withstand serious industrial disturbances.

Traffic on these 180 properties fell from 7,606,190,270 in 1920 to 7,144,332,920 in 1921, a decrease of 6.1 per cent. The total operating expenses of these 180 companies decreased from $340,972,180 in 1920 to $327,178,121 in 1921, a drop of 3.5 per cent. The operating ratio dropped from 78.4 per cent in 1920 to 75.2 per cent in 1921.

The net operating revenue as a result of increased revenues and lowered operating expenses increased from $93,916,654 to $108,315,732, or 15.5 per cent. Net revenues from auxiliary resources increased $1,785,246. The surplus created by this increase was cut down slightly by an increase of $2,541,576 in taxes.

The net income of $22,022,722 earned in 1921 amounted to 5 per cent of the total operating revenue, whereas in 1920 it amounted to only 1.8 per cent.

As for the interurban field, a hopeful sign is the decrease in the operating expenses of these companies, which is relatively greater than that of the city companies.

Expenditures for maintenance of way and structures of 180 companies, both city and interurban, were 7 per cent greater in 1921 than in 1920, while expenditures in other departments show substantial decreases, due probably to the cost of labor and materials. The cost of conducting transportation of these 180 companies, the principal item in which is wages of trainmen, was $6,903,353, or 4.6 per cent less than in 1920. The companies ran 18,653,967 fewer car-miles than in 1920. Power costs showed the largest decrease of all the items making up operating expenses.

One-fourth of all passengers riding used transfers, a slight increase over the number using transfers for 1920.

The figures in detail on which the foregoing statements are based are contained in the accompanying tables.

District Merger Agitated Again

The Public Utilities Commission of the District of Columbia is looking into its organic act to determine if it can authorize a merger of the Washington Railway & Electric Company and the Capital Traction Company in Washington. The merger question has been agitated for some time on the ground that it is the only solution for the existing traction difficulties—one company requiring a higher rate of fare than the other, although the commission has prescribed a uniform fare, which yields a greater return to one company than the other. Merger legislation has been proposed in Congress, but no action has been taken owing to conflicting views. The commission has requested the Corporation Counsel of the District for an opinion as to whether its organic act empowers it to merge the two lines.

Receivers for Queens Lines

Justice Stephen Callaghan, in the Supreme Court at Long Island City on April 28, handed down a decision appointing S. W. Huff, president of the Third Avenue Railway, and Robert C. Lee, an insurance broker, as receivers for the New York & Queens County Railway. The appointment was made on the application of the Guaranty Trust Company, New York, N. Y., as trustee under the first mortgage of the Steinway Railway of Long Island City, dated 1892. In its application for a receiver the Guaranty Trust Company declared that the company defaulted on Jan. 1 in the payment of $45,000 interest due on the mortgage of $1,500,000.

New York Bankers Acquire Power Company Control

A. E. Fitkin & Company, New York, N. Y., have acquired control of the Tide Water Power Company, Wilmington, N. C., a city of 35,000 population, it was announced on April 27. The properties taken over in the deal include an electric light and power plant, a gas plant and electric railway systems serving the North Carolina city and interurban territory. The interurban line runs 12 miles to Wrightsville Beach on the ocean, where the company has an amusement pier, a casino and a large auditorium for convention purposes.

Discuss Purchase of Market Street Railway by City of San Francisco

The question of the best methods of procedure in the acquisition of the Market Street Railway by the city of San Francisco has been the subject of recent conferences between city and company officials. The city has been represented by George Lull, city attorney, and the company by William Von Phul, president, and William N. Abbott, chief counsel.

The plan of purchase now being discussed is based upon the method provided for in charter amendment No. 30 passed by the voters on Nov. 2, 1920. A $14,000,000 bond issue would have to be passed to pay off the company's indebtedness that falls due in 1924 and the remainder of the purchase price would be paid out of the earnings of the system on the pay-as-you-go basis, the city to contract to pay a guaranteed amount each year.

The $14,000,000 bond issue would require a two-thirds vote. The bonds could be made to cover a period of years ample for the city to redeem them. It would also be necessary to amend the city charter to allow the city to operate the San Mateo branch of the company which goes outside city limits.

The price has not been decided, but it is expected to be in the neighborhood of $40,000,000. This is the value of the property as estimated by M. M. O'Shaughnessy, city engineer. If that were to be the agreed price the city would pay $14,000,000 in bonds in 1924 and the remaining $26,000,000 out of earnings of the utility. Mr. Lull states that this would be the most advantageous method of procedure for the city and would be well within the city's limit of bonded indebtedness.

Joliet & Eastern Traction Stops Service

The Joliet & Eastern Traction Company, Joliet, Ill., operating a 23-mile interurban line between Joliet and Chicago Heights, discontinued service on April 15. Permission to cease operation and junk the property was given by the Illinois Commerce Commission when it was shown that the road was no longer financially able to continue business. The petition for discontinuance was filed with the commission by Receiver Eckmann several months ago. The road will be dismantled in the near future.

The action on the part of the railway was brought about by the coincident necessity for the expenditure of a considerable sum of money for changes in its property that in no way would benefit the railway or increase the value of its service. The largest expenditure impending was at Matteson, where the railway would have been obliged to remove its overhead construction to allow the elevation of the tracks of the Illinois Central Railroad. Other obligations, such as paving charges, track changes, etc., caused by city improvement, have come also at this time. The railway exhausted its reserve some time ago and has been operated at a loss, though every means of increasing the revenue has been tried. Besides its passenger service, the railway was giving a freight and package service and carrying the mails.

The underlying reason for discontinuing operation, however, as stated by E. H. Stearns, secretary of the company, was the increased use of private automobiles. Their popularity and number have rapidly been increasing and the completion soon of a cement highway paralleling the railway's right-of-way will make electric interurban service still more impracticable. The railway has also had to operate in competition with the Michigan Central Railroad and the Elgin, Joliet & Eastern Railroad between Joliet and Chicago Heights.

The company's property consists of 25 miles of single track, five motor passenger cars, three motor freight cars and two other cars. The company purchased energy from the Public Service Company of Northern Illinois. The repair shops were located at Frankfort.

The company was incorporated in Illinois in 1914. It represents the reorganized portion of the Joliet & Southern Traction Company, operating between Joliet and Chicago Heights. The property was appraised by the Illinois Commission, which authorized stock to be issued to the amount of $269,000 and additional $31,000 for cash received. There is outstanding $300,000 capital stock, but no bonds.

Resumes Partial Payment

The Third Avenue Railway, New York, N. Y., resumed partial payment of interest on the adjustment 5 per cent bonds this month, with the payment of 1¼ per cent. There still remains 22½ per cent interest on these bonds in arrears, which must be paid before there can be any return to the stockholders. However, the critical stage of the affairs of the company is past. These facts were contained in a letter to a stockholder who suggested that a protective committee of fifteen be organized. S. W. Huff, the president, stated that since the company is not in the hands of receivers the directors are in fact the stockholders' committee. The company also has protested against the valuations placed on the properties of the Transit Commission in a letter by Mr. Huff to the commission. Mr. Huff makes the statement that the cost to reproduce the property even with allowances for depreciation would be more than twice the amount recommended by the engineers for the commission.

Toledo $87,000 Ahead for March, 1922, Over Similar Month in 1921

As a result of March operations of the Community Traction Company, Toledo, Ohio, there has been added to the fare stabilizing fund $13,549, an increase over the credit for February of $8,619. Gross revenue for the month amounted to $307,827 as compared with gross revenue for February of $281,196, the increase in this instance being entirely due to the greater number of days in March.

The ratio of operating expense to gross income of 69.405 per cent was a slight decrease from the operating ratio for the month of February.

During the month there were operated 639,656 car miles as compared with 574,221 for the previous month. Revenue passengers per car mile of 7.76 represents a decrease of 0.15 passenger per car mile as compared with February.

During the month there were carried 4,965,140 revenue passengers while for the same month last year there were carried 5,710,010, a decrease of 744,879. By reason of operating economies and despite the decrease in riding it was possible to show a surplus of more than $13,000 for March this year as compared with a deficit of $73,755 for the same month last year.

Ordinance requirements as to credits to the various funds and reserves have been complied with, and, in addition, interest earned on bonds retired amounting to $745 for the month has been added to the sinking fund.

Seeks Termination of Receivership

The Binghamton (N. Y.) Railway has announced its intention of applying for the sale of the property and the discharge of the receiver.

Traffic and Transportation

Fares Discussed in Dallas

City Contends Company Has Not Lived Up to the Terms of Temporary Fare Increase

Hearings are now being conducted in Dallas, Tex., before the City Commission on a proposal to order the Dallas Railway to restore the 5-cent fare as provided in the franchise granted in 1917. The hearing was opened by the city when it was disclosed that the Dallas Railway had used $500,000 of its earnings under the 6-cent fare over and above the 7 per cent authorized return under its franchise, in payment of past-due dividends.

The company claimed that the franchise guaranteed a return of 7 per cent on its investment, and that all unpaid dividends should be paid out of excess earnings before any of such earnings were used in improvements, betterments or for any other purpose.

The city in turn claimed that the 6-cent fare was granted in 1920 under the express provision that the earnings thus made possible would be used in street paving and other improvements ordered by the city and claimed by the company to be impossible because of inadequate returns.

At the opening of the hearing, Attorney J. A. Worsham, representing the railway, filed a lengthy statement setting forth the position of the company. To the statement was appended a table showing receipts and disbursements for 1921.

The statement, as read by Mr. Worsham, attacked the fairness of the 1917 franchise given the company by the city on the grounds that its provisions do not afford a sufficient maintenance and depreciation fund. The statement stressed the point that under the 6-cent fare a maintenance fund of only $9,000 is on hand, when the company claims a sum of $1,000,000 should be afforded. Mr. Worsham said:

> It has been proved that the authorized return of 7 per cent that the company receives under the terms of the franchise now in force is inadequate, and that 8 per cent would be a fairer rate. The company can barely subsist on the present schedule, and the reduction of the fare to 5 cents will lead to bankruptcy for the company and total loss to its stockholders.
>
> The property value stated in the franchise is $9,333,000, while the actual property value is closer to $13,000,000. The whole thing is simply a matter of calculation. The amount of return necessary to operate this business successfully is a formula that can be deduced from a consideration of the property value involved, the receipts, the disbursements and the depreciation that must be allowed for.
>
> The question of fare is not contractual. We maintain that instead of a 7 per cent return, 8 per cent would be fairer, and that at least 4 per cent should be allowed for depreciation to property and 2 per cent for depreciation of buildings.

Interesting testimony regarding the condition of the Dallas Railway's properties was given by Richard Meriwether, vice-president and general manager. Mr. Meriwether said that when the Dallas Railway was first requested in the fall of 1920 to assist the city in the paving of certain streets on which it had tracks, it was unable to do so because it had no funds and no credit. It will be able to help now to the extent of $101,000, Mr. Meriwether said, because it will be able to borrow this sum from its stockholders.

In summing up the situation confronting the company Mr. Meriwether said:

> The company is in an embarrassing financial position now, and unless relieved within the next two years, in some manner, the situation will become gravely embarrassing. There is $60,000 due on Lamar Street improvements now, for example, and only $9,000 available, unless we are permitted to borrow from the stockholders.
>
> The 18 per cent reserve that has been set aside under the terms of the 1917 franchise is not enough to care for the actual repairs to rolling stock and tracks.
>
> Two of the leading lines in the city, the Ervay line and the Bryan line out Live Oak, are in bad condition. They must be repaired. They each make about $21,000 a month. The Bryan line situation could be taken care of by routing the cars across Cantegral and down Swiss, but there is no way to meet the Ervay Street emergency. These are two of the heaviest traveled routes in the city.
>
> All the officers have discussed the fact that the property is wearing out and that there are no funds available to replace it. The stockholders know that the company is skating on very thin ice. The rate payer of the past hasn't been made to do his part. A collapse of the company will not only be a calamity to the stockholders but to the public as well.
>
> The money disbursed to the stockholders belonged to them under the terms of the franchise. The fund that it was applied on is still $558,000 in arrears.
>
> Some of the double-truck cars in the city now have been in service for eighteen or twenty years. The company owns 138 double-truck cars and sixty-eight single-truck. It leases fifty big double-truck cars from the old Northern Texas Traction Company. These latter cost probably $6,500 apiece. The others about $5,000. The life of the average car is twenty years, and about 25 per cent of those now in operation here should be replaced.

Right to Examine Books Established

Through an order by Judge H. D. Dickinson of the district court on April 21, the city attorney will have only one day to examine the books of the Twin City Rapid Transit Company, Minneapolis, in case they are produced, before the hearing on an alternative writ of mandamus petition. The proceedings have been established to disclose the relationship between the Minneapolis Street Railway and the Twin City Company. The judge on April 21 continued the time for the company to answer a motion to show why the books should not be produced to April 24. The other hearing had been set for April 25, the day following. The city wants to inspect these books and records to prepare its case for the mandamus suit hearing. The company alleges these books have nothing to do with the Minneapolis Street Railway case. The extension of time was given on request of counsel for the railway.

Commutation Rate Fixed

New Jersey Board Authorizes Monthly Ticket Based on Modification of Muscatine Plan

As an experiment in evolving a satisfactory plan of providing necessary revenues, the Board of Public Utility Commissioners of New Jersey has granted permission to the New Jersey Central Traction Company to establish a base rate of 10 cents in each of its seven fare zones with a form of commutation ticket under which lower rates may be obtained by more frequent riders. The new plan is to be put into operation within four weeks and is to receive a six months trial.

The plan authorized by the board is that riders desiring to do so may purchase a commutation ticket, paying $1 for each zone in which they desire transportation. The commutation ticket so issued is to be good for one calendar month and is to entitle the holder to transportation for not more than 100 rides a month at the rate of 5 cents per ride. Any passenger traveling beyond the zone covered by his commutation ticket will be required to pay the base rate of 10 cents. Under the plan a person holding a commutation ticket for one zone, for which he pays the monthly flat rate of $1, will pay a total of $6 if he takes 100 rides a month, or a 6-cent fare.

The commutation rate would increase in proportion to the diminishing number of rides, so that a person riding only twenty times a month would pay the base rate of 10 cents. The commutation plan suggested by the company as a substitute for a flat increase in fare contemplated the purchase of commutation tickets for $1.50 in each zone. This plan would have resulted in a minimum fare of 6½ cents, instead of 6, and the base rate of 10 cents would be reached by the passenger riding thirty times a month instead of twenty times, as under the $1 rate fixed by the commission.

In behalf of the objecting municipalities it was contended that the proposal to charge $1.50 a zone was too high and would discourage the purpose of the entire plan. In this estimate the board assumed that 22 per cent of the total cash fares would become commutation fares. It also assumed that holders of commutation tickets would ride more frequently, causing an increase of 20 per cent among such riders. Of the remaining 78 per cent not holding commutation tickets the commission assumed that 10 per cent would cease riding due to increase in fare. The net result of this computation would give the company a total annual revenue of $389,752, instead of a revenue of $311,694 for the past year.

The company asked for a rate yielding a total revenue of $400,000 a year. The commission believed, however, that the rate established may reasonably be expected to provide the full amount which the company deems necessary for its continued successful operation.

Weekly Pass Suggested for Use in Fort Smith

By a vote of two to one the City Council of Fort Smith, Ark., has ordered the Fort Smith Light & Traction Company to attend a hearing on rates to be held on May 13. The company's proposal for a three months tryout of the weekly pass plan was disregarded by the commissioners.

At the hearing on rates a return to a 6-cent fare was proposed, but the order was changed to a formal notice to the company to appear in a hearing on rates, when the city attorney told the commission that it could not change the rate without a three days notice and a formal hearing.

D. C. Green, manager of the company, and Judge Joseph M. Hill, its attorney, indicated that the company will contest through the courts any change in its schedule which results in a reduction in revenue.

Mayor Fagan Bourland voted against the motion to bring about a reduction in fare, stating that if the company was making money he would be the first one to vote for a reduction. He called attention to the fact that figures had been presented and sworn to by the company's auditor showing that the company is not making a fair return on its investment.

The hearing was occasioned by a petition for a return to the 5-cent fare.

Manager Green proposed to issue a weekly pass for $1.25.

Steady and continuous reduction in revenue was shown by figures presented by Mr. Green and sworn to by the company's auditor.

Railway Criticised for Not "Selling" Its Rides

Walter Jackson argues for the retention of the 5-cent radial fare and the use of the weekly pass in Bridgeport in three articles written for the Bridgeport *Post* at the solicitation of the editor of that paper and contributed to the issues of April 21, 22 and 24. He considers the present fare plan, with ameliorations here and there, to be excellent for traffic stimulation, but thinks that it lacks the advantages of the pass in this respect and that the Connecticut Company has been lax in advertising the existing service.

Praise for Ed Walker

The Terre Haute *Tribune* said some mighty nice things about the local traction line, in charge of E. M. Walker, in a recent issue. The occasion for this comment was the announcement by the Terre Haute Traction & Light Company of its decision to install the weekly pass. A considerable part of the editorial was devoted to telling about the pass itself and how it would benefit the public. Some of the more complimentary things in the editorial are contained in the following extract:

> While many traction lines are asking for increased rates, the Terre Haute lines, which, by the way, have never advanced the fare over 5 cents, are striking out for more business at the 5-cent fare or less. In other words, the traction company desires a more general use of the cars.
>
> It is interesting to know that the local traction lines are in a position to offer this mutually advantageous proposition. Many such concerns are going the other way, demanding higher rates and resorting to other such extremities to keep out of receivership. It is certain the public here will not only meet the idea half way, but will be appreciative of this unusual manifestation of mutual interest by a public utility.

Injunction Against Jitneys Made Permanent

Kansas City, Mo., ordinances regulating jitneys on the streets of the city have again been upheld by the local courts. On April 17 Judge Nelson E. Johnson of the Circuit Court made permanent a temporary injunction issued by him on Nov. 10, 1921, restraining operators from violating the two jitney ordinances and from conducting business as jitneys on the streets contrary to the provisions of the ordinances. The order is especially significant on the point of violating "by mere subterfuge, shift or device, including, among others, the subterfuge of accepting as a 'gift,' 'gratuity' or otherwise compensation for carrying persons in their cars."

Jitney operators have been running since Nov. 10 without ostensibly charging for their service. The court makes it very clear that the intent is to regulate the "jitney business" and that the operation of jitneys is obviously a business transacted on the public streets. The decision is made against the jitneys on the basis of the right of the city to regulate the use of its streets.

City and Company Argue Abandonment

The City Council of Carlisle, Pa., answered the threat of the Valley Railways, Lemoyne, Pa., to discontinue its service within the city of Carlisle, by telling the company it must do one of two things: discontinue service on all lines in Carlisle and as far east as Boiling Springs, or continue the present service unchanged.

The Council says that the charter of the Cumberland Valley Electric Passenger Railway, which the Valley Railways is operating, calls for service from Boiling Springs to Carlisle and in Carlisle. The charter also states that the company must pay for paving required between the company's tracks. Recent bills of the Council call for paving which would cost the company $11,000. This amount the company said it could not pay, and would withdraw its service to the borough limits. The franchise, however, requires the company to restore the streets to their original condition after tearing up the tracks and poles and taking down the wires. This, according to the Council, would cost the company $44,000.

It would abandon the Cave Hill line, which gives a local service, from the interurban line within the Carlisle city limits, according to its present plans. The interurban operates from Fort Washington to Carlisle.

Fare Injunction Case Being Argued

Application of the Chicago Surface Lines for an injunction against the 6-cent fare order was argued in the United States District Court on April 24 before Judges Evans, Page and Geiger. The hearing was to be concluded later in the week, as the effective date of the order was set originally as May 1.

This is the order entered by the Illinois Commerce Commission on April 8 which proposed to limit the return of the surface lines to 5 per cent and to cut out certain operating expenses so as to make the charging of a 6-cent fare possible.

The companies' attorneys insisted that such a rate would be confiscatory. They also attacked the conclusions of the commission that the lower rate would attract 50,000,000 additional passengers and that no allowance had been made for the expense of this extra burden. Counsel for the city argued that the new rate should be tried and if it resulted in a loss the companies could be compensated.

Mayor Thompson of Chicago has announced that he and members of his cabinet will visit New York City in the near future as guests of Mayor Hylan in the study of local transportation facilities and how they are handled on a 5-cent fare.

300 New Cars Needed, According to Commission Expert

Need for 311 more steel cars on the Brooklyn Rapid Transit Company's subway and elevated lines was expressed on April 24 by Walter T. Edgerton, assistant supervising inspector for the New York Transit Commission at the commission's hearing into the adequacy of the service now being furnished by the company. These are needed, Mr. Edgerton said, in addition to the 900 cars which the company says it will have in service within thirty days, and the total should not include cars that are laid up for repairs but the number that are actually in daily use on the tracks.

Mr. Edgerton also pointed out variances in the service of the Brooklyn Rapid Transit. He said that on some days there might be a fair service in handling the rush hour crowds to Manhattan in the morning, while the service in the evening would be entirely inadequate.

Mayor Hylan also took occasion to step into Brooklyn Rapid Transit matters on April 24 when he wrote to John P. O'Brien, Corporation Counsel, suggesting an investigation into the expenses incurred by the receiver of the company. His suggestion follows the suit instituted a few days ago by Lindley M. Garrison, the receiver, against the city for $30,000,000 damages for failure by the city to carry out its part of the contract under which the rapid transit lines are operated under lease from the city.

More Honors for E. A. Robert

Popular and Efficient Leader of Many Montreal Utility Companies Is Elected President of Quebec Railway, Light, Heat & Power Company

The most talked of man in Montreal these days is E. A. Robert, president of the Montreal Tramways, who was recently elected president of the Quebec Railway, Light, Heat & Power Company. His prominence in the business and financial world comes from the fact that he has developed the Montreal Tramways into an organization unique on this continent. While most public utility companies have during the past ten years found themselves in rather straitened financial circumstances, from a combination of causes, and while in many cities a state of public opinion has grown up which is inimical to the success of such enterprises, Mr. Robert has not only emerged from the war period with his company in splendid financial shape, but public opinion within the sphere of the company's operations is such that residents of Montreal openly boast of the service provided.

When the war broke out the company was face to face with the greatest problem in its history—the problem of obtaining a new franchise. For some years agitators had been at work in Montreal, as in many cities in the United States, trying to stir the public up to blocking the legitimate demands of the company and to favoring the municipalization of the system. But these agitators found two obstacles in their way: First, the inherent distrust of the people of Quebec Province to public ownership, with all its attendant inefficiency and heavy taxation; secondly, the fact that the Montreal Tramways system had, under the Robert régime, been run with such splendid operating efficiency and such regard for the comfort of its patrons that the public felt it would be nothing short of disastrous to take the system out of its hands and turn it over to inexperienced operators.

Before the comprehensive plan could be adopted that had been worked out for keeping the facilities of the company abreast of the growth of the city, it was necessary that the company should be assured as to the terms under which it could operate in the future, and until a new franchise was made this matter would remain in doubt. Therefore only such routes were decided upon for construction as were imperative. The main effort of the company was directed to improving the operating capacity of the existing lines, and this was done by a progressive rearrangement of running schedules and by enlarging the capacity of the cars themselves, but the changes were made only after a comprehensive study had been made by officials of the company of practices in cities elsewhere.

About seven years ago Montreal civic officials were approached regarding the granting of a new franchise to the company. There was some opposition to the granting of a new one until the expiration of the old one in 1922. After considerable controversy, without any result, it was decided to refer the matter to the Quebec Legislature, which body, after being assured of the

E. A. ROBERT

support of both business and labor organizations in Montreal, appointed a special commission to draw up the terms on which to base a new franchise. The commission took the best part of a year to study the whole situation, with the help of the leading authorities on the subject, and after preparing the terms of the contract it was submitted to the Provincial Government. The proposals were adopted, with some minor amendments. The franchise is recognized as a model one in every respect, as it provides ample protection both for the city and the company. This franchise was adopted in 1918 and is working out to the thorough satisfaction of all concerned.

Every year for a long time past experts from all over the country have come to Montreal to inspect the system, and it is the general verdict that for comfort and efficiency the Montreal Tramways is in the first rank. The cars are clean, roomy, airy, splendidly lighted and comfortably heated in cold weather. In winter snowstorms, for which Montreal is noted, they run on schedule just as in summer, for the snowfighting equipment of the company is the last word in efficiency.

While Mr. Robert has made a success of the Montreal Tramways he has not confined his activities to this phase of business life. He first attracted public attention some sixteen years ago, when he undertook to enter the power field in Montreal by developing the water power of the Beauharnois Canal and distributing it in the vicinity of Montreal. His efforts at first were not taken very seriously, as there were powerful corporations occupying the field he proposed to enter. However, he soon demonstrated that he meant business, and from time to time in the face of strenuous opposition he moved from one success to another until to-day he heads a group of power companies that is rapidly becoming a factor not only in the city of Montreal but throughout many portions of the province. With the acquisition recently of the huge Carillon power, some 40 miles from Montreal, from which can be developed 250,000 hp., Mr. Robert becomes an outstanding figure in the hydro-electric power situation in Canada, especially as he proposes immediately to proceed with the consolidation of all the power plants under his presidency and the development of the Carillon plant.

About ten years ago Mr. Robert interested himself with the tramway and power situation in Halifax, N. S., and in 1917 formed the Nova Scotia Tramways & Power Company, Ltd., operating the tramway, light, power and gas services in Halifax and the adjoining city of Dartmouth. He resigned from the presidency of this company in 1919 in order to devote his entire time and attention to the more important tramway and power situation in Montreal and throughout the province of Quebec.

As another evidence of public appreciation of his ability and enterprise, he was during the past month offered the presidency of the Quebec Railway, Light, Heat & Power Company, which operates the street railway, light, power and gas systems in Quebec City and district. The invitation not only came from the executive and shareholders but from the citizens as expressed publicly by the Mayor. Mr. Robert's acceptance of the position means that the same aggressive policy he has displayed in Montreal in railway and power development will be applied to utilities in the city of Quebec.

Mr. Robert was born fifty-seven years ago at Beauharnois, Que., a village about 30 miles from Montreal, and has always been identified with the financial and industrial life of Montreal. He is a member of the leading clubs in Montreal and Quebec and sat for two parliaments in the Provincial Legislature.

Mr. Robert is president of the Montreal Tramways & Power Company, Montreal Tramways Company, Canadian Light & Power Company, Montreal Public Service Corporation, Beauharnois Light, Heat & Power Company, Imperial Trust Company and Quebec Railway, Light & Power Company.

Commission on Interstate Traffic Appointed

Governor Edwards of New Jersey has appointed the members of the State Transit Commission, authorized by an act of the last Legislature introduced by Senator Smith, Passaic, for the purpose of bettering traffic conditions between the counties of Bergen, Essex, Middlesex, Morris, Passaic and Union in New Jersey and New York City. The members appointed are Walter M. Dear, Jersey City; Capt. Harry Hatcher, Hoboken; Herbert S. Swan, Glen Ridge; Spaulding Frazer, Newark; Archibald Cox, Plainfield; Bertran H. Saunders, Paterson, and Daniel A. Garber, Ridgewood.

The bill was introduced as a supplement to the Port Authority plan. It was the opinion that the traffic should be considered in co-operation with that development. The measure provided that the Governor should appoint seven commissioners for the purpose of making an investigation and then report a scheme whereby the conditions of travel in the area affected by the Port Authority would be bettered.

Pacific Electric Makes Changes

The title of T. J. Day, general freight agent of the Pacific Electric Railway, Los Angeles, Cal., has been changed to freight traffic manager, and the title of O. A. Smith, general passenger agent, changed to passenger traffic manager.

T. F. Sullivan Is Boston's Transit Chief

The Transit Department of Boston, Mass., has a new chairman in the person of Thomas F. Sullivan. Mayor Curley, in appointing Mr. Sullivan to succeed Edmund Billings, who resigned, said that he was "obliged to acknowledge merit." That recommendation from a political opponent places Mr. Sullivan ace high, for a prophet is usually not without honor save in the ranks of the opposing party.

Mr. Sullivan has held the responsible position of Commissioner of Public Works until recently. He laid out the first comprehensive plan of rebuilding radial highways from Boston to all outlying suburbs. More than that, he reduced the engineering and inspection forces in the city departments under his charge and established a system of promotion on merit, which eliminated political consideration entirely.

Long service with the Boston Elevated Railway has given Mr. Sullivan a concrete and valuable background for his work as chairman of the transit board. From 1899 to 1918 he was associated with different departments of the railway, serving first as clerk and timekeeper, later as chief clerk and assistant superintendent of tracks. From 1912 until he left the company's service to become Commissioner of Public Works he was roadmaster. He assumed his latest position on April 1.

Louis K. Rourke, formerly Commissioner of Public Works, and Francis E. Slattery, with Mr. Sullivan, make up the personnel of the transit commission.

Mr. Sullivan served in the Santiago campaign during the Spanish-American War and commanded the Tenth Regiment, Massachusetts State Guard, during the European War.

Four Philadelphia Changes

Four appointments have been announced by the Philadelphia Rapid Transit Company, effective April 15. F. W. Johnson becomes assistant to the president. He will continue as editor of "Service Talks." R. T. Senter is appointed assistant to the president on special assignment, E. J. McIlraith superintendent of Rolling Stock and Buildings Department and J. H. M. Andrews superintendent of the Way Department.

K. Y. Abe, chief engineer of the Tokyo Underground Railroad of Japan, is in the United States studying examples of tunnel construction. His company is planning the construction of a 10-mile tunnel under Tokyo's main street. The construction of the Japanese tube will be through sandy soil. Mr. Abe stated that the construction would cost $20,000,000 and would require five years to complete.

H. Flynn, auditor of the Georgia Railway & Power Company, Atlanta, has been appointed assistant comptroller. F. A. Brine has been advanced to the post of auditor. Mr. Flynn has been with the company for more than twenty years. Mr. Brine entered the company in 1901. George S. Jones, Jr., has been made commercial engineer and will have charge of the sale of electric power.

T. C. Berkeley of the English Electric Company is now in the United States and Canada studying rolling stock and fare practices. Mr. Berkeley arrived October last from England and has been engaged since then as specialist for the Toronto Transportation Commission in addition to having charge of the installation of Dick-Kerr electrical equipment on the Toronto system for his firm. He is also engaged in electrical work for the Ontario Hydro-Electric Commission. His headquarters are at 319 Transportation Building, Montreal.

W. J. Baldwin, assistant general manager of the New Orleans Railway & Light Company, has taken up his new work as director of public information for the Alabama Power Company, Birmingham. Mr. Baldwin has had newspaper experience as reporter for various papers in Georgia cities, and for some time owned and published a weekly paper at Hurstboro, Ala. The New Orleans *Daily States* said, upon Mr. Baldwin's departure, that "during Mr. Baldwin's connection with the railway company here, he displayed marked executive ability. His sound judgment contributed largely toward unraveling some of the perplexities which sprang up from time to time in the operation of the properties at New Orleans."

Obituary

William Howard Watson, for many years treasurer of the old Buffalo Street Railway, Buffalo, N. Y., died recently. He was 73 years old. He also had been treasurer of the Bell Telephone Company.

Leslie Richards, superintendent of the Bloomington & Normal Railway & Light Company, Bloomington, Ill., died recently. Mr. Richards was a car operator for eleven years before he became superintendent.

Robert Brisbane, senior construction superintendent for the J. G. White Engineering Corporation, died in New York, N. Y., recently. He was in charge of the construction of the station of the Radio Corporation of America at Bolinas, Cal., which was completed a short time ago. Mr. Brisbane came to America in 1906 from Scotland.

H. F. Beakey, chief of the secret service of the Interborough Rapid Transit Company and New York Railways Company, New York, N. Y., died recently. Mr. Beakey was chief of the secret service of the old Manhattan Railway from 1896 to 1902, later taking charge of the watchmen for some time. Mr. Beakey became chief of the secret service department of the New York Railways when it was formed in 1912 and took over the Metropolitan Street Railroad.

Major Thomas B. Lee, a leader in the field of civil engineering in the South, died at his home in Charlotte, N. C., March 13, 1922. His age was 87 years. Major Lee was in active practice of his profession up to the time of his death, and as a construction engineer had been connected with some of the largest and most important undertakings in the South. He was born at Camden, S. C., and was educated at the Citadel, Charleston. After his graduation he had his first practical experience in railroad construction with the old Blue Ridge Railroad from Anderson, S. C., to Knoxville, Tenn., in 1865. He had charge of the construction of the Seaboard Air Line Railroad from Monroe, N. C., to Atlanta, Ga., which line he subsequently extended to Birmingham, Ala. He concluded the last section of this work in 1905. Shortly after coming to Charlotte in 1905, Major Lee became actively associated with his nephew, W. S. Lee, vice-president and chief engineer of the Southern Power Company. In 1910 he became chief engineer of the Piedmont & Northern Railway and had charge of construction of this road from Charlotte to Gastonia, N. C., and from Spartanburg, S. C., to Greenwood and Anderson in that state. On the completion of this work he resumed his private practice, which he continued until his death.

Digitized by Google

Boulevard from El Cajon Avenue to Mission Cliff gardens; East San Diego line in two sections, first on University Avenue from Park Boulevard to Thirtieth Street and second from Thirtieth to Daley; National Avenue line from Sixteenth Street and Market to the end of the line.

Duluth (Minn.) Street Railway Company has begun the relaying of its tracks on Superior Street. Seven-inch 93-lb. rail will be used with oak ties laid on a broken-stone foundation. Screw spikes with steel tie plates will also be used, and the joints will be welded by the Thermit process.

Muskogee (Okla.) Electric Traction Company will provide transportation to the bathing beach at Honor Heights this spring and summer. Surveyors are at work on plans for running tracks from the end of the West Broadway line to the site of a $500,000 soldiers' memorial hospital, and this line will be extended about two blocks further for patrons of the bathing beach.

Knoxville (Tenn.) Railway & Light Company has agreed to move its tracks to the middle of Central Street between Scott and Morelia Avenues at its own expense. The City Commission in return has agreed to grant a right-of-way franchise similar to the existing one. The question of paving between the rails of the new track will be settled later. The company also agreed to rebuild its tracks on Park Avenue from Gay Street to the viaduct and will pave between the rails of each track and between the double track.

Cincinnati, Ohio.—The Board of Rapid Transit Commissioners, has awarded the contract for constructing section five of the rapid transit loop to the Hickey Brothers, Columbus, Ohio. The Hickey Brothers were awarded the contract, although their bid was $12,823 higher than that of the lowest bidding company, but members of the commission said that their bid was the best. The lowest bid came from the J. T. Adams & Winchell Company, Columbus, Ohio. The Hickey Brothers' bid was $323,680 while the engineer's estimate was $399,635.

Trenton, N. J.—The State Public Utility Commission has denied the application of the City of Trenton, N. J., to compel the New Jersey & Pennsylvania Traction Company to lay additional tracks on West Hanover Street, to relieve congested traffic and alleged consequent danger to the public. The board said that much of the straight track and some of the special work soon must be reconstructed. Then the proper rearrangement can be made. The board said that the existing conditions were not sufficiently dangerous to justify the necessary expenditure for making the proposed change at this time, particularly in view of the financial condition of the company. The city's estimate of the cost was $38,236.40, plus 20 per cent for contractor's profit. The company's estimate was $75,000.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has started on its program of extensions by the replacing of special work at East Water and Michigan Streets. This job consisted of the placing of a new double track crossing with connecting curves on the southwest and northwest corners and is done to permit the rerouting of the Vliet Street cars, which are now operating by way of Third Street, Sycamore, Michigan and East Water Streets to the South Side, returning the same way. In this program of replacements will be the rebuilding of the curves and tracks at Reed and National, at West Water and Grand, and at several other important corners. It is also planned to extend the Center Street line from Sherman Boulevard to Fifty-first street, with a double track. The new work at East Water and Michigan Streets will cost some $35,000; that at Reed and National, about $50,000; that at West Water and Grand some $40,000 and the extension of the Center Street tracks about $40 000 without paving.

Shops and Buildings

Harrisburg Railways Company, Harrisburg, Pa., is installing two new Heine boilers with high furnace combustion chambers and Cox stokers, made by the Combustion Engineering Company.

Columbus, Delaware & Marion Electric Company, Columbus, Ohio., will spend $500,000 in improvements at the new power plant in Scioto, 7 miles south of Marion. The plant originally cost $1,000,000.

New York, N. Y.—Nine bids have been submitted to the Transit Commission in connection with the construction of additional stations and elevators on the Brooklyn-Seventh Avenue subway line, the Fourteenth Street-Eastern line and the miscellaneous work on various rapid transit lines. The highest bidder was George Colon & Company, $235,109. The lowest bid received was submitted by Joseph S. Brown, $207,792.

Wilkes Barre & Hazelton Railway, Hazleton, Pa., has been asked to arrange for the work necessary on switches and sidings from its line to connect with a new million dollar substation at Ashley Plains which will be put up by the Pennsylvania Power & Light Company. This substation will step down the high-tension current delivered by the Harwood power house to Wilkes-Barre. Work on the high-tension line has already been started.

Municipal Railway of St. Petersburg, Fla., will be driven by municipal current if the recommendations of a committee appointed by the City Commission are carried out. The committee has returned from a tour of Florida's municipally-owned power plants and has gone into the St. Petersburg situation with prospects for added demands due to the growth of the street railway. It advises the building of a 1,500 kilowatt plant immediately to furnish power for the municipal enterprises—street car line, gas plant, waterworks and street lighting—upon expiration next January of the present contract with the St. Petersburg Lighting Company. With this view in mind an electrical engineer has been called in to go into the situation and report to the commission, which is willing to call an election for bonds up to $300,000 for such plant. C. T. Baker is the consulting engineer who has been secured.

Oregon Electric Railway, Portland, Ore., has placed an order for automatic substation equipment, said to be the largest single order for automatic equipment of this kind ever placed in this country. Seven stations at present manually operated will be equipped with synchronous converters. These stations, which have been in operation since 1912, range in capacity from 500 to 1,000 kw., and generate power for the 180 miles of interurban system of the company at 1,200 volts, direct current. The automatic equipment will include separate exciters for the synchronous converters to insure correct polarity at starting and will be designed along standard lines for present railway practice. The equipment at each station will consist essentially of a motor-driven drum controller, exciter, contactors, switches and relays with protective devices and load-limiting resistors. The stations will be cut in on the line or shut down according to the demand for power, which will vary with the number of cars operating on the line.

Trade Notes

Johnson Fare Boxes.—The Chicago Surface Lines has arranged with the Johnson Fare Box Company for a trial installation of fifteen electrically driven fare boxes. These are of a new design providing instantaneous registration.

The Ohio Brass Company, Mansfield, Ohio, states that its cars will be used O. A. Lawrie as district sales manager in the New England territory with headquarters in Boston. For the past sixteen years Mr. Lawrie has been with the American Copper Products Company.

The Westinghouse Electric & Manufacturing Company has received an order for 50,000 suspension insulators from the Southern California Edison Company, Los Angeles, Cal. The insulators will be used in the reinsulation of 275 miles of high-tension line, to increase from 150,000 to 220,000 volts.

Differential Car Company, Findlay, Ohio, states that its cars will be used in Cleveland and Toronto this summer for hauling wet concrete from a central mixing station. Experiments made in Cleveland last fall indicate that the character of the concrete is not changed in transporting even with a maximum elapsed time between the mixer and ground of eighty-three minutes.

Western Electric Company, New York, N. Y., announces the appointment of Edward B. Craft as chief engineer. This appointment is the result of a reorganization of the administrative department by which the operating functions are divided among four major departments. Dr. F. B. Jewett, vice-president of the company, has charge of the telephone department; vice-president H. A. Halligan has charge of the purchasing, traffic, legal, accounting, treasury and publicity personnel; F. A. Ketcham, general sales manager, takes charge of the supply department, and G. E. Pingree, vice-president and general manager of the International Western Electric Company, has the foreign department.

Wagner Electric Manufacturing Company, St. Louis, Mo., is advertising the Pow-R-Full Motor, which provides a pull box as a part of the motor frame into which the leads of the motor extend. The box may be turned in four directions for conduit connections. The advertisements of the motor accentuate the fact that vibration has been very largely eliminated and that the motor runs quietly.

Dutchess Bleachery, Inc., Wappingers Falls, N. Y., announces that its insulation division has taken over the sales of its products which were formerly sold through American Di-Electrics, Ltd. The new coating plant at Wappingers Falls has a present capacity of 2,000,000 yd. per year, which includes varnished fabrics of all standard gages and widths. Additional equipment is in the course of construction.

Westinghouse Electric & Manufacturing Company has separated the divisions of power and railway at the Pittsburgh office, and some new appointments have been made. Barton Stevenson, who previously was manager of both divisions, will continue as manager of the power division. F. G. Hickling has been appointed manager of the railway division, and S. R. Shave will act as manager of the price section for both divisions.

Combustion Engineering Corporation, New York, N. Y., has recently completed arrangements with the Power Plant Equipment Company, Kansas City, Mo., whereby that company will represent the corporation in that territory which covers, in a general way, eastern Kansas, eastern Nebraska, western Arkansas, and western Missouri. This district was taken over by the Power Plant Equipment Company on March 1, 1922. The Kansas City address of the Combustion Engineering Corporation is 1002 Coco-Cola Building.

Ford, Bacon & Davis, New York, N. Y., a firm of specialists in engineering and management of public utility and industrial business, outlines the facilities at hand and scope of service it is prepared to render in a booklet just issued. The company handles investigations, reports and valuations, organization, financing and development, engineering designing and planning, construction, accounting and management. Another booklet describes the United States Army supply base at New Orleans, La., which the company is constructing.

Roller-Smith Company, New York, N. Y., announces the following changes in its sales organization: The Perkins-LeNoir Company, which formerly represented the Roller-Smith Company in Philadelphia, has been succeeded by Esherick & Hoyle, Otis Building, who will handle the company's line of electrical instruments, meters and circuit breakers in the Philadelphia territory. The Perkins-LeNoir Company, which formerly represented the Roller-Smith Company in Baltimore, has been succeeded by J. E. Perkins, 113 E. Franklin Street, who will handle the company's line of electrical instruments, meters and circuit breakers in the Baltimore territory.

Railway Audit & Inspection Company, Philadelphia, Pa., has announced the following officers for this year: E. C. Hathaway, chairman of the board; H. N. Brown, president; T. C. Cary, first vice-president and general manager; C. H. G. Larrimore, assistant general manager; C. E. Horney, second vice-president and treasurer; George W. Reif, secretary. The field covered by the company was divided as follows: K. H. Wendling, managing central division; I. F. Heidler, supervisor central division, Frick Building, Pittsburgh, Pa.; W. B. Edwards, assistant manager central division, Perry-Payne Building, Cleveland, Ohio; P. H. Diehl, manager western division, Webster Building, Chicago, Ill.; F. W. Stockmar, assistant manager western division, Railway Exchange Building, St. Louis, Mo.; Harry Preston, manager southern division, Candler Building, Atlanta, Ga.; J. P. Graham, district manager, Drovers & Mechanics National Bank Building, Baltimore, Md.; J. H. Cain, district manager, Little Building, Boston, Mass.; C. E. Harbison, district manager, Candler Building, New York City, N. Y.; L. D. Rice, district supervisor, Brown Brothers Building, Philadelphia, Pa.

New Advertising Literature

Schutte & Koerting Company, Philadelphia, Pa., has issued a flyer showing the straightway valve being marketed by that company.

Westinghouse Union Battery Company, Swissvale, Pa., has issued Bulletin No. 1102 descriptive of its radio batteries and Bulletin No. 1201-A descriptive of its storage batteries for farm lighting.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has published a folder on Shurvent fuses. The folder explains the application and design of fuses for the protection of low-voltage circuits up to 600 volts for both alternating and direct current.

Heine Boiler Company, St. Louis, Mo., is distributing a reprint of a message from C. R. D. Meier, president of the company, to Heine boiler salesmen. This contains a discussion on present business conditions and includes diagrammatic curves of wholesale prices in the United States for 110 years.

Electric Railway Equipment Company, Cincinnati, Ohio, has issued a folder giving construction details and installations of Elreco combination railway and lighting poles, and ornamental brackets. A list of cities which have these in use is given, together with illustrations of the completed installations.

Heine Boiler Company, St. Louis, Mo., has issued a folder entitled "Forty Years of Progress." This contains information on several new developments in boiler design and announces a change in the name of the company which was previously Heine Safety Boiler Company. The change consists in dropping the word "Safety."

Ingersoll-Rand Company New York, N. Y., has issued bulletin describing the Price type "PO" horizontal single cylinder oil engine. One of the outstanding features of these engines is the shape of the combustion chamber and the arrangement and construction of the spray nozzle used for direct-injection of fuel.

The Page Steel & Wire Company has just issued a new handbook giving information on Page-Armco welding rods and electrodes. This gives information on the various products manufactured, the sizes, weights, etc., together with specifications for welding rods and electrodes as issued by the American Welding Society, and tests for welding electrodes.

Uehling Instrument Company, Paterson, N. J., has recently issued Bulletin 112, covering Uehling CO_2 recording equipment, for guiding the engineer and fireman in reducing the waste of fuel up the chimney. Features are the separate recorder for the engineer's office and indicator for the boiler front, continuous chart record and dry method of absorption.

Atlas Valve Company, Newark, N. J., is distributing a small booklet giving information on reducing-valve economy. Information is given on the flow of steam through pipes, together with handy tables for determining the size of pipe needed. Information is also given on superheated steam, extra heavy pipe, pipe fittings, leaders to heating systems, pipe friction allowances, and steam velocities.

Westinghouse Electric & Manufacturing Company has just published some electrification data in Vol. III, No. 2, of its *Data* publications. This points out the value of electrification of railroads as a means of conserving energy and contains information regarding desired standards for railroad electrification and discussion as to the future of railroading and existing electrifications.

To Eliminate Waste in National Electrical Associations

ONE of the important lines of research undertaken by engineering associations within recent years has been the study of methods for eliminating waste in industry, conducted by the Federated American Engineering Societies last year. The task was one peculiarly suited to an organization representing the leading engineering societies because engineers are trained by long experience in the collection and study of statistics to secure economy of output in the undertakings in their charge.

The consideration of methods to reduce waste by the Federated American Engineering Societies is mentioned in these columns again because of the very similar plan now being initiated by the Society for Electrical Development to eliminate waste or duplication in the activities of the various national electrical associations. Such an effort is a very desirable one. Americans are often spoken of by European observers as a nation of "joiners." There are in this country innumerable national and sectional organizations of people engaged in the same trade or profession; of people with the same interests in educational, literary, religious and social life; of people living in one city who have been born or reared in some other part of the country, people whose ancestors fought in the same early war, people with the same surnames, people with the same physical or corporeal attributes, such as fat men's clubs and bald men's clubs.

Associations and societies in engineering and its allied lines of business have grown up in somewhat the same way. Perhaps two or three men who believed that mutual benefit would be obtained by the association of themselves and others with the same idea or ideals have formed an association. With these heterogeneous beginnings, there is no doubt that without co-ordination of purpose there must be considerable overlapping, and there are probably instances of lack of efficiency even where actual overlapping does not exist. As each society has been largely a law unto itself, feeling no responsibility except to its own members, it is almost inevitable that such a condition of affairs should exist. If so, it is logical that the national engineering societies, and especially the electrical societies, should take the lead in effecting a reform.

While each society or association has its own purposes, there is a common purpose to all, namely, to advance the interests of its members in the most economical way, by legitimate means, so that any steps toward the elimination of waste in the work of these associations should be welcomed. Another and added reason is that in a sense each organization is acting in a trust relation to its members. The acceptance from them of dues is equivalent to an agreement by the society that these dues will be spent in the way most efficiently to carry out the purposes of the organization and for no other purpose. Here is an additional reason for such a co-operative study.

The representatives for this undertaking appointed by the executive committee of the Society for Electrical Development are men of extended experience in electrical as well as in association work, and good results may be expected from their mission if the other national electrical associations accept the invitation to participate. They should do so.

180 Reasons for Being Cheerful

ONLY one conclusion can be drawn from the figures of operation of 180 electric railways compiled by the American Electric Railway Association for 1921. It is that the processes are being accelerated by which the electric railways are coming back. The improvement as shown by the figures is more pronounced for the city lines than for the interurbans, but this is quite natural, for the interurbans have been beset lately by certain conditions that do not apply to the purely urban system. This condition is gradually righting itself and will be speedily corrected as the interurbans recover the business that has been lost to them through the curtailment of freight and express shipments.

The most promising sign of the times as reflected in the figures is the reduction in the operating ratio. This is not very pronounced, but it indicates the start that has been made both in the deflation of labor and of the cost of material and supplies. Another promising factor is the gradual lessening of the interest rate for money. Within the last few years only such financing has been done as was imperative, but the time now is ahead when work previously put off may be carried out with money secured at reasonable rates. This will permit betterments to be made that will make possible the handling of present and future business to greater advantage and at relatively smaller costs.

There are many problems ahead to be solved, but the period since the war has shaken the industry out of its lethargy and taught it lessons in economy which will be of the greatest help in the future. To some executives it may seem that the enforced pruning processes were emergency measures of the hour, from some of which they will be glad to be free in the future. There is no doubt that recourse had to be made to a few measures that were distasteful and of a temporary nature, but there are others that have left an imprint that will be handed down in the future to the lasting benefit of the industry.

The natural and easy thing is to be profligate. Stern necessity is, however, a good teacher. The salutary effect of the period through which the industry appears now to have passed will probably remain for all time. When all the onerous conditions are considered which were imposed on the industry during the war-time

Digitized by Google

period it is to be wondered that the electric railways have come through as well as they did. That the record of the past few years was not worse is, indeed, a striking tribute to the industry and resourcefulness of operating officials everywhere.

Study of Car Ventilation Is Much Needed

PERPLEXING indeed is the problem confronting the railway engineer if he starts out in earnest to determine what is a thoroughly satisfactory system of car ventilation. Perhaps there isn't such a thing. But certainly there is a great diversity of opinion on the subject, and this opinion is often based on elaborate tests—at least they seemed so at the time made. The editors of this paper tried last fall to agree on an editorial on what constitutes good ventilation and on its relation to car roof design, but were unable to harmonize their views and experience. At the convention they noted the similar divergence of opinion as expressed by various railway engineers. Since that time, at least one very able car design engineer, who had previously convinced himself of some definite ideas on the subject, has studied and investigated extensively, with the result that he has acquired a very substantial doubt about his former beliefs without being able to reach a more satisfactory view as to a real solution of the question.

At present there seems to be a general floundering on this subject. Nor is the absence of definite knowledge on ventilation confined to the electric railway field. One important steam road has changed back from an arch roof design to its older monitor-deck construction on account of ventilation, but more recently decided again on the arch roof for equipment to be purchased in the near future. One of the largest builders of steam road passenger cars admits it has not been able to find a wholly satisfactory ventilating system, though its construction is confined almost entirely to the monitor-deck type roof with which some consider it easier to ventilate.

Perhaps it actually is an impossibility to meet all the ramifications of conditions in attempting to provide a system that will be free from complaints. One person must feel cool, fresh air in his nostrils or the car is stuffy, while another will complain of drafts under this condition. Ventilators must take in or exhaust enough air at low speed and not too much at high speed. They must function in rarefied air or in heavy damp air. A passenger or two must have the window open and the ventilators must provide the right amount of air whether these windows are open or all closed tight. Then there is the uncertainty, with some types of ventilators, resulting from failure of the trainmen to make the right adjustment of shutters.

In high-speed interurban service with modern steel cars well equipped with weather strips and double windows, and the body tight everywhere to eliminate all drafts and obtain good heating, one of the common faults is that the exhaust ventilators cannot function because not enough air is admitted to the car interior. The installation of sufficient intake ventilators so that the exhaust ventilators will have something to draw out without trying to reduce the interior air pressure below atmospheric seems to introduce objectionable drafts. The principal problem among many, in this particular case, is therefore perhaps the introduction of adequate air without the passengers knowing it. An additional one is that of heating this air input in winter.

These things point to the great desirability of extensive study and experimentation on ventilation methods and devices, their design and location in a car, and the relation of roof design to the ventilation problem. This is particularly needed in connection with interurban equipment. About eight years ago many manufacturers were active in developing ventilating methods and equipment, but there has been a notable absence of further development work on their part since the war. Surely this is a subject which demands prompt and comprehensive treatment, for the tendency to change from arch roof to monitor deck, or vice versa, with changing personal conviction, is something to be avoided. If for no other reason, trains made up of cars with these two kinds of roof look badly, and flexibility of operation is limited if an attempt is made to keep cars of the same type together. Perhaps the way to start a study of this problem is to come to an agreement on what is the proper amount of air per passenger per hour to introduce into and exhaust from a car. With this determined, the next step would be to decide on the most effective and satisfactory means of accomplishing this end under average conditions. The extreme conditions, it would seem, will have to be taken care of by some special arrangement.

New Orleans Compromise Agreement a Wise Move

MAYOR McSHANE of New Orleans appears to be the only outstanding figure interposing any objection to the plan for the reorganization of the New Orleans Railway & Light Company under the agreement just approved by the Council of that city. The settlement is a compromise. City Commissioner Maloney, who has taken a prominent part in the negotiations leading up to the settlement, saw this as the only way out. The courts had sustained the rights of the city to the rate-making power, but Mr. Maloney and the four other members of the commission realized that in the last analysis a rate cannot prevail that is confiscatory and that any attempt by the city to impose unduly burdensome rates could only result in prolonging litigation. In the event of resort to the courts, Mr. Maloney felt none too certain that the city would not lose concessions which it has now secured under the proposed new amicable arrangement. That, in short, has been the basis on which he has waged his campaign for the acceptance of the new terms. As for the company, it has agreed to a rate base value of $44,700,000 plus additions subsequent to December, 1920, as against $71,000,000 of outstanding capital liabilities, and a value of $56,000,000 fixed by the company's engineers as reproduction cost on the basis of average prices over a five-year period. The railway department starts with a 7-cent fare, this rate to continue for one year.

It seems to be pretty generally agreed that the interests of both the city and the company are protected for the future, with the city standing to gain very largely through the money that will be put back into the property for improvements and betterments. It is quite unlikely that the city would have done nearly so well had it insisted upon fighting the issues out through the courts. Even authorities with no immediate interest in the terms of the settlement agreed with Mr. Maloney and his fellow commissioners that this was so.

LOOKING NORTH ON PEACHTREE STREET TO FIVE POINTS, ONE OF THE MOST CONGESTED CORNERS IN ATLANTA

Transportation Developments in Atlanta

The Combination of Narrow Streets, High Buildings and Many Automobiles Has Made Necessary Up-to-Date Methods of Reducing Street Congestion—Extended Consideration Has Also Been Given to the Engagement and Training of Employees and the Promotion of Traffic

ATLANTA is the second largest city in the Southern States, ranking next to New Orleans in population, and is often referred to as the "gateway" of the South, because of its importance as a railroad center. Its population in 1920, according to the United States census, was 200,616, as compared with 154,839 in 1910 and 89,872 in 1900. This is an increase of about 30 per cent in the last ten years and 123 per cent in the last twenty years.

The transportation problems in the city have always been complicated because of the narrowness of the principal streets, and the situation has naturally become more acute in recent years because of the great increases of population and the construction downtown of many tall buildings. The city has now a city planning commission, to which Robert H. Whitten of Cleveland and New York has made a report recommending zoning and the construction of certain boulevards and viaducts. These improvements may help the transportation situation, particularly in the newer parts of the city. At present the downtown streets are very congested and hardly able to carry the volume of traffic which passes through them and there is crying need for some relief. Peachtree Street, the principal business thoroughfare of the city, is only about 35 ft. wide between curbs in the downtown section, and with two lines of electric cars there is room for only a single line of automobiles on each side.

The city has done much to relieve this situation by the passage of ordinances which prohibit the parking of automobiles on the most congested streets where there are car tracks between 7:00 and 9:30 a.m. and between 4:30 and 7 p.m., and prohibiting parking on these streets for more than thirty minutes at other hours. The city has also traffic officers at the principal downtown corners and has recently installed a system of electric traffic signals with colored lights, to be operated by the traffic officer at the most congested point downtown, known as Five Points.

COMPANY HELPS REDUCE CONGESTION

The principal steps taken by the company to relieve the situation consist of the employment of a corps of traffic supervisors and inspectors in the congested area, the establishment of safety zones to facilitate rapid boarding, the limitation of the number and time of car stops in the most congested districts and the rigorous maintenance of time schedules.

The traffic supervisors consist of a selected body of about thirty men whose duties are to keep the traffic moving and to see that car schedules are maintained. Some of these supervisors have definite stations and others travel about the system. These supervisors are uniformed and have police powers so that they may make arrests, and they wear the police badge. During rainy weather those at fixed points wear white weatherproof caps and coats and white rubber boots so that as they stand on the corners or in the streets they will be conspicuous to the drivers and pedestrians.

As yet the company has not installed any loading platforms, but it has provided a substitute therefor by railing off safety zones by movable posts and ropes at the principal downtown loading points. The number of these points has been reduced to a minimum. Each stop, whether in the congested area or outside, is designated by a stop sign reading "Cars stop here" in white

(The original diagram shows the number of cars on all lines. Only a few of these have been reproduced.)

letters on a blue background. It is carried either on the side pole or on the span wire itself. Rapidity of operation at the most used stopping points downtown is secured by a supervisor and a front-end collector who admits passengers into the front end of the car. About twelve loading points are covered in this way, some all day and some during the morning and evening rush hours only.

MAINTENANCE OF CAR SCHEDULES

An important duty of these men, in addition to directing traffic, is to see that there is a careful maintenance of time schedules by the car crews. The schedules are drafted by the transportation engineer, as will be described later. Each run is given what is called a "block number," and the schedule for each car with the time at which it should start from each terminal and pass various time points en route is typewritten and carried under transparent celluloid in a metal frame in the front cab where it is constantly within the vision of the motorman. The motorman and conductor carry standardized watches which are regulated free of charge by the company.

When a motorman starts out from the carhouse at the beginning of his run he procures from the starter a metal holder containing the timetable for that particular run and places it in the cab. He also gets from a rack at the carhouse two small plates showing the block number of his particular run and attaches one on the outside of the front cab and one on the outside of the rear cab.

The supervisors check the time of cars at a great many of the time points, in the following way:

Each supervisor has a small handbook with pages ruled as shown in the reproduction on page 744. Each double page covers a period of one hour with each horizontal line reserved for one minute. The left half of each single page is used for cars running in the inbound direction, and the right half of each single page is used for cars running in the outbound direction. A vertical column on each half of the page is reserved for each route running past the particular time point. All routes are numbered.

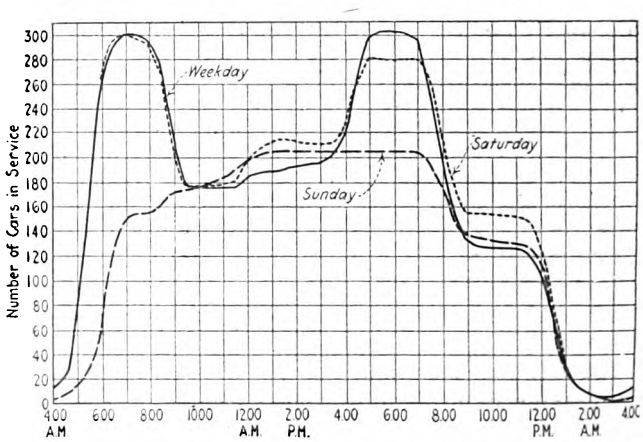
The book is then filled out so as to give, for the schedules in force, the time at which each car according to block number on each route should pass that point. It is necessary only for the supervisor mentally to check off the cars as they pass the intersection or time point, on time, as no writing is done on this handbook. If a motorman is late, he is warned either informally or officially, and reports regarding deviation from schedule are made up on special forms provided for this purpose.

At the terminals which inspectors can hardly be spared to watch the company is using a Nachod headway recorder to check in and out cars. It is very easy to determine with this recorder the time of arrival and departure of any particular car or crew. As yet only the principal terminals have been equipped with this recorder.

The company has its own telephone system connecting the terminals, carhouses and important traffic points with each other through a central in the main office, and all cars are dispatched by telephone. In case of blockade the nearest inspector has authority to turn back cars, reporting such action promptly to the chief dispatcher so that the latter may send out additional cars to maintain the proper headway.

Accompanying diagrams show the number of cars scheduled by thirty-minute periods through the day and the car flow diagram through the business section of Atlanta during the maximum afternoon rush hour of Jan. 16, 1922, the figures in circles showing the number of cars. Another chart shows a graphical method devised by the transportation engineer of the company to check traffic schedules graphically and if possible to trace the trouble to particular motormen.

This chart, of which a section only is reproduced, shows both the scheduled time and the actual time of cars on each of three days past the point of observation, which was the corner of Peachtree Street and Ponce de Leon Avenue. The scheduled time of cars is indicated by the upper vertical line in each case and the actual time by the lower vertical line of half the length of

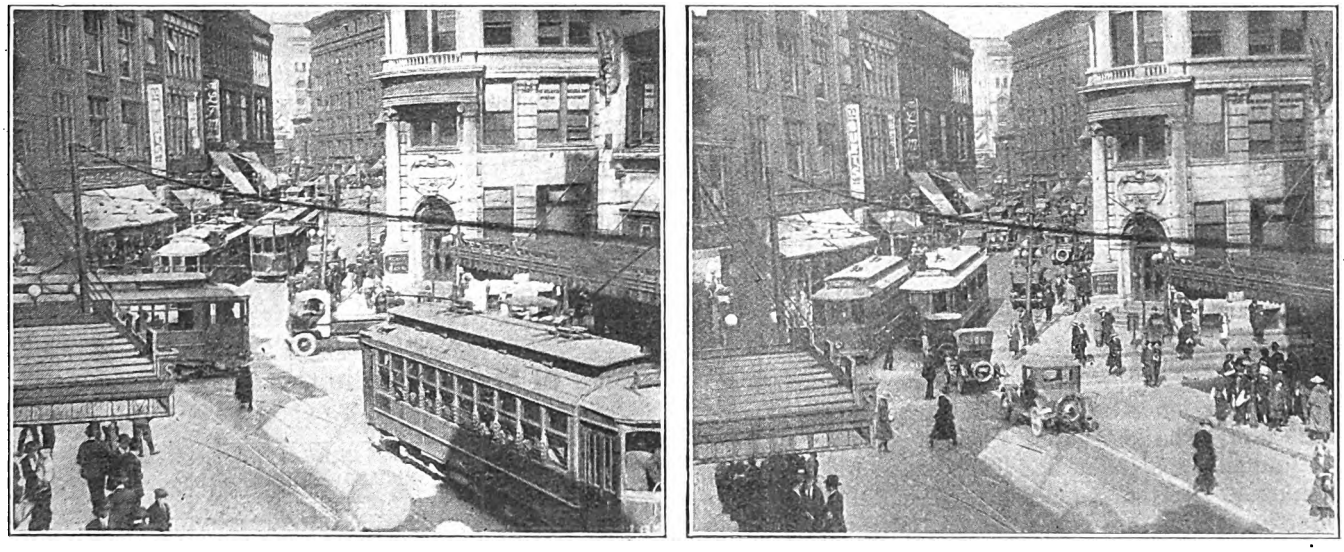


NUMBER OF CARS SCHEDULED FOR OPERATION, DECEMBER, 1921, BY THIRTY-MINUTE PERIODS THROUGHOUT THE DAY

Digitized by Google

the upper line. Whenever a car is behind time, a dotted line connecting the scheduled time with the actual time and running at an angle inclines downward to the right. If the car is ahead of time, the line inclines downward to the left. Where there is no deviation from schedule, the dotted line is usually omitted.

This chart is not intended as a traffic study but purely as a time study of maintenance of schedule, and it has been found to be especially useful for detecting recurring deviations from schedules by the same block number or by cars operated by the same crew. Thus, in the chart shown, Block No. 5 will be found late on each of the three days charted, and in one case the crew apparently came back so late that the supervisor had to turn the car in the center of the city and put it on time again. A case of a car running ahead of time and disrupting schedule is that of Block No. 22 on each of the three days. This car is a tripper and runs only during rush hours. At 7:28 a.m. this car is due out-bound to follow Block No. 4, but the chart shows that it cut out Block No. 4 on each of the three days charted.



VIEW OF ALABAMA AND WHITEHALL STREETS INTERSECTION—LOOKING NORTH ON WHITEHALL STREET, SHOWING TALL BUILDINGS AND NARROW STREETS

For convenience in operation the railway system of the Georgia Railway & Power Company has been divided into three sections or divisions. A superintendent in charge of each division handles all matters of discipline relating to the men operating out of the carhouse in that division, but while the trainmen are operating cars they are under the supervision and direction of the superintendent of the division in which the car may be at the time.

ENGAGING EMPLOYEES

The employment office of the company is at the main transportation headquarters on Piedmont Avenue. Prospective employees are first interviewed by the superintendent of employment and if their appearance, bearing, etc., are satisfactory they are asked a few simple questions, along the lines of the mentality test used by the United States army during the late war. Each candidate is then asked to perform a few simple acts to denote his degree of alertness and is examined on colors, and if he passes these and a few other simple tests he receives an application blank to fill out.

This blank calls for the usual identification data in regard to himself, number of dependents, names and addresses of nearest relatives, whether employed previously by a utility, physical condition and state of health, whether having a trade or profession, if intoxicating liquors are used, if ever discharged from any position, if any relatives are employed by the company, if he has a financial interest in any business, if any claim for personal injury has ever been brought by him, if he has ever been required to give a surety bond, a record of his employment during the past five years, three references, not former employers, and if he has ever been convicted of a crime or misdemeanor. He is also required to sign at least six copies of an inquiry blank releasing the references from any liabilities for information given in regard to him. The application blank also contains the text of an agreement by the applicant expressing himself as willing to work ninety days on probation and allows the company to dispense with his services at any time during this probation period for general unfitness or without specific charge.

The next step is the physical examination. While this examination is not as extended as that which would be given by a life insurance company in so far as the latter might go back into the history of the applicant's family, it is very thorough and is based on the experience of the present medical examiner, who has spent many years in examining applicants for trainmen's positions. Besides the usual heart, lung and blood tests, and urinalysis, the test includes one of alertness of mind. This is considered helpful in determining the ability of the man to avoid accidents.

If these tests are passed successfully, a photograph is taken of the full face only. The profile is not considered worth the additional expense.

INSTRUCTION IS THOROUGH

Instruction is then given to the applicant in the instruction room on operating and safety rules, his duties in meeting the public, and his responsibility for creating favorable public opinion through his actions, general bearing, etc. This first instruction does not contemplate a detailed analysis and study of the rules, but it is believed that by a preliminary talk of this kind, when a man's mind is fresh and unburdened by the detailed instruction in store for him, the principles of the work will be more carefully remembered later.

Digitized by Google

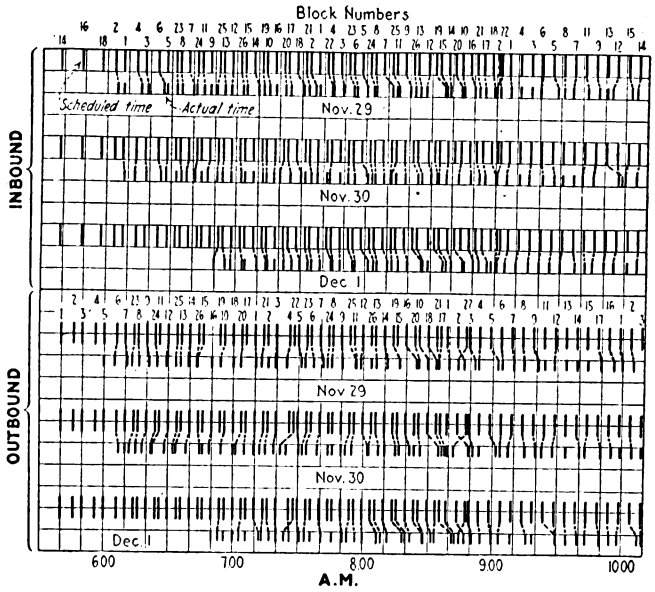


CHART SHOWING ACTUAL TIME OF CARS, CHECKED AGAINST SCHEDULED TIME, PEACHTREE LINE

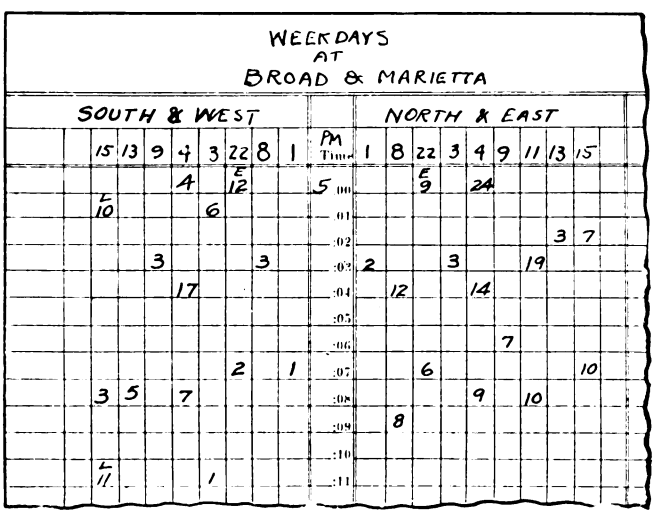
The superintendent of employment and instruction then introduces the applicant personally to his training assistant and there is an effort to make him feel that these instructors are not drivers or grillers but are there to help and encourage him and to make him if possible the star man on his division. It is believed that here encouragement is especially necessary. The man also receives then his instruction book and badge.

A day is spent in the instruction room. It is thought that this is all that is necessary, since the applicant will be in and out of the instruction room frequently and may go over again any operation which may arise to puzzle him. The instruction room is equipped with the usual dummy controller stand and brake stand, with an illuminated chart of connections which shows the circuits through motors and resistance at different points of the controller, a typical air brake equipment, etc., for the motorman, and a register, blanks, etc., for the conductor. The candidate is then sent out on the road under the guidance of an instructor.

As already explained, the Atlanta system is divided into three divisions, each with a separate carhouse rather widely separated. The applicant is sent to one of these carhouses with a letter of introduction to the



UPPER PART OF PAGE USED BY TRAFFIC SUPERVISOR TO CHECK ACTUAL TIME AGAINST SCHEDULED TIME AT VARIOUS TRAFFIC POINTS

man with whom he will train. These instructors, who are selected motormen and conductors, receive 5 cents per hour extra for giving instructions. The applicant averages about two days on each route of the division on which he is working, being required to work on both the day shift and the night shift. It usually takes from fourteen to fifteen days from the time the applicant has his physical examination until he has completed his course of breaking in.

He then returns to the superintendent of instruction and employment for a written examination. The questions then given cover not only a general knowledge of car operation but have to do with such local knowledge of the lines as is essential to a proper conduct of the work. These questions, with the proper answers, are printed in pamphlet form, and a copy is given to the applicant beforehand. He is expected to memorize the answers so that when the questions only are submitted to him he can readily give the proper replies. In addition to this written examination, applicants are cross-examined on the rules, and a final talk is given to them on personal conduct, safety matters, accident prevention, etc. The man is then personally introduced to his division superintendent, who in turn introduces him to the division starter, to whom he reports each day for

Plan of Service Annuities Announced For Employees of G. R. & P. Company

New Plan Becomes Effective From and After January 1, 1922

FOR the purpose of providing financial assistance for employees of the Company who, because of age or disability, are unable to continue in active work, and

READ PLAN IN FULL, MR. ARKWRIGHT URGES

THE ACCOMPANYING plan has been authorized by the Board of Directors, and makes provision for all employees of the company who may, because of age or disability, become unable to continue in active work, and whose long service justifies assistance from the company.

Provision Made for Age and Disability—Plan Announced in Full

UPPER PART OF EXTRA ISSUE OF "SNAPSHOTS" CARRYING ANNOUNCEMENT OF ESTABLISHMENT OF SERVICE ANNUITIES

duty. He is then put to work and is on probation for a period of ninety days from the day he was accepted for training unless released in the meantime.

At the end of his ninety days probationary period he is brought in for oral examination on rules, operating conditions, etc. This examination is very thorough and is intended not only to test the men but to smooth out any rough spots which may be confusing to them.

Up to this stage the man is considered, and is in fact, an "applicant," even if he may have been on the payroll of the company for some sixty days. His probationary period, however, is ended, and it is necessary for the company to accept him or reject him. If accepted he is assigned to a certain standing according to his proper seniority with regard to the other applicants and is then a full-fledged employee. If unsuitable, he is allowed to go, which the company is privileged to do with or without specific charge.

The wages paid all trainmen engaged by the company after Jan. 1, 1922, are 40 cents for the first year, 45 cents for the second year and 48 cents for the third year and thereafter. The maximum quoted is the same for all, but some employees engaged before Jan. 1, 1922, did not start in at the lower rate. Runs are made as

Two Bells

Atlanta, Ga. Feb. 14, 1922 — Published each week for Everybody by The Georgia Railway & Power Co. — Volume IV Number VI

Everybody Has A Reason all His Own!

PARDON us if we lapse into Sanskrit—but don't some of the blamedest things happen sometimes? Anybody will agree with that, so stay put while we turn this into a personal narrative.

All pepped up by the recent account of how Doc Roberts is saving money by storing his automobile and riding the street car, the editor of TWO BELLS beat himself to write a few of the one thousand and nineteen reasons why everybody should ride the street cars.

THERE WERE plenty of 'em!

The street car bed it over the automobile forty ways from Sunday from the utilitarian standpoint. Safer, cheaper, more dependable.

WE MUST DESERVE PUBLIC'S GOOD WILL

Page Two — TWO BELLS — February, 27, 1922

This Doesn't Mean NOT to Say "Good Morning"

To Auto Owners

Street car service is always on tap for your benefit.

Use your auto to go where the street car doesn't reach.

You can reduce the maintenance on your car considerably and increase the size of your pocketbook if you will let the motorman be your chauffeur for a while.

The auto for pleasure and the street car for business will hasten return to prosperity.

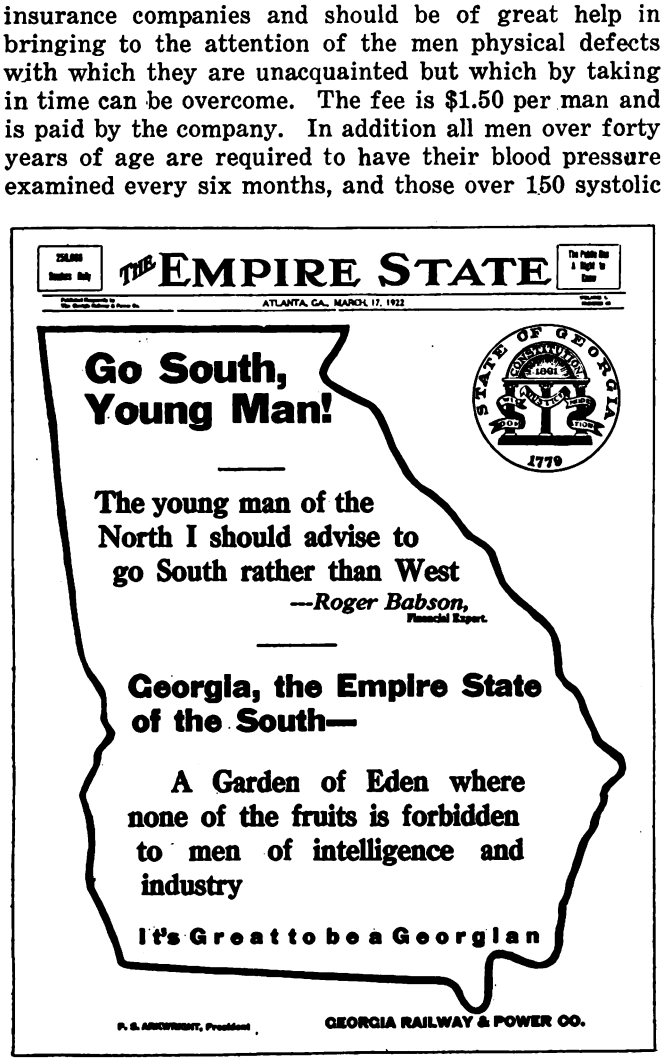
BALLAD OF THE BELL-(E)S

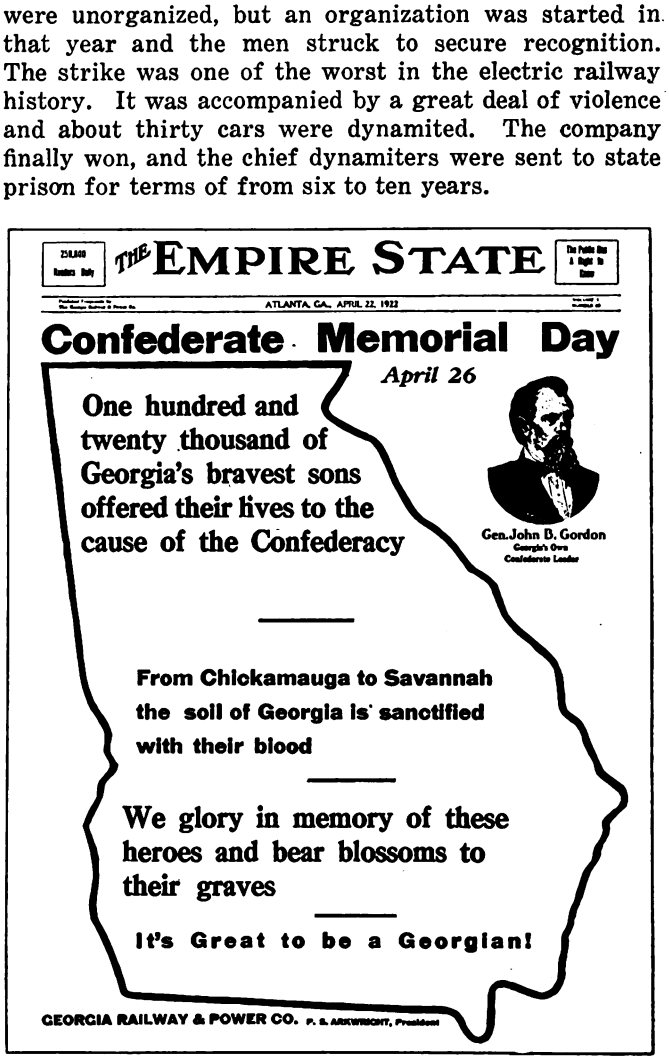
"IT'S GREAT TO BE A GEORGIAN!"

TRY IT, ANYWAY

If Flare-Ups Come

THEY CAN'T; YOU CAN!





TYPICAL WINDOW POSTERS CARRIED IN CARS TO ADVERTISE THE CITY OF ATLANTA AND THE STATE OF GEORGIA

near nine hours as possible. The extra list is rotated, and the upper 50 per cent of the men on the extra list are guaranteed five hours time. There is an effort, of course, to keep the extra list as small as possible.

RE-EXAMINATION OF EMPLOYEES IS SYSTEMATICALLY CARRIED OUT

The company makes an annual physical examination of all division superintendents, supervisors, motormen and conductors. Motormen and conductors are re-examined on the rules at least every five years. Those who fail to pass are required to undergo the training or instruction necessary to give them the knowledge required. The plan of a physical re-examination has just been adopted. It is based on the lines of examinations made by life insurance companies and should be of great help in bringing to the attention of the men physical defects with which they are unacquainted but which by taking in time can be overcome. The fee is $1.50 per man and is paid by the company. In addition all men over forty years of age are required to have their blood pressure examined every six months, and those over 150 systolic are required to take treatment. There is no charge for this blood pressure examination.

By these periodic examinations it is hoped to ward off disease from the men and loss to the company in accidents and damages caused by an unfit employee. If a man is found physically unable to perform the duties of motorman and conductor and yet is able to do other work, the company endeavors to find some suitable work for him. For those employees who have had fifteen years continuous service and are shown by these tests to be unfitted to carry on their work a pension system is provided, as will be described later.

The relations between the management and the men in Atlanta during the past six years have been in some respects unique. Up to the fall of 1916 the trainmen were unorganized, but an organization was started in that year and the men struck to secure recognition. The strike was one of the worst in the electric railway history. It was accompanied by a great deal of violence and about thirty cars were dynamited. The company finally won, and the chief dynamiters were sent to state prison for terms of from six to ten years.

Digitized by Google

About two years later, while the War Labor Board was functioning, there was a short strike which resulted in another wage increase, and about eighteen months later, or in March, 1920, there was a third strike. This time the cause was the decision of a board of arbitrators which awarded another increase in wages, this time of 15 per cent. This increase was not considered sufficient by the men, who by this time were organized and stayed out for nearly three days. They finally returned to work under the instructions from the national headquarters of the union that the strike would not be recognized.

Last September the national convention of the Amalgamated Association was held in Atlanta and Preston S. Arkwright, president Georgia Railway & Power Company, was invited to address the convention. He did so, and after reciting the history of the company's labor troubles during the past five years, urged the members of the association to engage with the company in another contest, "not as foes but as friends, allies and comrades in arms to make the street railway industry everywhere take the place it is entitled to have." This sentiment has evidently been adopted by the men in Atlanta. Evidence that this is so is given by the issue by the Amalgamated division in Atlanta recently of a pamphlet, entitled "Fares, Hooch, Craps and the Unemployed," which urges all members of the division to give strict attention to duty.

A helpful agent in this spirit of co-operation is a bright eight-page company publication called "Snapshots," published monthly "by and for the workers of the Georgia Railway & Power Company." A typical page is reproduced.

Pensions and Other Co-operative Work

On the first of this year the company announced that it had established a pension plan for employees in all positions who on account of age, infirmity, disease or injury may become unable to perform their duties. This plan is intended to supplement the workmen's compensation law, which makes provision for injuries arising out of employment. Those who have been continuously in the service of the company for thirty years or more and have reached the age of sixty are placed on the retired list and receive 30 per cent of the amount earned during the preceding twelve months, though if the employee desires to continue his work and is considered able to do so the annuity becomes operative when work is discontinued. Employees in the service for twenty-five years and less than thirty years receive 27½ per cent out of their wages earned during the year preceding; those in the service from twenty to twenty-five years and reached the age of sixty receive 25 per cent.

Any employee who has been continuously in the service of the company for fifteen years and has become totally disabled for any cause other than self-inflicted, immorality or injury covered by the workmen's compensation law is placed on the retired list to receive 25 per cent of the salary during the year preceding. The minimum annuity is put at $25 per month and the maximum annuity $100 per month. No provision is made for death benefits or for temporary disability, because both of these cases are covered by the employees' relief association.

Another very practical example of co-operation is an arrangement which the company made with a dentist to do work for employees and members of their immediate family at much reduced rates. The arrangement was that the company would provide office space at the transportation building (with light and heat) without charge, and that the company would collect the dental fees by a small monthly deduction from the payroll of the patient when this plan was desired by the employee. In view of these considerations, the dentist agreed to charge rates only about one-half those charged by first-class dentists outside. A list of these rates with maximum charges has been filed with the company by the dentist. The plan has proved popular.

Another plan, announced March 15, to go into effect April 1, is one in which the company agrees to pay bonuses for accident reduction by the men. Briefly, accidents are divided into three classes, the first class being unavoidable so far as the train crew is concerned; the second, those which might have been avoided if extraordinary care had been used, and the third, those in which the crew was plainly at fault. The bonus is $3 a month for each motorman and conductor whose car does not have accidents of the second or third class, provided they work not less than twenty-five days during the month. The bonuses are paid every quarter, and disputes and controversies with passengers will be classed as some sort of an accident. This bonus plan is confined to trainmen.

Promoting Transportation

Much has been done in Atlanta in the way of promoting transportation and good relations of the public. This is primarily the purpose of "Two Bells," published weekly by the company and distributed through boxes in the cars. "Two Bells" is a little four-page folder with some matter about the company and jokes to make it more readable. Changes in the organization are mentioned so as to introduce the new officers to the public, and the paper is printed on a differently colored paper each week to provide another element of change. A feature is also made of striking utterances by any one in regard to the service. For instance, Mr. Arkwright recently referred to the fact that statistics showed the safest place in Atlanta streets at present is in an Atlanta Street car. This statement was reprinted in "Two Bells" and attracted much comment in the daily papers. Complimentary letters were received by the company, some containing verse with this as a theme. This verse was printed in "Two Bells" with some of the letters.

Another kind of publicity conducted by the company which is notable, because it carries no propaganda, is a series of posters on important historic and other facts relating to Atlanta and Georgia. These are issued weekly and posted in the windows of the cars. They have contained so much instructive information that copies have been eagerly sought by the principals of public schools, not only in Atlanta but throughout Georgia, for posting in the schools. It has been the policy of the company to grant these requests for extra copies, where they have been available.

In addition the company is a member of the Georgia Bureau of Public Utility Information, with headquarters in Atlanta. This bureau is organized like similar bureaus in other states to issue data on public utilities of interest to the public. The Georgia Railway & Power Company also sends out a special weekly bulletin to newspapers, summarizing the industrial conditions in the State. The company is in a good position to obtain

Digitized by Google

this information because of its power business and continues the bulletin as a "good-will" service. To some extent the company also uses the backs of the bills sent out by its light and power departments to explain facts about the railway. It has also reserved in its car advertising contracts the spaces in the front and back of the car over the bulkhead for its own advertising, though sometimes it has donated this space for charitable purposes.

Railway Leads Shop-at-Home Movement

Beaver Valley Traction Company's "Get Acquainted" Poster Reproduced by Local Newspaper as a Compliment —Business Houses Support the Movement in Their Newspaper Advertisements

OWING to the fact that the territory of the Beaver Valley Traction Company and Pittsburgh & Beaver Street Railway is but one to one and one-half hours run from Pittsburgh on the steam trains, there is a strong tendency among shoppers to go to the big city instead of patronizing local stores. Lately this has been accentuated by the institution of ten-trip tickets at reduced prices. In November, 1921, for example, 674 tickets were sold from Rochester alone at a price of $5.27 each.

Although the traction companies might be supposed to suffer least from this, because they still get the short rides to and from the stations, W. H. Boyce, general manager, took a different view. On Oct. 18, 1921, he addressed a letter to the Beaver Falls Advertising Club in which he stated that "too many residents of the Beaver Valley do their shopping in Pittsburgh. As I see it, it is not fair—it is not just. In most cases there is absolutely no necessity for it . . . Most of them are dependent upon the manufacturers and merchants of the Beaver Valley for their living, and the condition of this community is therefore of material interest to them. They can help . . . by doing their shopping at home. Won't your organization do some advertising as a body, or suggest to the individual merchants that they run with their large ads, in a small box space, an appeal to our residents to do their shopping in the Beaver Valley?"

Mr. Boyce then went on to show that his companies had already been practicing his preachment, instancing such examples as the following:

TIRED TO-NITE?

Did you spend the day shopping in Pittsburgh?
Most people agree that the hardest day's work for them is a day spent in looking and buying in Pittsburgh.
Save time and money. Conserve your energy.
Keep Beaver Valley dollars at home.
Do your shopping in the Beaver Valley.

SHOP

For the Dealer as Well as the Article

If you could get a 5 per cent reduction in the price of an article by going a block further down the street you would be inclined to go to that much trouble.

Do you know that the actual intrinsic value of the SERVICE that the Beaver Valley merchant is able to render by reason of his proximity is often worth more than 5 per cent?

Try out our local merchants. They will make good on price, quality and service.

GET ACQUAINTED WITH THE STORES OF YOUR COMMUNITY

Persons not in the habit of shopping in the Beaver Valley but who took advantage of Dollar Day reduced car fares were surprised at the character of the stores and the quality of the articles and prices.

Patronize the stores of the Beaver Valley. Secure a better grade of goods. Save money. Keep Beaver Valley dollars at home.

Preceding this suggestion, Mr. Boyce had, in February, 1921, addressed a letter to every store owner

A Lesson Learned IN XMAS SHOPPING

(*Overheard on a Beaver Valley Traction Car enroute to New Brighton*)

Mrs. A—I certainly found shopping today very pleasant.

Mrs. B—How's that?

Mrs. A—Last week I went to Pittsburgh to do some holiday shopping, but found prices so high and I couldn't find a thing I wanted, so I decided to do my shopping at home. I've been in Beaver Falls all afternoon and found just what I wanted and the prices are much lower.

Mrs. B (laughingly)—I had the same experience last year and since then I've been doing all my shopping in Beaver Falls. My husband says we women will eventually learn.

What is true of Mrs. A. and B., is true with hundreds of other women.

BERKMAN'S

Buy at Home

We have reduced the street car fare so that it will cost you less to do your Christmas shopping in the Beaver Valley.

Book of 100 *Tickets Now* $4.50

On sale at your bank or at this office until December 22nd. Tickets good until used.

The Beaver Valley Traction Company

W. H. BOYCE, *General Manager.*

MERCHANTS AND RAILWAY COMPANY CO-OPERATE IN ADVERTISING IN "BUY-AT-HOME" MOVEMENT

Digitized by Google

in his territory to inspire them to stress the desirability of face-to-face shopping—in other words, get the customer to come into their stores instead of using the telephone. The Dollar Day reduced fares was one practical way in which the railway helped to do this.

Finally, during the Christmas shopping season of 1921 the management placed in all its cars a poster saying: "GET ACQUAINTED *With the Stores and the Store Proprietors in Your Community*," etc. This poster impressed the publisher of the *Daily Times* so favorably that he reproduced it as a free half-page advertisement, with the following text in the upper left-hand corner:

"This is a copy of a large advertisement which the Beaver Valley Traction Company has been carrying in its cars for several days. It is reproduced here without charge as a compliment to the management of the Traction Company and in the hope that it may benefit Beaver Valley merchants."

The "Berkman's" advertisement also shown indicates that Beaver Valley merchants have seen the point of emphasizing the advantage of home shopping, while the railway's "Buy at Home" advertisement has the logical indorsement and encouragement of a timely 10 per cent reduction in fare obtainable through the use of tickets.

While the foregoing gives but a taste of the many things done by the railway to inspire local business and amusement interests to take proper advantage of their opportunities, it is sufficient as a hint of some of the things a live management can do to build up business.

Massachusetts Safety Campaign

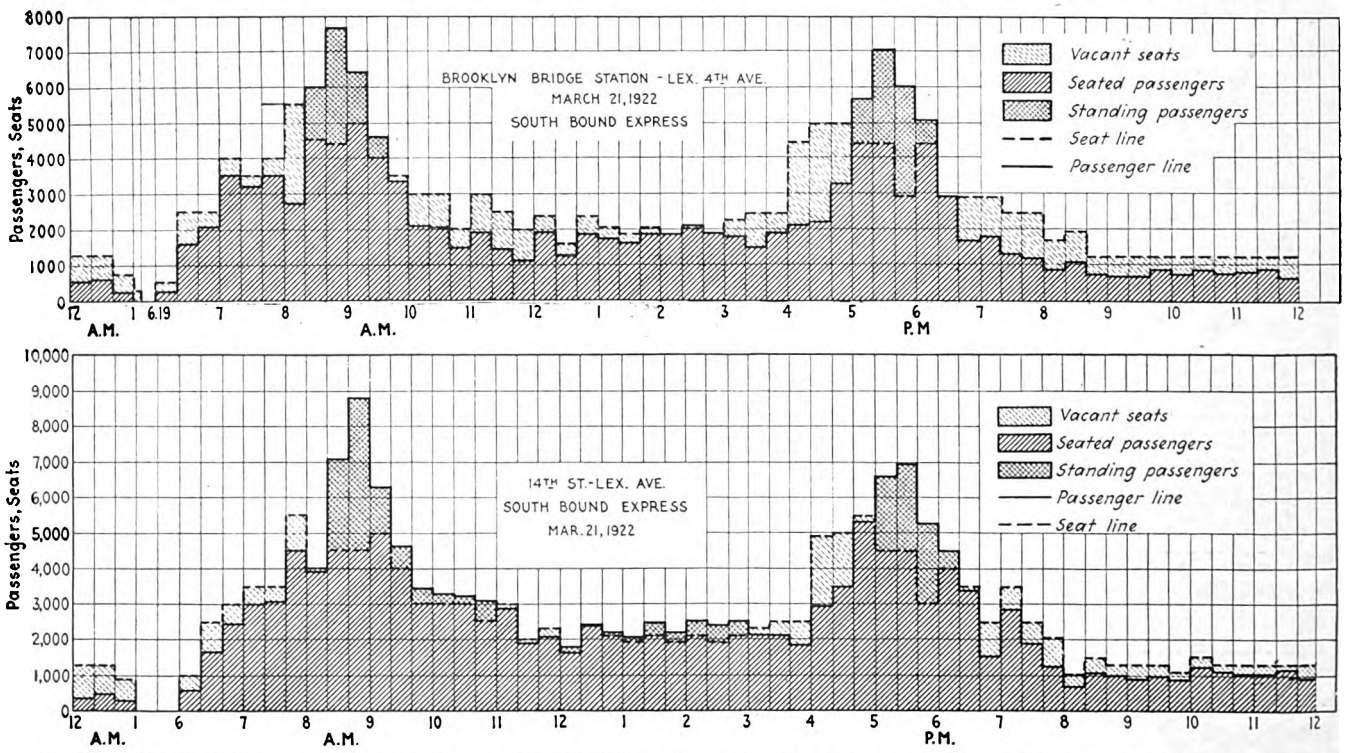
UNDER the direction of the Massachusetts Safety Council, a division of the National Safety Council, a vigorous campaign is being made for the adoption of safety methods and instruction of the public in regard to them. H. Bertram Potter, assistant general manager, Boston Elevated Railway, is one of the vice-presidents of the council, and it has a street railway committee to work out plans of co-operation. In electric railway work the council so far has given special attention to two phases, namely, the child who gets in the track of the trolley car and the motorist who cuts in front.

An effective means of reaching the children has been found to be a little pamphlet entitled "Ten Safety Stories for Young People," designed to be given in the schools and on supervised playgrounds. Each is devoted to some phase of safety, as "How to Cross a Street," "Catching on Behind," "The Trolley Car," etc. Altogether these stories, with an accompanying poster, are being used in 1,185 schoolrooms of the State, and have been sent into several other states.

Interborough Traffic Charts

A FEATURE of the testimony on service standards before the New York Transit Commission during April was the presentation of an extended series of charts of car loadings. They formed part of the testimony offered by the Interborough Rapid Transit Company to show the extent of standing load and vacant seats operated at different times of the day. The charts measure about 50 in. wide x 24 in. high, and one was prepared for each of the principal express and local stations on the route of the Interborough Rapid Transit Company. They represented one day's loadings and were based on observations made by the inspectors of the company.

An attempt will not be made to reproduce all of these charts, but two are shown to illustrate the method of charting this information. One gives statistics as to the southbound express trains at the Brooklyn Bridge station of the Lexington and Fourth Avenue subway on March 21, 1922. The other shows the conditions on the same day and line at the Fourteenth Street station. It will be noticed that most of the standing load is confined to the morning rush hour of from 8:15 to 9:15 and the evening rush period of from 5 to 6:15 p.m.



THE UPPER CHART SHOWS THE LOADING ON THE SOUTHBOUND EXPRESS TRAINS AT THE BROOKLYN BRIDGE STATION OF THE INTERBOROUGH RAPID TRANSIT COMPANY, MARCH 21, 1922. THE LOWER CHART GIVES THE LOADING FOR THE SAME CLASS OF TRAINS, DAY AND LINE AT FOURTEENTH STREET, NEW YORK

Hints on Freight Office Routine

Billing Methods and Machinery and Other Freight Office Routine Are Important in Handling Electric Railway Freight Business—A Simple Method Is Described, Which Insures Accuracy in the Records and Reduces Complaints to a Minimum

BY N. L. DRAGONETTI
Formerly Chief Clerk of Freight, Philadelphia (Pa.) Rapid Transit Company

TO KNOW what you are doing is the most important angle of the electric railway freight business —or any other business, for that matter. The only way that this can be done is by having reliable and accurate records. The very nature of the business, which includes a mass of detail, should convince one of the previous statement. Yet it is strange to note that many freight managers are of the so-called "practical" type, who know little about figures and their interpretation and, in some cases, even pride themselves on the fact that they are not "figure men."

As a rule, the records of a freight office do not nearly approach the degree of accuracy and of modern method of the average business office of today. Briefly, the following outline touches the high spots in the matter of records for an electric railway freight office, and gives a few general hints which should be applied by those now operating a freight service. It should also serve to give the investigator a slight idea of the extent to which trolley freight transportation has progressed.

When goods are presented for shipment, they are always accompanied by a bill of lading in duplicate, or by as many additional copies as the consignor may desire for his own records. The receiver checks the freight against the second copy or shipping order, at the same time noting if the bill is made out properly and if weights are listed. Many errors which cost both the shipper and the carrier money are caused by carelessness in making out bills of lading. It is up to the carrier to educate the shipping public along lines of shipping economy.

If an item which is written hurriedly by hand looks as though it might mean something other than what it is intended to mean, it will invariably receive a higher rating. If this fact escapes detection altogether, the shipper has paid an excessive freight charge. If it is discovered, it has to be corrected and the error, involving only a few pennies as a rule, by reason of the correction causes a loss of time and money. These errors, all of which may be prevented by a little systematic caution, are very costly, and many large business houses that pride themselves on their auditing and freight departments are losing thousands of dollars annually through their poor freight methods. It is a duty in the interest of their clients as well as their own that freight carriers strive to educate their customers along correct shipping lines.

A statement of weights on the bill of lading by the shipper saves money all around, because the shipper knows the weight of his shipment far better than anyone else, and the transportation companies are usually quite willing to accept their weight estimation, being satisfied to subject it to a casual scrutiny at the time of shipment. If it passes the receiver without being questioned it usually goes through as shipped and just as the consignor desires it to go. On the other hand, if no weights are put on the bill of lading, the receiver must put them on and, not having time to weigh each article, he is compelled to resort to estimated standardized weights. This method is very accurate and serves its purpose very well, but it is only natural that a host of errors creep in and many questions arise between shipper and carrier, which when discovered have to be corrected. As a result the shipper has to go back over his records to get his data, take the matter up with the carrier and prove to him that there was an error in estimating weights. This involves a loss of time and money and is rarely worth the amount in question, whereas, had the weights been put on the bill of lading in the first place, all would have gone smoothly.

The platform being roughly divided into spaces for each line, the goods, immediately after being checked, are trucked into their proper pile. As soon as car space is available the shipment is put into the car and proceeds to its destination. The waybills accompany the car and the freight is checked against these at destination. In the case of participating carriers, the goods are checked out of the local car into the foreign car at the transfer point. If this plan is strictly adhered to, there will be few claims for lost goods.

After the shipping order has been checked by the receiver, it is sent to the office for waybilling. The receiver's desk should be located very close to the office and as close as possible to the rate clerk's desk. For these waybills have to be made out almost as fast as they come in and the rate clerk has to walk many miles to and from the receiver's desk carrying in bills of lading if they are not close together.

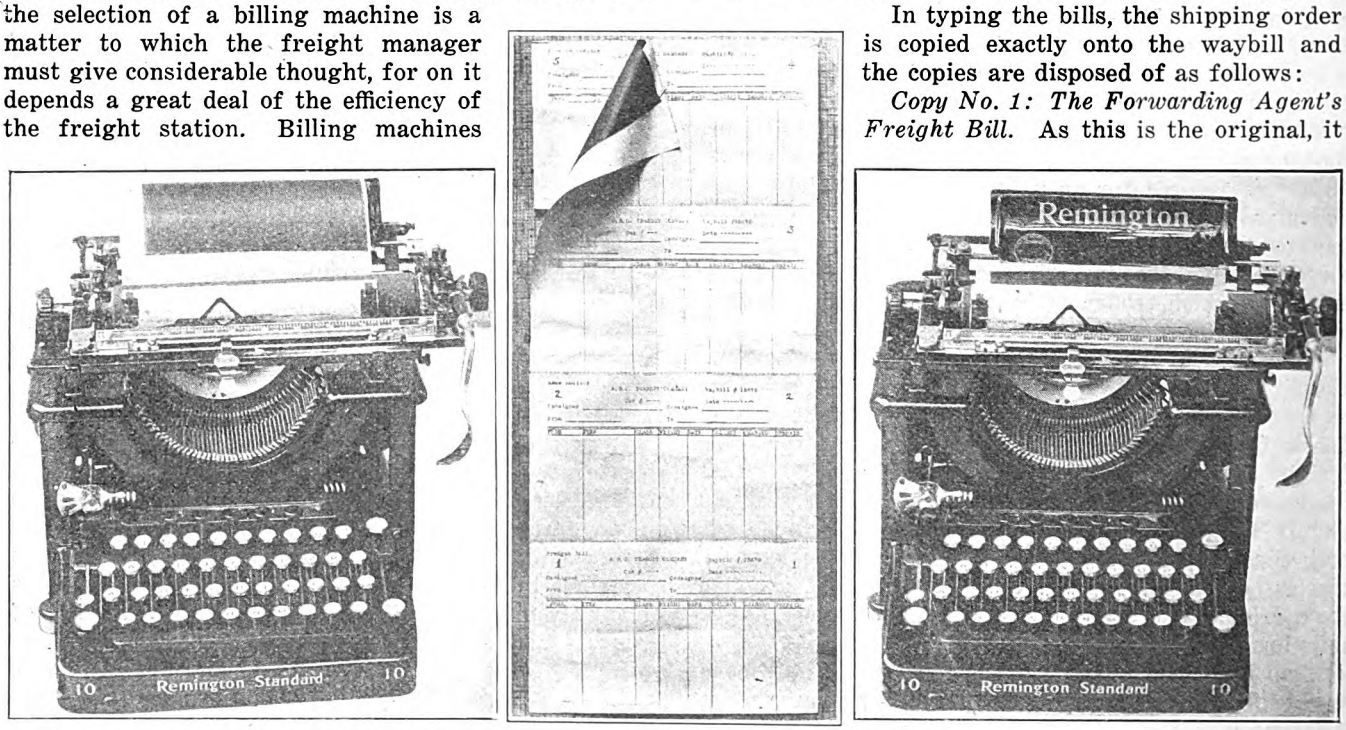
SPECIAL RATE CLERK A NECESSITY

Many freight offices have their bills made out by hand, using copying pencils and carbons, each biller doing his own rating. It has been found that this method is productive of a startling number of errors, and can only result in greatly impaired efficiency. There should be a special rate clerk who does rating and rating exclusively. Since this clerk is constantly referring to the classification and as constantly figuring extensions he becomes in a short time very accurate and swift. He gets to know the extensions of freight rates without any effort at all, in exactly the same way that we are all familiar with the extensions of the multiplication table, which we all learned years ago, and which we apply to almost every problem we attempt. Calculating machines are of little use to the rate clerk, for an intelligent clerk with a fairly good memory can outclass any calculating machine made. Calculating machines, however, are very necessary and useful in the auditing and other departments of the trolley companies, where speed is not such a vital element. After the rate clerks have classified the items and figured the extensions, the shipping order bearing all this information is passed on to the billers.

Digitized by Google

The billers' desks should be located as close to the rate clerks as possible, in order to eliminate any waste time in going to and fro to get bills many times during the day. In fact, the billers' desks can be so arranged that the billers do not have to rise at all to get bills, the rate clerk being so close that he can pass them to the billers as rapidly as is necessary. The element of speed is paramount until the bills are completed, as the bills must be ready before the car is loaded, for if the car is ready to go and the bills are not the car is delayed, occasioning a loss of time and money, and this means, of course, that the car cannot arrive at its destination at its scheduled time. If, on the other hand, the car goes without the bills, the shipments cannot be checked out of the car, and many disputes and claims will result.

There are a great many billing machines and billing methods in existence at the present time. For all of these the claim is made that they are perfectly adapted to freight way billing. Any one of these billing machines would be far better than hand billing. But the selection of a billing machine is a matter to which the freight manager must give considerable thought, for on it depends a great deal of the efficiency of the freight station. Billing machines must be simple, durable, easy of operation, and capable of being easily repaired. From personal experience, it has been found that the following billing method has not been bettered, and it costs hardly anything to demonstrate its superiority.



IN CENTER, ENTIRE WAYBILL, TORN TO SHOW POSITION OF FIFTH COPY AND CARBON. AT LEFT, FIRST POSITION OF WAYBILL IN WRITING MACHINE. AT RIGHT, SHOWING WAYBILL ROLLED AROUND ROLLER, AND IN POSITION TO BE WRITTEN UPON

Waybills usually consist of five copies. These copies are numbered from one to five, the entire bill bearing a serial number which appears on each copy. The copies are separated from each other by perforations, to permit them to be torn easily. These copies are numbered from the bottom up; that is to say, the bottom copy is number one, and so on. The fifth copy, which is at the top, however, is printed on the opposite side to that of the other copies and is folded back along the perforation with its printed side against the rest of the waybill. A carbon, the length of four copies, is inserted in between the fifth copy and the other four, with the carbon side of the paper facing out. The bill is then placed in an ordinary typewriter which has a roller whose circumference is equal to the width of one of the copies, and the bill is rolled around the roller, thus bringing the first copy, or original, direct to the type and the others in their respective numerical positions.

It is rather difficult to explain this plan on paper, but it is extremely simple in operation and an idea may be obtained from the accompanying illustrations. A few hours experimenting along these lines would prove of incalculable value to anyone interested in billing. The bills are inserted in an incredibly short time, billers becoming very readily familiar with the plan, it being only necessary to insert the end of the bill with a quick motion of the hand and roll it up. When the bill is finished a quick pull at the back of the bill brings it out. This billing system has been in practical use for a number of years and has been in direct competition with some of the best billing machines made, and has demonstrated its superiority in every case. The handle of the roller should be slightly larger than is customary, so as to allow the biller to roll the bills up more rapidly.

In typing the bills, the shipping order is copied exactly onto the waybill and the copies are disposed of as follows:

Copy No. 1: The Forwarding Agent's Freight Bill. As this is the original, it is usually forwarded to the shipper for his records in the case of shipment being charged. It shows the amount of his indebtedness to the carrier, and after auditing the charges the consignor usually submits it with payment for the freight.

Copy No. 2: The Home Auditor's Copy. This is forwarded to the home auditor for purposes of auditing and as a permanent record for the auditing department.

Copy No. 3: Delivery Receipt. This accompanies the goods to the destination and is signed by the receiving agent at the time the goods are checked out of the car, either at transfer point or destination, and is returned to the forwarding agent for his files, which of course completes the shipment as far as records are concerned. It is proof of delivery.

Copy No. 4: Delivery Sheet. This accompanies the goods to the destination and is given to the consignee upon delivery.

Copy No. 5: The Foreign Auditor's Copy. This is

Digitized by Google

forwarded to the foreign auditor for purposes of auditing and figuring his share of the freight receipts.

After being waybilled, the bills of lading are arranged in numerical order and sorted into as many lines as there are participating carriers. From these sorted bills of lading an abstract is made showing number of waybill, name of shipper, destination, weight, amount of charges, and whether collect, charged or prepaid. One copy is retained for files and two copies go to the auditor for his records. The bills of lading are then filed in numerical order by lines and a separate file is made up daily. These files are referred to constantly and are very valuable in settling claims, hence great care must be exercised in their preparation.

All of the number one copies of the waybill that are charged are picked out and sorted into lines. They are listed by amounts and compared with the totals of the charge columns of the abstracts. In this way the errors in billing and abstracting are discovered, which is necessary in order to keep the bookkeepers' records straight. Each line is proved out in the same way, and the listed charges after being recapitulated should agree with the recapitulation of the abstracts. The charge bills are then sorted into alphabetical order by shippers' names and entered into a journal, the total equaling the charges on the abstracts. The bills are then mailed to the customer and the items in the journal posted to the accounts receivable ledger, the totals of the journal being posted to the proper controlling accounts.

Cash prepaid bills are balanced in the same way as the charge bills, with the exception that they travel from the receiver to the cashier, who figures the extension, collects the money, lists the waybill number, destination, shipper's name and amount on a sheet, and passes the bill on to the billers for billing. At the close of the day the totals of the cashier's sheet should equal the totals of the prepaid columns on the abstracts. Money received for accounts receivable is listed on a credit sheet and turned over to the cashier for deposit along with the other cash receipts. The cashier lists these amounts and checks with the bookkeeper's records and, after verification, the totals are posted to the proper controlling accounts.

Whenever an error is discovered a correction notice is issued in quadruplicate showing how the bill appears and how it should appear. One copy is attached to the shipping order, one is forwarded to the home auditor, one to the foreign auditor and one to foreign station affected by the change.

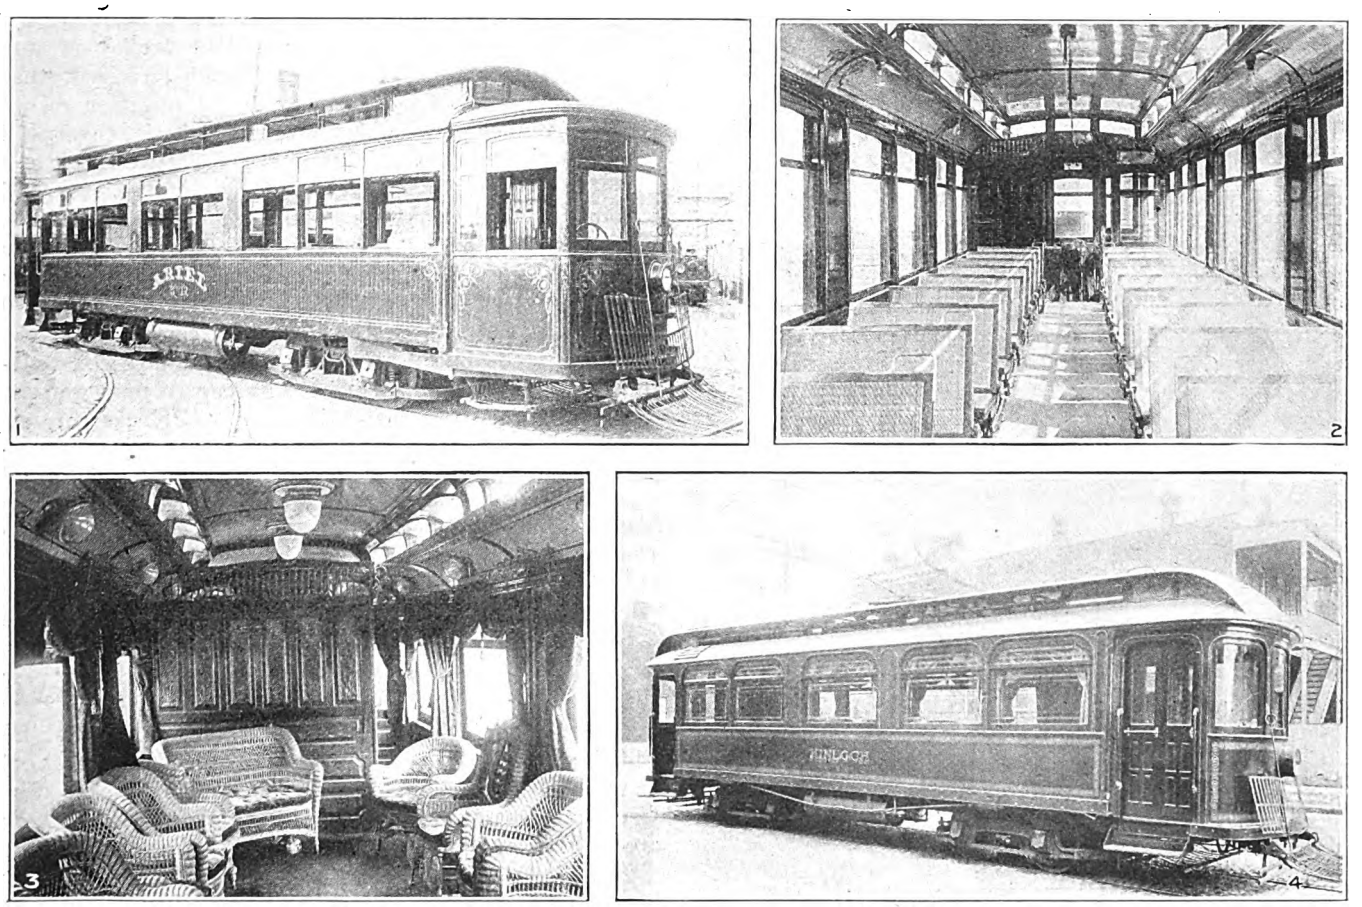
Signed delivery receipts should be filed and kept on record at the office for the purpose of reference in settling claims. They are used constantly and will save many dollars in claims if kept properly.

"Special" Car Service in St. Louis

Private Parlor Cars of Former Days Now Rented for Special Parties—Only One Retains Original Luxurious Furnishings

TWO of the three special parlor cars of the United Railways of St. Louis, relics of World's Fair days (1904) and formerly used by officials of constituent lines before the consolidation of the companies in 1907, have been converted into "specials" and are earning their keep instead of accumulating more rust as they did for several years of comparative inactivity.

One of the three parlor cars, the Kinloch, is kept in its original form, with movable and wide wicker chairs



SPECIAL CARS IN ST. LOUIS—CONVERTED BY EQUIPMENT WITH STANDARD SEATS AND PARLOR TYPE

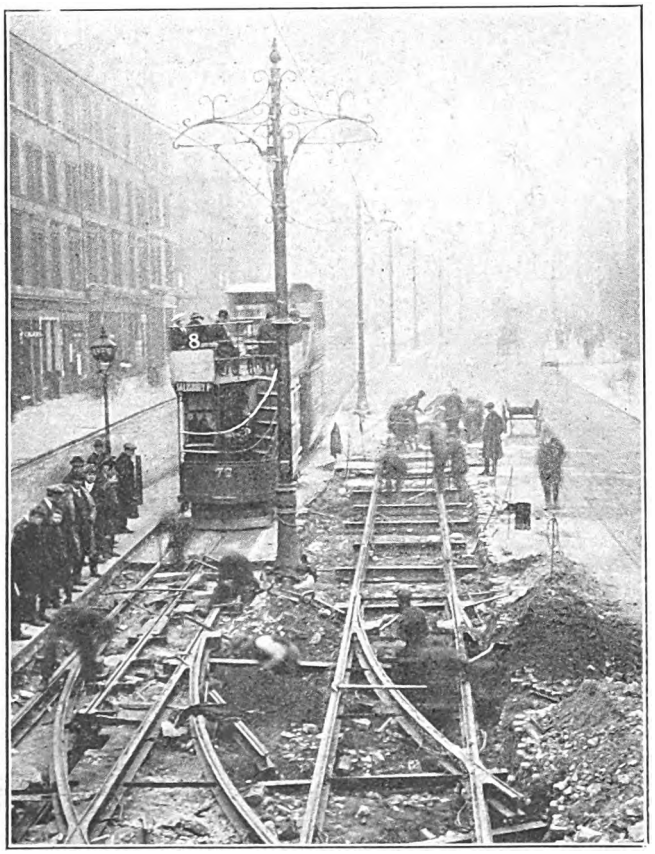
Digitized by Google

and plush upholstery, and is in occasional demand for parties of distinguished visitors. In the last six months, however, it has been in service only 15.15 hours, showing a mileage of 110.75 and a revenue of $71. It may also go the way of its companions, the Electra and Ariel, and thus mark the final passing of luxurious parlor trolley car travel in St. Louis. It seats twenty-six passengers.

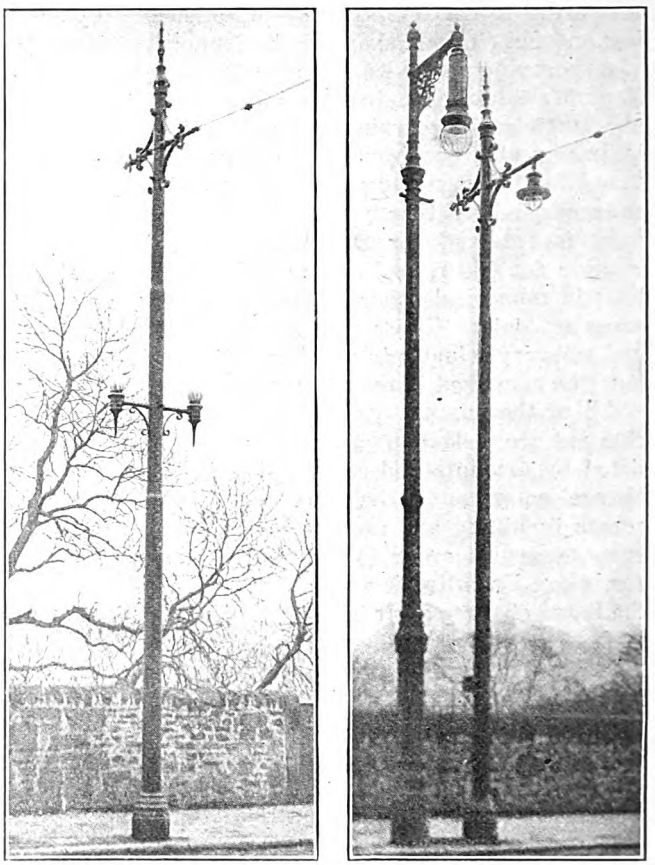
The management removed and sold the old furnishings of the Ariel and Electra and put in ordinary seats, giving each a capacity of forty passengers. The cost of alterations was about $800 for each car. They are advertised as "specials" and used for party trips—clubs, secret societies, visiting delegations, etc. In six months the revenue from Ariel was $543 and from Electra $154. Ariel's mileage was 587, car-hours 161.45, revenue per car mile 0.93 and revenue per car-hour $3.29. The charge is $8 an hour from the time it leaves the shed until it returns to the shed. The charge for the sole surviving parlor car, Kinloch, is $10 an hour, and when the difference in types of car and service charge is explained to the inquirer the usual preference expressed is for the "special" rather than the "parlor" coach.

Attractive Overhead Construction in Edinburgh

ONE of the reasons for the adoption of cable traction in Edinburgh instead of the trolley in the early days of mechanical traction was that residents of that city take great pride in the appearance of Princes Street. It is undoubtedly one of the finest streets in the world, passing as it does Edinburgh Castle as well as monuments to some of the famous men of Scotland.



LINKING UP THE EXISTING LEIGH TROLLEY SYSTEM WITH THE EDINBURGH CABLE SYSTEM, SOON TO BE ELECTRIFIED



AT LEFT—SPAN POLE WITH FLAMBEAU LIGHTING FIXTURE TO BE USED ON THE CENTER POLES ON PRINCES STREET. AT RIGHT —THE OLD AND THE NEW METHODS OF STREET LIGHTING IN EDINBURGH

At the time the cable system was adopted for Edinburgh the underground electric railway conduit system had not been developed and even the trolley system was in its infancy. When it was decided recently that the cable system must come out, the question of an electric conduit system or a very attractive overhead system was vigorously debated in the City Council and by citizens generally. Those in favor of the overhead system included the general manager of the tramways, R. Stuart Pilcher. The matter was finally referred to the Ministry of Transport, which held public hearings on the subject and rendered a decision on April 10 in favor of the overhead system with center poles.

In the meantime designs for a center-pole construction had been prepared by the tramway management and submitted for inspection. For Princes Street, which is about 70 ft. wide from curb to curb, the proposed plan calls for a devil strip only 6 ft. wide, and center poles with short brackets so that the trolley poles have an inside rake toward the trolley wire. These center poles are designed to carry incandescent light fixtures with flambeau or torch-shaped globes. The design of these lighting fixtures is shown on a side pole to which they have been attached for demonstration purposes. Another view shows the old and the new system of street lighting in Edinburgh. In the new method the lamp is hung on the span pole, so that no additional pole at that point is required. The third view shows a section of overhead double bracket construction already completed, but in this case the brackets are of standard length.

The electrical equipment of Princes Street will not be undertaken for some six months. The poles have got to be designed and built. Moreover, so many tour-

Digitized by Google

ists visit Edinburgh during the summer that it has not been thought wise to begin actual construction on the new equipment until the tourist season is largely over.

Letter to the Editors

Railroad Electrification and the Bell Telephone System

AMERICAN TELEPHONE & TELEGRAPH COMPANY

NEW YORK, N. Y., April 27, 1922.

To the Editors:

I am inclosing herewith a copy of a letter which I have written to George Gibbs with reference to his article on railroad electrification recently published in your journal.

I have thought that the position of the American Telephone & Telegraph Company in regard to railroad electrification from the viewpoint of the telephone companies of the Bell System was of sufficient general interest so that you would be willing to publish this note and the inclosed letter.

B. GHERARDI,
Vice-President and Chief Engineer.

EDITORS' NOTE—The body of the letter from Mr. Gherardi to Mr. Gibbs is reprinted below.

I have read with great interest the abstract of your article in the ELECTRIC RAILWAY JOURNAL of Jan. 28, 1922, entitled "Electric Traction on Heavy Traffic Lines." This article, coming as it does from an engineer of such experience and standing as yourself, is, in my judgment, a most important contribution to the subject with which it deals. In the abstract I note the following paragraph:

"It would appear that the development of electric systems is proceeding along normal and logical lines. However, there is some reason to feel that this orderly consideration of the subject may not continue, because of the views which are being expressed by those who are not engaged in operating the railways, but are connected with other industries, including manufacturing, telegraph and telephone service and power generation. While these interests have decided views and are expressing them, the railroads, which must use the apparatus, have not considered it necessary actively to advocate any particular electric system."

After reading the abstract referred to above, I have consulted the original to see whether the abstract correctly expresses your views as given in the original paper. It appears to me that it does.

What you say about the views which are being expressed by those connected with the telephone and telegraph industry leads me to write this letter with reference to the position of the American Telephone & Telegraph Company in regard to railroad electrification, in order to make it clear that the companies of the Bell Telephone System need not be feared as a factor likely to interfere with the orderly consideration of the railroad electrification problem. I wish to state definitely and without qualification that this company is not aligned on either side of the a.c. vs. d.c. controversy. The only interest of the telephone company in this matter is that as railroad electrification is installed it shall be so designed and operated as not to impair or destroy the telephone company's service. Subject to this point, the type of electrification of railroads is a matter of no concern to us.

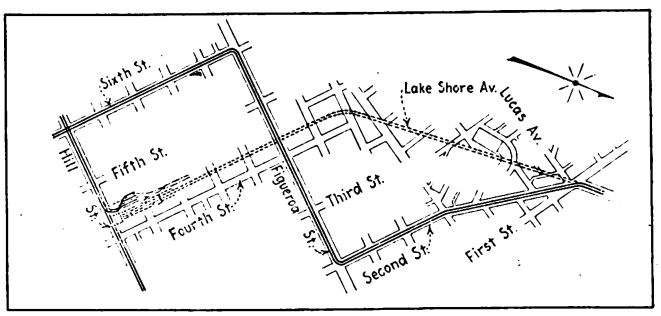
With either the a.c. system or the d.c. system of electrification, the design may be such as seriously to impair the telephone company's service if careful study of this phase of the question is not included in the planning. On the other hand, with either system the designs and arrangements can be so worked out as not to impair this service. From experience up to the present time with electrification projects of both types, it is clear that much more extensive precautions and greater expense are required to provide the measures necessary to avoid interference to communication service with the a.c. system than with the d.c. system. This is not in any sense a matter of opinion or argument, but simply a fact which, as far as I know, has not been questioned.

I hold the railroad companies and their officials and engineers in high esteem and I know that it is their desire and intention to avoid impairing the telephone company's service. This has been true in the case of those railroads with which the questions concerning electrification have already come up, and I know it will be equally true with the railroads planning electrification in the future. In some cases, however, there is not a full appreciation of the steps which it is necessary to take in order to avoid impairment of the telephone company's service, and the extent to which it is necessary for the telephone engineers to work in cooperation with the railroad representatives to establish the facts and to assist the railroad in determining the steps which must be taken to protect the telephone company's service. This must be done while the electrification plans are being worked out, as it is only at that time that the measures which may be indicated to prevent impairment of telephone and telegraph service can be properly incorporated in the general plans, and also because, obviously, this is the time when the relative costs of such measures should be considered and due weight given to the bearing they may have on the choice of systems.

Projected Subway in Los Angeles

THE Pacific Electric Railway has made an application to the city of Los Angeles for a forty-year franchise to operate trains through a subway which it proposes to bore between its Hill Street terminal and Glendale Boulevard. Such a subway would bring the San Fernando Valley towns, and Glendale, Burbank and Hollywood, ten minutes closer to Broadway and would be an important step in the solution of the city's traffic problem. It is understood that work will begin as soon as the franchise is granted.

The improvement was ordered on Dec. 24, 1921, by the California Railroad Commission, following its decision granting the Pacific Electric an increase in passenger rates, and the company's officials state they are ready to commence the work on short notice. It is expected that two years would elapse before the work could be finished. The proposed tunnel, it is expected, will cost approximately $1,850,000, and fifty new multiple-unit cars, already ordered to operate over the new cutoff, will cost $900,000. The tunnel will be 1 mile long. Among its outstanding features will be:



PROPOSED ROUTE OF SUBWAY CUT-OFF IN LOS ANGELES

The removal of at least fifty grade crossings for not less than 250 trains a day.

Shortening of the running time between San Fernando Valley points, Glendale, Burbank and Hollywood, to Los Angeles, by at least ten minutes.

Taking a number of through trains off of the streets and thereby relieving congestion, reducing liability to accidents and speeding up the other cars on those streets.

Selling Transportation*

Various Methods Are Followed for Interesting the Salesmen in Giving Personal Service and for Discouraging Automobile Competition

BY G. I. PLUMMER
Superintendent of Transportation, Dallas (Tex.) Railway

SELLING transportation involves exactly the same elements of human psychology as the selling of any other commodity. In this paper only the practical aspects of selling transportation will be discussed, and for the most part the material developed is the result of our own experience in the effort to sell street car service in Dallas. One who would sell something successfully must know his commodity as it actually exists, and must have a comparative knowledge of similar commodities elsewhere. His attitude must be analytical, in that he is not content with accepting things as they are, but instead is of a disposition to discover how conditions may be made better. To sell transportation successfully, it is necessary that the commodity have real value. This value must be so tangible and apparent that the prospective purchaser will recognize the value when he comes in contact with the service. In our own case we undertook to study the conditions of our service. This analysis revealed many opportunities for improvement, and we are working constantly on details whereby our service will be improved.

Practically all salesmanship is the result of the contact of minds. In the street railway business the man who sells, or fails to sell, rides is the conductor or motorman. The public recognizes in the trainman a representative of the company, and so interprets the service he gives. Consistent effort should be made to impress trainmen with the importance of giving the correct interpretation of the company's attitude toward the public. In place of the "hard boiled" service commonly received, passengers on the street cars should be impressed with the friendly, kindly, attentive, personal service the trainmen attempt to give.

When a traveler boards the street car at the Union Station, the conductor smilingly welcomes him to the city with a cheery "Good morning," or proper salutation, and invariably should follow with, "May I direct you anywhere in the city, sir?" or a similar remark. When not too busy, the trainman should make it a point to remark that the visitor has come to a good town, and that he is glad to have him. Trainmen should carry maps of the city so that they can give detailed information when requested. This is an example of what is meant by "personal service" on the part of trainmen. Naturally every one who rides the street cars is entitled to expect normal street car service, and this is taken for granted. An effort should be made to sell the service by the uncalled-for, unusual, attentions, and friendly contact between trainmen and the public. In this connection, trainmen should be always alert to improve the conditions of service, and frequently suggestions of great value may be received from them.

TRAINMEN WRITE CAR CARDS

As an example in Dallas, each of our street cars carries "car cards" of the company. These cards frequently are written by our trainmen, and their names appear on the cards as the authors. Reflecting the attitude of these men, the following messages they have written are suggestive. One carries the picture of our trainman who has been longest in the service. Under his picture is a brief statement of his seniority, and in large type, opposite the picture, under the head: *"Personal Service.* Each trainman wishes to give you the kind of service his best friend deserves. He, personally, wants you to be proud of Dallas and its street car service."

Another ad reads: *"Friendly service.* All trainmen are glad to go out of their way to give you real service. They are proud of their work for a greater and better Dallas."

It will be noted that an effort is made in these advertisements to associate our street car service with the reputation of the city. Those of you who are acquainted with Dallas know that its civic pride is unexcelled and that this effort, if successful, ties the street car service inseparably with the pride of the city.

Another of these advertisements reflecting personal service reads: *"Pleased to Serve.* Parents may safely trust their children of school age on the street car. Trainmen derive personal pleasure seeing that the little ones arrive safely." This card was illustrated by a picture of its author, a trainman, aiding a small school child aboard the car.

This type of advertising has assisted salesmanship, not only by acquainting the public with our attitude, but also has served as a guide for trainmen in their efforts to improve their service. Some of the older men have been inclined to look upon this new way of doing things with some opposition, and the advertisements written by the trainmen and posted on the bulletin boards have done much to whip these men into line. In order to sell unusually good service, we find that the idea must be sold first to the trainmen. We treat them as we would have them treat their passengers. A reward of $5 is paid for each advertisement accepted from trainmen.

The service on the cars should be rendered as personal as possible. Trainmen who have caught the spirit that passengers are really their guests seldom fail to demonstrate that they appreciate their business. This is shown by their attention to elderly or infirm people. They always assist women with packages, and do the other little services that show their friendly interest for the passengers. Our attitude in this regard is reflected by a "car card" advertisement we have carried. It follows: *"Read Matthew 7:12.* Our idea of how our patrons should be treated is simple: That we treat them as we would have them treat us were they in our place and we in theirs."

Much of the unfriendly criticism of street railway service comes from those who have been required to wait as the result of unavoidable delays or traffic tie-ups. To overcome this trainmen should make it a universal practice to tell passengers in a brief way the cause of the delay. After a person has waited twenty minutes for a car much of the sting is taken away if the conductor remarks, "Sorry to have kept you waiting, sir, but a freight train held us up," or "automobile broke down on the track," or "automobile ran into the car," etc. These explanatory remarks not only give the passengers a basis for correct appraisal of the service, but also convey to him the trainman's personal interest in giving him good service.

In selling service we should analyze to determine those factors that passengers demand to be present. You will find that the requirement is for service in which dependability, rapidity, courtesy and safety are emphasized. With this in mind, advertise consistently, emphasizing these four elements. A suggestion for one of these advertisements follows: *"Ride the Street Cars.* It takes you there; it brings you back. Uniformly courteous service. Always safe, quick and economical."

The wording of this advertisement should be changed frequently, but the thought back of it should never be lost. It is a well-known fact that people learn and believe by being impressed forcefully and frequently by the same thing. Utilize this principle in selling service and hammer constantly to drive into the minds of the passengers the truth of the statement. One morning a sudden cold snap practically paralyzed all traffic except the street cars. All daily papers simultaneously carried the bold announcement that the street car was the one dependable type of transportation, and emphasized the satisfaction of riding the street car as compared with the exasperating and expensive use of the automobile on such occasions.

MEETING AUTOMOBILE COMPETITION

The automobile is the competitor of the street car. Recognizing this, advertise constantly in such a way as to emphasize the superiority of street car service over the use of the automobile.

*Abstract of paper presented before the Street and Interurban Railway Section of the Southwestern Electrical and Gas Association, San Antonio, Tex., May 3-6, 1922.

Digitized by Google

Advertisements should point out the place of automobiles as pleasure vehicles, and then demonstrate how the street car is much more economical for ordinary daily business purposes.

The public can be encouraged to assist in the improvement of service by buying metal tokens. In this connection, each conductor should give at least two tokens in change when a coin larger than a dime is presented for fare. In this way the passenger receives his return fare and does not have to bother with change. You will find that one does not hesitate to spend a metal token as much as real coin. Accordingly, the person who carries metal tokens likely will ride the street car more frequently than those who pay straight cash fares. To this end the sale of metal tokens should be stressed, and many passengers will buy them in rolls of twenty each. Through the personal contact of trainmen and by means of advertising, many passengers will form the habit of buying a stock of metal tokens at the beginning of the week, thus providing transportation for days at a time.

Selling transportation has been a matter of much concern to us in Dallas. We have attempted to put over the sale by studying the service from every possible angle. We have injected an attitude of friendly, helpful co-operation between our trainmen and the public. Our advertisements by means of "Trolleygrams" (distributed on the street cars), car cards posted in the cars, and newspaper advertising and publicity, have always been centered on creating a friendly attitude on the part of the public, and studying concretely the things in our service that suggest a basis for the kindly opinion of the rider.

By way of summary, we have regarded the sale of street car rides in the same light as the manager of a department store views the sale of his goods. We have tried to create a commodity of such outstanding excellence in its mechanical and human elements that the prospective purchaser automatically thinks of the rapid, safe, economical and dependable "yellow electric limousines" when he wants to do something that involves going somewhere in Dallas.

Speakers for Canadian Association Convention Announced

SUPPLEMENTING the skeleton program for the Quebec convention of the Canadian Electric Railway Association, given in the April 29 issue of this paper, the following rounds out the program as completed to date:

The addresses of welcome on Thursday, June 1, will be given by Lieut.-Gov. Sir Charles Fitzpatrick and Mayor Samson of Quebec.

On Thursday afternoon Dr. Louis Herdt, consulting engineer, Montreal, will speak on "Valuation of Street Railway Assets, Their Maintenance and Depreciation." This will be followed by a paper on "The Modern Street Railway Motor," by J. K. Stotz, Canadian Westinghouse Company, with discussion by W. G. Gordon, Canadian General Electric Company, and W. R. McRae, Toronto Transportation Commission.

On the morning of Friday, June 2, D. E. Blair, Montreal Tramways, will read a paper "Motor Buses and Trackless Trolleys." In the afternoon there will be a paper on "Welded Track Joints," by E. B. Entwisle, Lorain Steel Company, and a motion picture exhibit by courtesy of the National Safety League and the Dominion Wheel & Foundries, Ltd.

Up to May 1 the following exhibitors had been listed for the convention: Canadian Westinghouse Manufacturing Company; Ohio Brass Company; Taylor Electric Truck Company; Ottawa Car Manufacturing Company; Canadian General Electric Company; Lyman Tube & Supply Company; Dominion Wheel & Foundries; Railway & Power Engineering Corporation; National Pneumatic Company; Nichols-Lintern Company; Canadian Power & Foundry Company; Witherow Steel Company; Consolidated Steel Corporation; Canadian Street Car Advertising Company; Don M. Campbell, mechanical engineer; Transit Equipment Company; McGuire-Cummings Manufacturing Company; Cleveland Armature Works; Lindsley Brothers (Canadian) Company; the Tool Steel Gear & Pinion Company; Southam Press; Canadian Cleveland Fare-Box Company; Universal Lubricating Company; Arthur Power-Saving Recorder Company; Canadian National Carbon Company; Standard Underground Cable Company; Canadian Brill Company; the J. G. Brill Company; Eugene Phillips Electrical Works; Canadian Steel, Ltd.; Hunters Joint Block Company; Cheatham Electric Switching Device Company; Nachod Signal Company; United States Steel Products Company; C. E. A. Carr Company; Dawson & Company; "Silent Conductor" Company; Northern Electric Company; Sarnia Bridge Company; Ontario Safety League; Vickers, Ltd.; *Canadian Railway & Marine World, Electric Traction, Electrical News,* ELECTRIC RAILWAY JOURNAL.

Adjusting Track Construction to the Lightweight Car*

An Account of Two Track Jobs Recently Completed in Fort Worth, in Which Advantage Was Taken of the Light Weight of the Birney Cars Operated There in Cheapening Construction

BY R. G. TABER
Division of Construction and Engineering, Stone & Webster

SINCE 1906, when the writer first became associated with Stone & Webster, track construction for permanently paved streets has undergone radical changes. There still exists considerable difference of opinion as to what constitutes the best type of construction for paved streets, but all agree that what we are striving for is to find that type of track construction of first low cost which gives a long life with an economical maintenance cost.

*Abstract of paper presented before the Street and Interurban Railway Section of the Southwestern Electrical and Gas Association, San Antonio, Tex., May 3-6, 1922.

The most successful type with which the writer has had experience is what may be termed the "sandwich" type. This involves a sub-base of concrete, gravel ballast, the track itself, the paving base and the surface. The sub-base assures uniform resistance of the substructure. The gravel ballast transmits the load from the ties and its flexibility allows the track to be brought to a true surface. It also allows immediate operation of cars on completion of the job. Furthermore it provides resilience. The ties take the load from the rail, distributing it through the ballast, while the rails

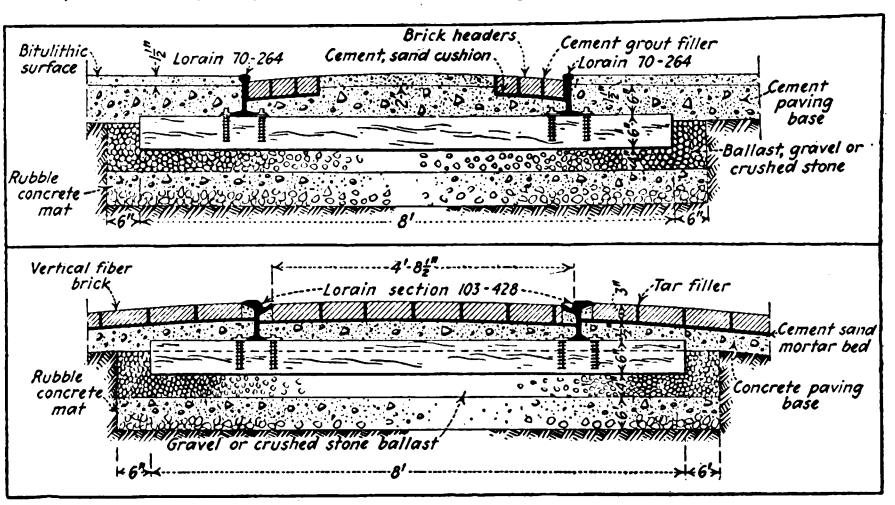

FIG. 1, ABOVE—TRACK USED IN FORT WORTH FOR SAFETY CAR TRAFFIC ONLY (SEE TABLE I). FIG. 2, BELOW—FORT WORTH TRACK FOR CONGESTED DOWNTOWN STREETS (SEE TABLE II)

Digitized by Google

TABLE I—DATA FOR TRACK AS IN FIG. 1

Material for 1 mile of track

Item	Kind	Size	Quantity	Remarks
Rail	High-tee	70-lb.	110 tons	
Joints	Simplex bars	70-lb.	180 pairs	
Bolts	Machine	⅞-in. x 3½-in.	360	
Tie plates	Sellars	6-in. x 9-in. x ½-in.	5,300	4,524 with ties on 28-in. centers
Spikes	Screw	⅝-in. x 6-in.	11,000	9,050 with ties on 28-in. centers
Ties	Pine	6-in. x 8-in. x 8-ft.	2,650	2,262 with ties on 28-in. centers
Ballast	Gravel	¼-in. to 2-in.	1,250 cu.yd.	
Pavement	Bitulithic	2-in. thick	3,520 sq.yd.	
Brick headers	Vertical fiber	3-in. x 4-in. x 8-in.	47,000	
Concrete	Paving base		850 cu.yd.	
Concrete	Mat		880 cu.yd.	

TABLE II—DATA FOR TRACK AS IN FIG. 2

Material for 1 mile of track

Item	Kind	Size	Quantity	Remarks
Rail	Groove	103-lb.	162 tons	
Joints	Apex bars	103-lb.	180 pairs	
Bolts	Machine	⅞ x 3-in.	360	
Tie plates	Sellars	½ x 7-in. x 10-in.	5,300	
Spikes	Screw	⅝-in. x 6-in.	11,000	
Ties	Pine	6-in. x 8-in. x 8-ft.	2,262	
Ballast	Gravel	¼-in. to 2-in.	1,250 cu.yd.	
Pavement	Brick	3-in. x 4-in. x 8-in.	80,000	
Filler	Tar		70 cu.yd.	
Mortar bed	Cement sand		65,000 lb.	
Concrete	Paving base		850 cu.yd.	
Concrete	Mat		880 cu.yd.	

furnish the requisite stiffness for the structure, especially after the paving base has been poured.

A radical change, which should have due consideration in the designing of track, is that which is due to the modern lightweight equipment. It is inconsistent to build track for the 15,000-lb. Birney cars as heavy as that which is necessary for double-truck 44,000-lb. cars. Although modern equipment is less than half the weight of old designs, this does not mean that the track weight can be reduced proportionately. It does mean, however, that there is another factor to be considered in the design of street railway track construction.

Working along the line of lighter construction of track for use with lighter cars, the writer first attacked the matter of tie spacing. The standard spacing is 2 ft., but on two track jobs just completed in Fort Worth the ties are placed on 28-in. centers.

On these tracks, on which Birney cars are operated, there is a 6-in. concrete sub-base, with 4 in. of ballast under the ties. Tie plates are used on every tie, and other details include screw spikes, 7-in. 70-lb. tee-rail, brick headers next to the rail on the inside of the track, a 6-in. concrete paving base and a 2-in. "bitulithic" wearing surface. The total length of the two jobs is somewhat over a mile.

The saving on these jobs was 378 ties, which at the rate of $1.77 saved $650, or 13½ per cent, on the tie account. While this amount may seem small, in a city having an 80-mile street railway system the saving alone on ties at this rate would amount to $2,600 per year, assuming a life of twenty years for a tie. The saving would apply under current conditions as to prices if tie plates and spikes are included.

The tie is only one item. The writer firmly believes that if engineers will pull together they can make large savings in other directions. Take, for example, the rails; in place of the special rolled sections which have been considered necessary in the past, with lighter equipment it ought to be possible to find a standard section that will meet the requirements.

The next important step after agreement has been reached as to the best type of construction for either heavy traffic or light traffic is provision for proper supervision. This is a matter which usually does not have sufficient attention.

Referring to the illustrations of track cross-sections used at Fort Worth, Fig. 1 is the construction now being used for the track for the lightweight Birney car. Fig. 2 shows the type being used in the downtown section for heavy traffic where double-truck and interurban cars operate. While concrete sub-base is used in both cases, the writer does not believe that this is necessary where the soil and other natural conditions provide suitable drainage.

Pennsylvania Association Meets June 1

THE following tentative program has been prepared by the Pennsylvania Street Railway Association for the annual meeting to be held at the Penn-Harris Hotel in Harrisburg, Pa., on June 1 and 2:

JUNE 1

Address by President T. B. Donnelly, West Penn Traction Company.
Reports of committees.
Report of Secretary and Treasurer, Henry M. Stine.
Report of special jitney committee.
Paper on "Power-House Economics," by David B. Ainey, consulting engineer, Harrisburg, Pa.
Paper on "Light-Weight Double-Truck Cars," by W. J. Clardy, railway engineer, Westinghouse Electric & Manufacturing Company.

JUNE 2

Paper on "Recent Developments in Concrete," by D. A. Tomlinson, Chicago, Ill., manager railway bureau Portland Cement Association.
Association business, including election of officers.

On Thursday evening will occur the annual dinner, which will be informal and held at the hotel. Members and special guests are invited. Hon. W. D. B. Ainey, chairman Pennsylvania Public Service Commission, and Robert I. Todd, president of the American Association, are expected to be among the speakers at the dinner.

Transport Congress

A CONGRESS of the Institute of Transport will be held in London May 17-19. Technical sessions will be held in the mornings, and visits and inspections will be made in the afternoons. A delegate's or visitor's card will afford free travel on the bus, tramway and subway lines in London during the three days. The president of the Institute is Lord Ashfield, and H. E. Blain of the London Underground Railway is honorary secretary.

The papers include addresses on all branches of transport. Those related to street transportation include the following: "Highways in Relation to the Development of Mechanically Propelled Vehicular Traffic," "Road Vehicles for Passenger and Goods Service," "The Finance of the Modern Highway," "'Safety' Railway Operation," "The Operation of Suburban Passenger Service on Steam Railways, with Particular Reference to Density of Service, Terminal and Other Facilities."

This is the first congress held in London devoted to all branches of transport.

International Tramways Union

A REORGANIZATION meeting of the International Tramways Union was held in Brussels on Feb. 18, so as to exclude the tramways in Germany and its allies during the war. One hundred and twenty-eight members were present, including representatives from tramways in France, Belgium, Italy, Holland, Switzerland, Rumania, Denmark, Norway and other countries.

It was decided to adopt as the new name of the association, Union Internationale de Tramways, de Chemins de Fer d'Intérêt Local et de Transports Publics Automobiles. There will be four kinds of members as follows: Class A, companies operating tramway, interurban railway or bus systems; class B, officers, engineers or heads of departments of such companies; class C, manufacturing companies or associations, city or other organizations interested in the industry, and class D, individuals interested in the industry. The official language will be French, and the next convention will be held in Brussels during the first two weeks of October, 1922.

The following were elected members of the executive committee: C. de Burlet, Brussels; H. Géron, Brussels; J. Kessels, Brussels; Ch. Thonet, Brussels; A. Mariage, Paris; G. Pavie, Paris; Ch. Rochat, Geneva; Kai Norregaard, Copenhagen; Le Marquis de Foronda, Barcelona; F. Level, Paris; L. Boulle, Paris; J. W. van de Vegt, Rotterdam; J. F. S. Barth, Christiania.

A. S. T. M. Meets June 26 to 30

THE twenty-fifth annual meeting of the American Society for Testing Materials will be held at the Chalfonte-Haddon Hall, Atlantic City, N. J., June 26 to 30. Details of the provisional program will be published later.

Tramway Conditions in France*

High Costs of Operation with Inadequate Fare Increases Have Greatly Affected Tramway Conditions—Tendency Now Toward Subsidized Service

By M. Guiffart
General Manager Compagnie Générale, Française de Tramways

THE war had a very depressing effect on all transportation enterprises in Europe because of increased costs and reduced travel. Economies in engineering and operating practice have offset this condition to only an insignificant extent. Increases in rates of fare appear to be practically the only remedy, but this remedy arouses the hostility of the public, and there has been a great temptation for communities to take over the property at depreciated valuations.

In Great Britain, where municipal tramway operation is particularly developed, wages were more than doubled during the war, in spite of the very considerable employment of female help. At the same time the cost of all materials rose rapidly. It was not until 1918 that a general law permitting fare increases was passed. Fortunately, the industrial activity in the cities where most tramways are located helped to overcome this effect, and by the postponement of maintenance and renewals the operators were able to keep on more or less effectively. The decrease in prices in 1921 has improved the situation, and as the British people seem to be able to pay high taxes without great difficulty, it is thought that the conditions in Great Britain are not and will not prove to be as serious in other countries.

In the United States, in spite of the late entry of the country into the war and in spite of more favorable financial conditions, the difficulties appear to have been even greater than in Great Britain. The same causes have increased expenses, but the systems are much more extensive, the cars are larger and heavier, and the expenses correspondingly higher. Moreover, the public was accustomed to a general unit fare of 5 cents, and any change in fares met with great opposition, particularly if toward the zone system. Nevertheless, fares have been increased on most roads and in some cases have gone as high as 10 cents. Some companies have discontinued service, some have become bankrupt, and the period of difficulty does not yet seem to be over for most of the companies.

In Italy the situation has become most critical, especially since the armistice, on account of labor troubles and the high cost of coal, which is furnished almost entirely from England. The government has intervened by legislation, the result being increased wages in favor of employees who were not usually underpaid, thus threatening the existence of many of the companies. The situation remains grave, and it can only be saved by the improvement of conditions legally imposed under exceptional war conditions.

It is difficult to obtain in France an exact knowledge of the tramway conditions in Germany and in the Central European states, on account of the crisis in the exchange of these countries.

As for the countries which remained neutral during the war, Holland, Switzerland and Scandinavia, if the condition of their transportation systems is not as bad as the others, it is certainly less favorable than in 1914.

Conditions in France

The accompanying table gives some statistics of a number of the principal systems in France outside of Paris. That city is omitted because during and after the war, the conditions there were special and were accompanied by a change in the franchise by which the authorities became responsible for deficits. Hence, comparisons can hardly be made with systems operating under the old form of franchise.

As shown in the first two columns of the table, traffic between 1913 and 1920 greatly increased in cities of an industrial character, while it has decreased in the commercial or agricultural centers, which attracted working population to a less extent, and whose population decreased during the war. This falling off in traffic from natural causes was intensified by successive increases in fare, made necessary by higher costs, and in some cases unprofitable service has been cut off.

Gross receipts have increased in a ratio which varies often between two and three, according to the importance of the system. At first, any increase in rates was strenuously opposed by the local authorities, but, since 1916, the law of Nov. 30, 1916, has simplified procedure in most cases and the Council of State has declared that the holder of a public franchise has the right to receive such returns as he had been reasonably able to expect when it was established from the moment when he finds himself deprived by circumstances impossible to foresee and the origin of which has resulted from a state of war.

This decision has been applied gradually in most jurisdictions and has saved from complete ruin a large number of enterprises. It has facilitated greatly the adjustment of fares to the extent made necessary by increased expenses, so that in a number of cities fares have now reached a limit which it is hardly possible to exceed in the circumstances.

Since 1921, the situation has been improving, due to the lower cost of materials. Some large systems, thanks to their higher fares, have been able to care for some deferred maintenance as well as pay fixed charges and some even show some surplus.

In general, however, the condition is not cheerful. Amortization of the past deficits and the cost of long accrued maintenance mean higher fixed charges in the future, while the high cost of money and the necessity of paying for renewals out of net income mean that for a company to have as stable a budget as before the war it should have an excess of receipts over operating expenses at least double that necessary in 1913. This result can be obtained in the near future only in exceptional cases. For the other properties it will be necessary either to increase the receipts or reduce the expenses, or obtain subsidies from the communities served. This last solution has been fairly popular in recent years among the city authorities because it offers a means of postponing difficulties, while ignoring the true cause.

There has thus come a series of purchases, with or without an operating lease to a private company, such as has taken place on the largest scale with the Parisian systems, and a number of municipalities have adopted the slogan "administration by those most con-

cerned." This policy, even when private operation is allowed to remain, has for its object the substitution of a system of joint control. When there is an excess of receipts, there is a division. When there is an excess of expenses, the city advances the necessary sum.

Conclusions

At present there are certain systems which have shown a vitality sufficient to offer some chance of continuing operation under the original form of franchise. But most companies favor the new plan, which assures an existence, although a mediocre one.

Developments along this line seem to call with the smaller properties for consolidations either along geographical lines or by classes of service. Under this plan the subsidies from the national government, the departments or states, or local communities can be obtained. As for urban tramways defraying the cost of construction, making payments to the cities for the use of franchises and paying dividends on their stock—that time has gone.

Chamber of Commerce to Hold Annual Meeting

Transportation will have a prominent place in discussions at the tenth annual meeting of the Chamber of Commerce of the United States to be held in Washington May 15 to 19. The general subject of the convention is announced as "European Conditions and their Effect on American Business."

Railroad questions will be dealt with in two group sessions, the first session having to do solely with domestic problems and the second with general transportation questions which have a bearing on foreign trade. The Railroad Group Session will be held on the afternoon of Tuesday, May 16. The general topic for consideration will be, "Experience under the Transportation Act, 1920," with especial reference to the rate-making provisions and the financial provisions of the act.

New York Electric Railway Association

AT A recent meeting of the executive committee of the New York Electric Railway Association it was decided to hold the fortieth annual meeting of the association at Hotel Champlain, Bluff Point, Lake Champlain, on Saturday, June 24.

Committees appointed at the executive committee meeting include the following: B. E. Tilton and W. O. Wood, committee on speakers; Carl H. Beck, chairman of the entertainment committee; H. B. Weatherwax and A. E. Reynolds, committee on hotel arrangements.

American Association News

Executive Committee Meets in Baltimore

John W. Colton to Be the New Editor of "Aera"—Past-Presidents' Badges for Affiliated Associations — National Relations Committee Busy — Next Meeting of the Committee to Be Held in Montreal on May 31

A MEETING of the executive committee of the American Association was held in the offices of the United Railways & Electric Company of Baltimore on Friday, April 28.

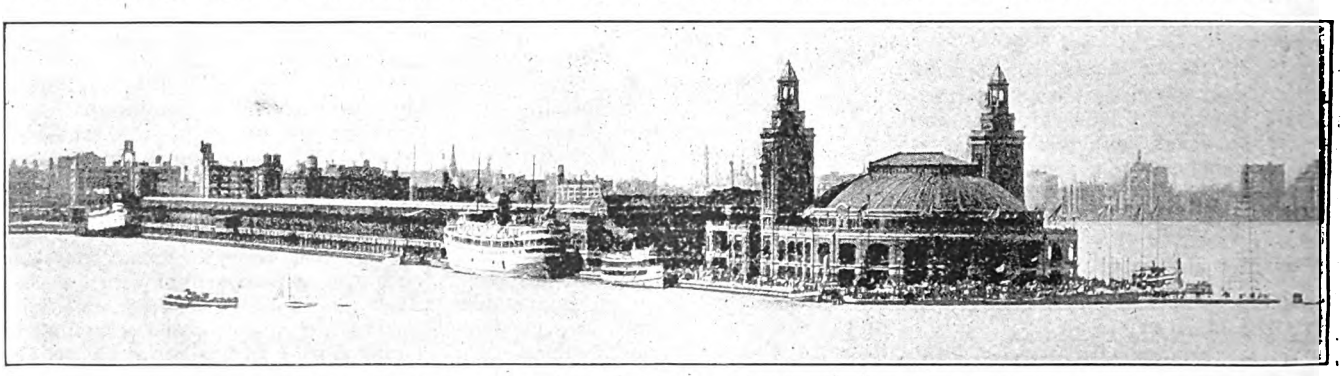
In his report for the committee on national relations, Mr. Henry told the committee at some length the situation regarding the Bacharach bill and the hearings which had been held on this bill. At most of the hearings so far conducted, the principal witnesses who have been heard have been those in favor of the passage of the bill, the last to appear being Mayor Hylan of New York. Recently the committee has been hearing from some of the state commissioners who have pointed out the danger of driving capital away from investment in public utilities in case this bill is passed. Mr. Henry also referred to the Interstate Commerce Commission's study of the question of power brakes, which, however, will probably not affect electric railways. The next hearing on this question will be held on May 17.

Mr. Henry also called attention to the fact that most electric railway companies seem not to comprehend the function or the availability of the committee on national relations in its service to individual companies. The Interstate Commerce Commission and other bodies require that various railway companies coming under their jurisdiction should maintain "representatives" in Washington. So far as Mr. Henry can ascertain, these representatives are necessary merely for the purpose of providing someone on whom papers and notices may be served and to this extent the committee on national relations of the association is available without charge to any member company of the association. The executive committee authorized Executive Secretary Welsh to call this fact to the attention of the members of the association.

Reporting for Mr. Emmons, chairman of the subjects and meetings committee, Mr. Palmer outlined the tentative program which the committee had prepared for the October convention in Chicago. The committee is not yet prepared to announce a definite program, of course, but its general plans are to devote the Tuesday session to the relation of the electric railway to the rest of the industrial life of a community and to its social development, and to questions of public relations and publicity. The Wednesday session, it is planned, will be devoted to a consideration of some problem from a national viewpoint by some nationally prominent speaker; there is planned a past-presidents' forum and possibly some discussion of trackless transportation. On Thursday the general subject will be finance and economics from several standpoints—the general financial and economic situation of the railways, fare systems, securities and customer ownership. Details of the program will be announced later.

The report of the publicity committee dealt largely with the work in connection with the co-operation of manufacturers, following the plans of the committee on this subject headed by Mr. Wickwire.

Secretary Welsh presented the report of the publications committee by Mr. Storrs, the chairman, who was unable to attend the meeting. The principal point in this report was that the com-



MUNICIPAL PIER IN CHICAGO, WHERE THE 1922 CONVENTION WILL BE HELD

Digitized by Google

mittee had, after a thorough canvass of the field, made arrangements with Mr. Colton to undertake the editorship of *Aera*. More extensive announcement of this appears elsewhere in this issue.

As recommended by a committee headed by Mr. Stevens of the finance committee, and having as its members the presidents of the four affiliated associations, the executive committee authorized the purchase of past-presidents' badges for all of the past-presidents of the affiliated associations. An acceptable design was offered by the committee and adopted by the executive committee. This design is to be common to all of the affiliated associations, and consists of the design of the pin of the association embossed on a pendant with the words "past-president" above the pin design and the name of the affiliated association below this. This design is a pendant from a single bar which carries the name of the past-president and the date of his incumbency in office. These badges will be of gold.

President Kimball of the Engineering Association reported progress of the engineers on activities in the various states on overhead specifications. Mr. Hecker, special engineer, is now following these various hearings and making a study of the situation in so far as it affects electric railways. It was pointed out in the discussion on this subject that the electric railway industry is not functioning as a unit on this subject, and that there should be more publicity to the fact that when hearings start in various states the association headquarters should be notified by local companies so that the facilities of the association headquarters may be placed at the disposal of the various companies in presenting their cases before commissions on this question.

The president was authorized to appoint a special committee to consider the question of drawing up a model law for the regulation of motor vehicles.

Accepting the invitation of Mr. Gaboury of Montreal, the executive committee decided to hold the May meeting in Montreal on Wednesday, May 31, the day preceding the convening of the Canadian Electric Railway Association at Quebec. (Details of the program of the convention will be found on page 755 of this issue of the ELECTRIC RAILWAY JOURNAL.

After the meeting adjourned the members of the committee were entertained by the officials of the Baltimore company at a lunch at the Country Club.

Highway Committee Forming

A COMMITTEE on cost of construction and maintenance of highways is being formed by the American Association and the personnel will be announced shortly.

This subject is considered important because it has an intimate relation with the transportation of passengers by motor and trolley bus and transportation of freight by motor trucks.

Claims Association Outlines Program

President Rice Points Out, in Communications to Association Members, the Need for Active Interest in Association Work

PRESIDENT CECIL G. RICE of the American Electric Railway Claims Association is conducting an active campaign to increase interest in the Chicago convention of that association and make the organization of greater value to the claims departments of the different companies.

On April 13 he addressed a letter to the claims directors of member companies in the American Electric Railway Association pointing out various salient facts regarding the annual cost of accidents in the United States and the amount of this expense on electric railway lines. This latter figure was given as $50,000,000. Mr. Rice also said that the percentage of these costs to the gross receipts for different companies varied from 2 per cent to 17 per cent. These differences, he declared, are not the result of luck or chance, so that the need for the exchange of experience such as is possible in the association is evident.

He declares that the successful claims director is keen, alert, well informed, friendly, sympathetic and above all a good business executive. The Claims Association convention offers him the one big opportunity to absorb the wholesome atmosphere of understanding in a clearing house of claims troubles and experiences. It is up to him to participate or to his company's superior official to direct his attendance and participation. The best interests of the company demand it.

In his second letter, sent out April 24, he solicited suggestions from claims members of the association as to (1) topics to be considered at the Chicago convention; (2) practice upon which experience data from other companies can be collected, analyzed and recorded; (3) suggestions for broader and new activities of the association, and (4) changes, additions or approval of past plans, procedure, policies and control. To aid in such suggestions he outlined the problem as follows:

Claims Department: (a) Prevention of accidents, (b) discouragement of claims, (3) investigation of accidents and of current and litigated claims, (d) adjustment of current and litigated claims, (e) clerical records.

Medical: (a) Examination of injured, (b) examination of claimants, (c) examination of litigants, (d) testimony at trial.

Legal: (a) Advice and opinions, (b) preparation of suit, (c) trial and defense.

Mr. Rice's second letter concludes as follows:

> If you have attended past conventions, what was done that you did not like? What would you like done? What would attract you to and most interest you at the convention? What could be done to make it easier for you to secure executive approval for attending the convention?
>
> This association belongs to the members. You are one of the members. Exercise your ownership. Whatever you write in confidence will be so held. If I can open the doors any wider tell me how. Meet me half way. I have started. Come on.

An outline of the plans for 1922, as prepared by him, is reproduced.

OUTLINE OF PLANS FOR AMERICAN ELECTRIC RAILWAY CLAIMS ASSOCIATION, 1922

1. Register accredited representatives to Claims Association by all member companies of the American Electric Railway Association.
2. Overcome dissatisfaction and satisfy complaints.
3. Increase interest of { active members / inactive members.
4. Interest { representatives of medical departments / representatives of legal departments } { associate activities / convention attendance.
5. Increase membership through associate members from non-member companies.
6. Learn the { association desires / claims problems } of all members.
7. Arrange { instructive / interesting / entertaining } convention program for { claims directors / legal representatives / medical representatives } on basis of greatest good to greatest number.
8. Make { statistical / experience / practice } surveys of matters requested.
9. Make office of direct service and clearing house for Claims Association members.
10. Convince higher officials of member companies of the benefit resulting from their claims director's { association activities / convention attention } { to company. / to claims director. and assistants. / to legal department. / to medical department.
11. Index subjects of past conventions and make them available for reference.
12. Develop accident prevention. Reduced claims cost will follow.
13. Strike at exorbitant contingent fees. They are the root of ambulance chasing, litigation, exorbitant verdicts and high claims cost.
14. Dignify and broaden the objects of the Claims Association.
15. Commence and continue preparation of a Claims Association code.
16. Analyze official experience during association year and recommend plans for future increased association efficiency.
17. Consider honor award for claims efficiency similar to "Rice Safety Award."
18. Co-operate with { affiliated associations. / National Safety Council. / American Society of Safety Engineers. / Association of Railway Claim Agents (steam roads). / International Claims Association (insurance). / National Electric Light Association. / American Gas Association.

Recent Happenings in Great Britain

Peace in Tramway Industry—Electrification Prospects—Glasgow Subway Sale Off

(From Our British News Representative)

SERIOUS labor disputes have broken out in the British engineering and shipbuilding trades, but there are prospects of continued peace in the tramway industry. It may be recalled at a previous meeting of the National Joint Council for the industry several questions as to conditions of labor remained unsettled. During March, however, the Council succeeded in coming to an agreement. With regard to hours of work, the average duty schedule will be forty-eight hours per week of six days. No duty will be less than forty-four hours nor more than fifty-two. As to spread time, each tramway authority will deal with the matter in conference with the local representatives of the trade union. With respect to the vexed question of a guaranteed forty-eight-hour week, it was agreed that all employees hitherto entitled to the guarantee in question will retain it provided that they present themselves for work at the appointed time each day.

Terms of Agreement Summarized

This is subject to the condition that in the event of a stoppage of a tramway service from causes beyond the control of the tramway authority the guaranteed week will be suspended and only the actual time worked will be paid for. In the event of a partial stoppage, the tramway authority will consult the local representatives of the trade union with a view to dividing the work equitably among the employees. With regard to new entrants into the service, who are not to have a guaranteed 48-hour week, their number must not exceed 10 per cent of the total employed, and they will have a guaranteed week of thirty-two hours. In the event of a spare man being called out, he will be paid a minimum of four hours for the first call and two hours for each succeeding call in the day. Eight days holiday per annum with pay were agreed to, as was also a stipulation that Christmas Day shall be worked when required, double pay to be given for the time actually worked, with a minimum of four hours. To meet the case of small undertakings, some of these provisions may be modified by local consent. The whole scheme was recommended to the constituent bodies for acceptance, and there is every prospect that it means a general settlement.

A month's strike of Newcastle tramway employees ended recently by the men giving in. They had the special privilege of a forty-four-hour week, and when the Town Council sought to change it to a forty-eight-hour week, so as to bring the time of work into conformity with that on other tramway undertakings, the employees struck.

During the latter part of March several brief announcements were made on behalf of the government in the House of Commons in regard to the application by the London underground electric railway companies for a state guarantee, under the trade facilities act passed last autumn, of principal and interest on a loan proposed to be raised by the companies for carrying out extensions and improvements. The first announcement was that the British Treasury had agreed to guarantee the loan, the underground companies having estimated that 15,000 to 20,000 men would be provided with work for from eighteen to twenty-four months on construction. The next intimation was that the Treasury guaranteed the principal and interest on £5,000,000 of debentures to be issued by the London Electric Railway and the City & South London Railway. The third installment of information, details being withheld as negotiations were not complete, was that the capital would be raised by a public issue of debentures.

In regard to the electrification of more of the suburban lines of the railways heading out of London to the south, the process seems likely to be expedited by an arrangement reached by the three companies concerned. These companies, the South Eastern & Chatham, the London, Brighton & South Coast and the London & South Western, are to be grouped into one company under the railways act, so that a general arrangement regarding electrification is desirable and indeed necessary. The South Eastern & Chatham electrification expenditures is estimated at £5,800,000; the first stage of the work will cover 210 miles of single track. The London, Brighton & South Coast Railways estimated for converting all its suburban lines is £10,000,000. More than 100 track-miles have already been electrified, and present projects point to 300 track-miles more.

Speeding Up at Underground Stations

As the result of an experiment extending over three months at Kilburn Park station on the London underground electric railways, the use of a booking apparatus called the passimeter is to be extended to eleven other stations on the underground system. Time-saving is the object in view, and this is of special importance during the morning and evening rush hours, which are more concentrated and, therefore, more overwhelming than ever before. The passimeter arrangement involves the use of three separate registering cyclometers, two of them automatic and one non-automatic. The first registers the dating and cancellation of each ticket, setting the passenger free to proceed through the passimeter, which is an elaboration of the ordinary turnstile. This operates another cyclometer which automatically records each individual's passage. With the third cyclometer the booking clerk registers the passage of season ticket holders. From the passimeter the passenger goes on to the station platform without any ticket examination at the customary barrier. The whole arrangement at Kilburn Park is worked in conjunction with an "automaticket" machine. By the pressure of a small plunger the booking clerk can issue any number of tickets up to five of any one denomination.

Quiet Station Chosen for Experiment

Kilburn Park station, where the experiment was carried out, is a comparatively quiet one, and was chosen for this reason. Some of those to which the scheme is being extended are among the busiest. The volume of traffic (inward) handled at Kilburn Park during the three months exceeded half a million passengers. The ticket on being presented to the passengers is instantly dated, examined and punched by the machine provided. By a careful study of the rate at which passengers are booked at an ordinary booking office window at underground stations, compared with Kilburn Park, it has been found that eleven passengers per minute are dealt with by the old style and thirteen in the case of the new style. What is perhaps of more importance than this 16 per cent saving in time is the further saving owing to there being no ticket examination barrier. The analysis shows that 70 per cent of passengers require change and that the major delay at booking offices is tnat of change giving. A machine has been designed and will be tried at Kilburn Park; in this a push button labeled with the requisite change will be operated by the booking clerk; the machine will instantly release the proper change onto a counter trough in front of the passenger.

Glasgow Subway Purchase Negotiations Off

The negotiations for the purchase of the Glasgow Subway by Glasgow Town Council have broken down because the price asked by the Subway Company was much in excess of what the corporation was willing to pay. The latter offered £300,000. It may be recalled that the subway is in the form of a circle about 6 miles in circumference and serves the central, southern, western and northern districts. The report of the subway company for 1921 showed a loss on working of £39,287, due to the excessive cost of coal, cables, and materials. At the annual meeting of the company it was mentioned that to convert the line to electric traction would cost £100,000. As a consequence of the failure to conclude the negotiations it was decided that the undertaking should close down on March 26.

Agreement Reached

New Orleans Council Approves Compromise Arrangement with Local Company

The compromise ordinance introduced by Commissioner Paul Maloney of the Department of Public Utilities in the New Orleans Railway & Light Company matter has been adopted by the Commission Council on motion of Commissioner of Finance Murphy. The vote of Mayor McShane was the only one recorded against ratification. Nothing now stands in the way of proceeding with the reorganization of the company but compliance with the rules of procedure which have already been outlined in these reports.

MALONEY STOOD FOR ACCEPTANCE

Among the principal provisions incorporated in the settlement ordinance are the following, very briefly summarized:

Valuation of the property, as of Dec. 31, 1920—$44,700,000, of which $25,000,000 is allocated to the railway department.

Rate of return to company on this valuation, and on any new money invested in the properties, 7½ per cent flat.

Actual disbursements to security holders limited to 6½ per cent.

A reserve fund of $300,000 to be created each year, either out of earnings or by issuance of new securities, subject to the approval of the Commission Council, half of which is for improvements to the property and half for the refunding of 4½ per cent bonds.

The outstanding obligations of the company of more than a year's extent at no time to exceed the rate base.

Holders of 4½ per cent bonds in return for yielding their preferred position to receive 25 per cent of the par value of their bonds and 75 per cent of the value in new securities.

Carfare to be reduced to 7 cents for a test period of a year, and gas to $1.30 as soon as the reorganization is effected, and the new rates maintained for a sufficient period to determine whether the property can be operated on that basis.

The city to hold a perpetual option on the property at the valuation as of Dec. 31, 1920, plus any additional investments.

The city to supervise all new securities issued.

Dividends on the common stock not to exceed 8 per cent a year cumulative or 9 per cent in any one year if necessary to effect the sale of stock at par for financing purposes.

Commissioner Maloney stood out stoutly for the acceptance of this plan. He pointed out that while the city had gained a victory over the state with respect to the power of the city over rates, this was only a theoretical advantage as in the last analysis the company could resort to the courts for relief from conditions which in its opinion might be intolerable to it. Thus while it was definitely settled by the State Supreme Court that the right to make rates adhered in the city, still in a suit brought in the federal court the city was restrained from interfering with the collection of an 8-cent fare or any other fare necessary to produce a fair rate of return upon a fair value of the property. Such an injunction was actually issued at the instance of a federal district judge. While the city appealed the case on the ground that the rate of fare in a franchise is an inviolable contract, the United States Court of Appeals affirmed the judgment of the district court.

In arguing on from these facts Mr. Maloney said in part:

From these decisions it appears that unless we effect a compromise we will be forced into court on the question purely and simply of a rate making body contesting the present charges that are now being levied by the utilities. This would mean evidence as to value of the property and what constitutes a fair rate of return on such valuation.

From recent decisions and the history of this particular matter, we cannot take encouragement, and I would submit that it is the serious duty of this Council to weigh carefully the question of compromising the disputes or continuing in court, because, if we permit ourselves to be parties to the litigation and the people of the city are given a decision that would force a settlement inferior in its allowance to a settlement that could be obtained by a compromise, the responsibility must fall upon the shoulders of this Council.

No matter what our desires may be to reduce the charges that the utilities are now assessing, we must fully appreciate that our powers are limited and our actions always subject to a review by the court.

In the settlement plan, we have obtained a great many concessions that would positively be lost in court proceedings, as the only matter the court could pass upon would be the value of the property and the rate of return and what would be fair charges to yield such a rate of return.

The details of the proceedings looking toward the lifting of the receivership will now be taken up. They are referred to elsewhere in this issue, as are also the general terms decided upon for the rearrangement of the capitalization of the company under the new agreement.

Maine Men Accept 10 per Cent Cut

Motormen and conductors of the Portland (Me.) Railroad and allied lines have voluntarily agreed to accept what amounts to practically a 10 per cent reduction in wages for the year beginning May 1, 1922, in order to enable the road to make up a deficit in its earnings.

The present wage scale is 60 cents an hour for the operators of one-man cars, and 55 cents an hour for conductors and motormen on two-men cars, and the average day covered by these employees is of the nine-hour variety. The cut for operators of one-man cars would therefore be from $5.40 to approximately $4.90, and for opertors of two-men cars from approximately $5 to $4.50 a day.

During the year 1921 the deficit in the earnings of the Cumberland County Power & Light Company, which controls the Portland Railroad, was $63,000, a far smaller deficit than that which appeared on the books in preceding years.

Another M. O. Experiment

Ohio City of 25,000 Will Run the Local Railway System After July 1—$100,000 for Improvements

Ashtabula, Ohio, is the latest city to vote in favor of municipal ownership of its street car lines. At an election held there on April 24 the voters approved the purchase of the property of the Ashtabula Rapid Transit Company for the price of $150,000. Fewer than 3,500 votes were cast. The plan was approved by a majority of 856. Ashtabula is the first city in Ohio to own and operate its own street car line. Transfer of the property is expected to take place by July 1.

City officials say that they plan to spend at least $100,000 on new equipment and improvement of the road bed as their first effort to give better service under municipal ownership. The purchase of at least six one-man safety cars, so as to permit 10- or 12-minute service, is contemplated.

Ashtabula street car troubles date back to the '80s, when the old horse-car line of John N. Stewart was put out of business by Councilmen and city officials who, during the night, literally tore the rails from the streets.

Before the World War, the Ashtabula Rapid Transit Company was able to give reasonably good service at a 5-cent fare. At that time the line represented an investment of about $300,000. When the war came and prices soared, the railway found it impossible to give adequate service at a 5-cent fare. A 7-cent fare was asked by the company, but was rejected by the City Council, which did, however, grant a 6-cent rate. The people failed to approve this increase at a referendum election.

The company continued operation, but the high costs of labor and materials hurt operation. Then the company went into the hands of Charles Currie and A. R. Raymer, Pittsburg, as receivers. Backed by a court order, the receivers were able to get the fare raised to 8 cents.

This was followed by agitation for municipal ownership. Arrangements were made to sell the property to the city for $296,000. This offer was accepted by the city and ratified by the people, but owing to the impossibility of finding a market for the bonds, the deal never went through. Last summer agitation for municipal ownership was again renewed. The receivers then offered to sell the property for $197,000, but the voters rejected this proposition. During the past winter the stockholders in the defunct railway started another agitation with the result that the property was offered to the people for $150,000. This is the offer that has now been accepted.

Pittsburgh Scale to Continue Another Year

The last differences on wages and working conditions between the receivers of the Pittsburgh Railways and its employees were reported settled on May 2 at a conference of the receivers and the union wage scale committee. Earlier in the day, after a second meeting of the employees to ballot on wage proposition, it was announced the men had voted almost unanimously to continue for another year at their present wages.

These are: 54 cents an hour for the first six months' service, 58 cents an hour for second six months and 60 cents an hour after the first year. The average day is nine hours.

A few slight changes in working conditions, requested by the men, will be made in the new agreement, it was announced.

The total vote was. For compromise on present wage, 2,136; for arbitration of dispute, 8; for accepting proposed wage cut, 0.

Offer Accepted—Strike Averted

By accepting the company's wage offer railway employees of the Dominion Power & Transmission Company, Hamilton, Ont., have averted a strike which threatened to leave Hamilton without car service and throw 25,000 men out of work. Men employed on the suburban radial lines and the steam and electrical engineers in the power houses voted against acceptance. The railway vote was in the majority which prevailed.

Acceptance of the company's offer means that the men have consented to take considerably less than was recommended for them by the majority award of the Board of Conciliation. About two months ago the company enforced a general wage reduction averaging 12½ per cent. The majority award of the Board of Conciliation provided for an average reduction of about 4 per cent. Acceptance of the company's offer provides for the employees of the power houses taking wage reductions averaging 6 per cent, and the crews of the suburban radial lines and the street railwaymen taking a cut averaging 8 per cent.

Lew Shank Advocates Municipal Ownership

Mayor Lew Shank of Indianapolis has come out as an advocate of the purchase by the city of Indianapolis of the principal utility companies' properties in the city, among them the Indianapolis Street Railway. He proposes to take personal charge of a fight before the next session of the Legislature for the enactment of a constitutional amendment that will permit the city's bonded indebtedness limit to be increased from 2 per cent of the tax valuation to 10 per cent for the specific purpose of bringing about municipal ownership and operation of the utility companies' plants.

While it came as a surprise, the announcement was not entirely unexpected, for the Mayor has been in a continuous squabble with the various utilities and the Public Service Commission since he took office the first of this year. About six weeks ago, he lead an "army" to the statehouse where he harangued the Public Service Commission for permitting an electric power merger. At that time he advocated the repeal of the law creating the Public Service Commission.

Reorganized Company Secures New Operating Rights

A new franchise for the Lafayette (Ind.) Street Railway, Inc., has been granted by the city of Lafayette, West Lafayette and Tippecanoe County. The company has ordered new equipment with which to rehabilitate the entire system. The new city franchise authorizes several changes in routes, the curtailment of several non-productive lines and the right to run a track on Eleventh Street to connect with the site of the carhouse where a new traction terminal is to be built. A new carhouse will be built for the city lines on a site formerly owned by the Ft. Wayne traction line. The county franchise permits the new company to operate over the main street bridge across the Wabash River without paying a fee. The old company paid $5,000 a year for the privilege. The franchise granted by West Lafayette provides for new routes, double tracking to improve service to Purdue University and abandonment of the loop that encircles the northern portion of the town. The equipment ordered includes fifteen one-man cars. New rails and ties also have been ordered.

New Pension System in Effect

A new system of pensioning employees in the service of the United Railways & Electric Company, Baltimore, Md., went into effect on April 1. Under the new arrangement terms of service rather than earnings of the men will be the controlling factor in allotting pensions. The plan also provides a minimum monthly payment and the result of this is to increase the payments that have heretofore been made to men who drew less than $30 a month. The men now receiving less than $30 a month will be paid $30 a month and those receiving more on the present basis than will be allowed under the new rule and regulation will continue to receive the present rate of pension.

Trolley Topics for April explains the plan in detail. It says:

> Those in continuous service twenty years and less than twenty-five years—$30 per month.
>
> Those in continuous service twenty-five years and less than forty-five years—$30 per month for twenty-five years' service and an additional dollar per month for each year of continuous service above twenty-five years.
>
> Those in continuous service forty-five years or more—$50 per month.

The plan is beneficial to all, especially honor roll men and prospects for that distinction.

New Franchise Agitated for Fort Wayne

Until some reasonable agreement is reached in the matter of rates the Indiana Service Corporation will not sign a new franchise with the city of Fort Wayne. This is the decision of President Robert M. Feustel of the company.

The city through Mayor Hosey has been endeavoring to get the company to agree to a new franchise. At present the company is operating under an indeterminate permit from the Indiana Public Service Commission, having surrendered its franchise some time ag

The latest attitude of the city is that before it grants permission to the company to double track its line on Pontiac Street the new franchise must be signed.

As the company understands the proposal from the city it is that the Indiana Service Corporation shall agree to accept the old 1902 franchise in case that any action of the Legislature or the courts repeals or annuls the public utility commission law. Under the terms of that ordinance the company was required to operate at a 5-cent cash fare and sell six tickets for a quarter.

In replying to the Mayor Mr. Feustel said:

> You know, of course, that with present wages and present cost of materials there is no possibility of giving railway service at that fare. No long term franchises have been written in any city for the past twelve years at least, where a city has agreed to accept a definite fare over a long period of years. The impossibility of fixing a definite selling price with changing costs is self-evident and no one contends for such an arrangement in these modern times.
>
> We are perfectly willing to continue to operate under the old 1902 franchise except in the matter of fares and for that item we are willing to make any reasonable arrangement which will fix the fare so that operating expenses and taxes and a fair return on the actual money invested is provided for in any rate of fare that is suggested. Less than this amount no court would allow and it merely means an arrangement whereby we agree how this fair return should be based.
>
> We are attempting to draw a paragraph to cover the method of determining the rate of fare and will submit this matter to you as promptly as possible.
>
> Early action on the franchises before the board of works is very important if the Fort Wayne railway patrons are to be adequately served.

Mr. Feustel declared that the cost of double tracking Pontiac Street the full length of the street would be at least $100,000.

Railway Remains Firm

Officials of the Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio, have made formal answer to the request of the union for the appointment of a board of five arbitrators to settle wage differences. The letter states that the company will not deal with the men as an organization and reiterates the gist of the communication of March 27 addressed to each employee. This letter stated that either individually or collectively the company would confer with the men on the wage contract, expiring on May 1, but that it would not deal with the employees through the medium of any labor union.

New Grant Almost Ready

Finishing Touches Being Put to New Thirty-Year Franchise for Grand Rapids Railway

Members of the City Commission and officers of the Grand Rapids (Mich.) Railway are arranging for a meeting to be held soon, at which the complete text of the new railway franchise draft will be discussed.

Since the draft was announced as completed by Stuart E. Knappen, attorney for the railway, and City Attorney Taggart, it is reported that to the clause providing for an 8 per cent return on the value of the company's property there has been added another clause which provides for a bonus for the company's employees. This bonus is to be pro-rated according to the employee's wages or salaries, but does not include the administrative officers. A sliding scale of fares is proposed on the service-at-cost plan, with an equalization account starting at $200,000.

OFFICIAL COMMENTS ON BONUS PLAN

The bonus clause provides:

The grantee's initial rate of return on the value of its property, as determined under section 12 of this ordinance, shall be 8 per cent per annum. The grantee's rate of return shall be decreased one-fourth of 1 per cent whenever the rate of fare shall be increased one step as hereinafter in this section defined, when the cash of ticket fare in effect shall be 5 cents or less, the employees of the company shall receive one-fourth of 1 per cent on the value of the company's property for rate making purposes as a bonus, to be prorated according to their wages or salaries, but not including those of administrative officers and the return of the company shall also be increased one-fourth of 1 per cent, providing that the increase to said employees shall be first made before any increased return to the company.

Naturally this provision has provoked some comment. Caution is urged, however, in passing judgment on it. Thus L. J. De Lamarter, vice-president and general manager of the company, is quoted as follows:

The bonus plan is a subject of such importance that snap judgment on it could not and should not be made. The railway management has been for some time considering different plans for reward to employees for efficient service, and a bonus plan would be one of the natural plans to consider, although there might be certain other plans which we have been working on that would possibly be far more satisfactory to our employees than a bonus plan, and the city and company will doubtless be able to work out something that will prove satisfactory to all concerned. I can not discuss the latest plan proposed until after I see and analyze it.

The franchise draft also includes a sliding scale of fares depending on the earnings of the company. The initial fare is to be 10 cents cash or seven tickets for 50 cents, but the fare may vary from a low of 5 cents cash with eleven tickets for 50 cents to 10 cents cash and five tickets for 50 cents.

REPORTS TO BE SUBMITTED

As has been the custom since the first increase of fares in December, 1918, the company is to furnish the city with a monthly report. City officials are to have access to the books of the company to confirm such reports. A budget for the following year to be approved by the city must also be furnished by the company and construction work and expenditures of the company must be under the supervision of city officials.

The city reserves an option to purchase the company's property at the end of fifteen years, or at the end of any five-year period. The railway must pave between the tracks and for 12 in. on each side of them.

The franchise is for a period of thirty years.

Included in the new franchise is a clause giving the city the right to order extensions of service, and public hearings shall be given on all such cases. In case the company is dissatisfied with such an order, it can appeal to a board of arbitration.

Wage Reduction of Five per Cent Announced

A new wage scale affecting trainmen of the Cape Breton Electric Company, Sydney, N. S., went into effect on April 1. The schedule in cents per hour is as follows:

First six months	35
Second six months	36
Second year	38
Third and fourth year	40
Fifth and sixth year	42
Seventh and thereafter	44

This makes two wage cuts which have been made by the company, the first one having been put into effect on May 1, 1921, at which time all employees both daily men, monthly men and officials were cut approximately 8 to 10 per cent.

Prior to May 1, 1921 wages of trainmen were as follows:

First six months	40
Second six months	42
Second year	44
Third and fourth year	46
Fifth and sixth year	48
Seventh and after	50

In submitting the bulletin to the trainmen announcing the wage reduction, C. C. Curtis, manager of the property, said that riding on the cars had fallen off tremendously and that there seemed no immediate prospect of any great improvement. He said that for the whole company including all departments, and in the two months of January and February, 1922, the company failed by $29,825 to pay interest charges on the bonded indebtedness. He explained further that the present reduction amounted to only 2 cents an hour which "seems very mild as compared with some others which have been made in other industries."

Men Granted Board of Conciliation

The Department of Labor, Ottawa, has notified the London (Ont.) Street Railway and its employees to name their representatives for the Board of Conciliation which will take under advisement the matter of wages. The union had asked for a board of conciliation to settle the dispute arising from the 3-cent reduction effective on March 1. Reference was made to the union's application in the ELECTRIC RAILWAY JOURNAL, issue of March 25.

Wage Issue Unchanged

The question of a new wage and working agreement for the employees of the New York State Railways in Schenectady, Utica, Syracuse and Rochester continues unchanged, with both sides sparring for an opening. By an overwhelming vote the men in Rochester, Syracuse and Utica on April 26 rejected the proposed wage agreement of the management because of changes in working conditions which they say would have been detrimental to them. President James F. Hamilton and officials of the railway insist that separate agreements and conditions shall cover the different sections involved.

In Schenectady the union on April 29 by a vote of 166 to 84 decided to retain as president Walter Walker and as business agent Michael Ward, in the face of the company's ultimatum that no delegation of workers would be received which included these two men.

A conference between Mr. Hamilton and members of the Joint Conference Board of the Amalgamated Association representing Rochester, Syracuse and Utica, headed by John H. Reardon, member of the international executive board of the union, was attempted in Rochester on May 1, but was indefinitely adjourned after Mr. Hamilton had reiterated his unwillingness to meet a committee including Walker and Ward of the Schenectady division of the union.

At the opening of the conference Mr. Hamilton was asked by Mr. Reardon if he would consent to include a committee from Schenectady in the conference, the request including a statement that the Schenectady division recently had given its president and business agent a vote of confidence. Mr. Hamilton replied he was willing to meet any committee from the Schenectady division that did not include Walker and Ward, but he preferred to meet such a committee in Schenectady. He also expressed the desire that negotiations for wages and working conditions in Schenectady be conducted separately from those concerning Rochester, Syracuse and Utica.

Wage Agreement Renewed

By mutual consent of the public trustees of the Eastern Massachusetts Street Railway, Boston, Mass., and the union composed of the road's employees, the wage and working agreement in force, founded upon an award of the State Board of Arbitration and Conciliation in 1921 and which would have expired on May 1, has been extended for another year.

The basic wages of the operators are 49 cents an hour for the first three months' service; 52 cents for the next nine months and 54½ cents thereafter, with 5 cents an hour additional or a maximum of 59½ cents an hour for one-man car operation. As more than 95 per cent of the cars are one-man type, nearly all operators receive the maximum of 59½ cents an hour.

Digitized by Google

Wages Reduced Two Cents an Hour

A reduction is ordered of 2 cents an hour in the scale set forth in Section 8 of the agreement dated Aug. 16, 1921, between J. H. McClure, receiver of the Indiana, Columbus & Eastern Traction Company and the Amalgamated Association, and in Section 8 of the agreement of Aug. 16, 1921, between P. A. Berry, receiver of the Columbus, Newark & Zanesville Electric Railway, and the Amalgamated Association. The wage scale thus fixed is made effective as of Feb. 15, 1922, and continues in effect for a period of six months from and after Feb. 15, 1922, in accordance with the agreement of Feb. 4, 1922, called an arbitration agreement entered into between the receivers, respectively, and the divisions, respectively, previously mentioned. The wage scale (in cents per hour) fixed by this award is as follows:

Interurban Lines	
First three months	36
Next nine months	41
Second year	47
Freight brakemen	34

One-man car operators will receive 3 cents an hour additional to the base rate.

City Lines	
First three months	34
Next nine months	39
Second year	44

One-man car operators will receive 3 cents an hour additional to the base rate.

The arbiters in the dispute were C. W. Rich, Springfield, representing the trainmen; S. D. Hutchins, Columbus, representing the company, and Prof. George Rightmire of Ohio State University, Columbus, as umpire. Mr. Rich dissented from the finding. Both companies were represented at the hearing by J. H. McClure, receiver Indiana, Columbus & Eastern Traction Company.

The decision settles a controversy of more than two months standing as both sides had previously agreed to stand by the board's decision. The old wage scale expired on Feb. 15, at which time the company proposed to reduce wages 4 cents an hour. This scale was rejected, but, pending arbitration the men agreed to accept the following scale (cents per hour), the award of the board to be retroactive to Feb. 16:

	City	Interurban
First three months	32	34
Next nine months	37	39
Second year	42	45

The arbitration was on wages only, the wage agreement having expired on Feb. 15, 1922. The scale in cents per hour up to that time had been:

	City	Interurban
First three months	36	38
Next nine months	41	43
Second year	46	49

Certain Franchise Provision Null and Void

Certain provisions of the new Fresno franchise conflict with powers conferred on the California State Railroad Commission relating to the fixing of rates and are null and void, according to a statement of Chester H. Rowell, a member of the commission, who informed representatives of the city of Fresno and the Fresno Traction Company on April 21. Application was made by the traction company to abandon its present franchises and substitute the resettlement franchise. The franchise which the city has granted is known as the cost of service type and provides for an annual adjustment of fares which shall be allowed on "capital value." It also provides that the traction company shall be permitted to earn 8 per cent.

Commission Approves of Changes

The California Railroad Commission recently granted five petitions by the San José & Peninsular Railroads, San José, Cal., including abandonment of franchises, suspension of operation and a re-routing application. In its statement the commission said that the continuation of branch lines where such a great disparity exists between the operating revenues and the cost of conducting such operation results in an undue burden being placed on users of the transportation system and militates against the company's ability to serve.

Offer Rejected

Employees of the Syracuse & Suburban Railroad, Syracuse, N. Y., recently voted to reject the wage scale of 42 cents an hour offered by the company. The present scale is 45 cents and the men had asked for an increase to 60 cents. The company originally asked for a cut to 30 cents an hour, but this was later modified to 35 cents and then to 40 cents. At a recent conference between the company and union officers the company offered 42 cents.

Compensation for Joint Use of Track Being Determined

The Wisconsin Railroad Commission has been holding hearings on the petition of the Chicago & Milwaukee Electric Railway and the Milwaukee Northern Railway, both operating city lines in Milwaukee, Wis., to determine a fair basis of compensation for the use of the tracks owned by these companies on Wells Street in Milwaukee, Wis., and jointly used with them by the Milwaukee Electric Railway & Light Company. The commission some months ago, as a result of a petition by the city of Milwaukee, ordered the joint use of these tracks in order to relieve alleged traffic congestion on Grand Avenue, the principal business thoroughfare of Milwaukee which parallels Wells Street. The commission's order provided for a basis of compensation for the joint use of the track in question, but permitted any interested party to request a rehearing on the question of compensation. Such a rehearing was requested by the owner companies and the subject is being further investigated by the commission and hearings in the matter held.

News Notes

Wages Cut in Salt Lake.—An agreement has been reached by which the trainmen in the employ of the Utah Light & Traction Company, Salt Lake City, Utah, will accept a cut from 50 cents an hour to 47 cents for first-year men and a cut from 57 cents to 54 cents an hour for those longer in service. Under terms of the agreement, the wage schedule is to be further reduced on Nov. 1 provided it is shown there has been no increased cost of living as indicated by the Bureau of Labor statistics.

Benefit Association Out of Debt.—Membership in the Employees Mutual Benefit Association of the Twin City Rapid Transit Line, Twin Cities, Minn., is now 2,638, as announced in the report as of April 27, 1922. Claims for the period from February, 1921, to February, 1922, totaled $1,862. President Horace Lowry of the company said that although during the first year of the association it was necessary to borrow $10,000 from the company, subsequent adjustment of dues has put the association out of debt.

Will Probably Retain Present Scale.—It is believed that negotiations now being carried on between the management and employees of the Buffalo & Lake Erie Traction Company, Erie, Pa., will probably result in a continuation of the present wage scale of 42, 46 and 50 cents, the agreement for which terminated on April 30. It is understood that employees have made no new demands for the coming year nor has the company suggested any cut in the wages. The company has, however, offered to pay operators of the new "one-man" cars 5 cents more an hour than is being given operators of the old type cars.

Wage Agreement Renewed in Akron.—Four railway unions on the property of the Northern Ohio Traction & Light Company, Akron, Ohio, have voted to accept the company's offer of the same rate of wages paid in 1921. The new contract became effective May 1. The rates provide that city platform men in Akron, Canton and Massillon are to continue receiving 43, 45 and 48 cents an hour, based upon the length of service. The company's interurban platform men will continue to receive 48, 50 and 53 cents an hour for the next twelve months. A year ago the men, after refusing to take a 15-cent hourly wage cut, tied up the company's lines with a strike. After being out a week the men finally agreed to submit the question to arbitration. The arbiters reduced wages 17 cents an hour, 2 cents below the company's offer. This year there was no controversy whatever over the matter of the wage scale.

Financial and Corporate

Lifting of Receivership Likely

Security Holders of New Orleans Company Will Move to Reorganize Under Agreement with City

Unless some event now unforeseen intervenes a bill to foreclose the New Orleans Railway & Light Company's properties and sell them will be filed with the court before June 1. This will be the first real step toward the reorganization of the company and the discharge of the receivers under the plan of settlement with the city to which reference is made elsewhere in this issue. Under the terms of that agreement six months is allowed the company in which to perfect the reorganization arrangements.

The proceedings in foreclosure will be brought in behalf of the holders of the 4½ per cent bonds of the company. In this proceeding the New York Trust Company, trustee under the indenture securing the bonds, will act as the principal. The mechanics of this procedure will include the presentation of the findings of the special master, the drawing up of his report, the confirmation of that report by the court and finally the promulgation of the order of sale. Thirty days will then intervene in which the sale of the property will be advertised, after which the bondholders will bid it in. After confirmation of the sale the new company will step in and the receivers will be discharged.

As now proposed under the terms of the agreement of the company with the city the following disposition will be made of the existing outstanding securities of the company:

(a) Outstanding underlying bonds to remain undisturbed.

(b) Present outstanding 4½ per cent general mortgage bonds, due July 1, 1935 (for subordination of their lien so as to provide for future betterments and improvements and for necessary refunding operations through a new first and refunding open mortgage bond issue), shall be exchanged for 25 per cent in cash and the remaining 75 per cent in new general lien 4½ per cent bonds, due July 1, 1935, in the form of a closed mortgage. The said new 4½ per cent mortgage shall rank immediately after, and be subordinated to the said new first and refunding open mortgage.

(c) The present outstanding refunding and general lien 5 per cent bonds, due Nov. 1, 1949, with defaulted interest thereon, to be refunded by $5,129,000 income bonds, due Nov. 1, 1949, bearing 6 per cent per annum interest (adjusted for defaulted interest subsequent to June 1, 1922).

(d) The present outstanding defaulted 7 per cent gold notes and defaulted interest thereon, to be refunded by $3,955,000 preferred 7 per cent cumulative (adjusted for defaulted interest subsequent to June 1, 1922).

(e) The balance (after the issuance of securities to provide for receiver's certificates and the expenses of the receivership) up to the amount of the allowable rate base, at the date of reorganization, shall be common stock issued to represent the equity in the property, now represented by stock.

(f) Said reorganization into said new company to be accomplished at the earliest possible date and within six months from the date of the passage thereof by the council, subject to legal delays, beyond control; provided, however, that if said reorganization shall not be accomplished within nine months from said date, then the commission council reserves the right to abrogate this arrangement.

Additional important features of the plan provide for virtual local control of the company and for future financing through the sale of common stock. Before any disbursements may be made out of earnings or surplus to securities junior to the 4½ per cent bonds, a fund of $200,000 must be created, half of which must be invested in improvements and the other half used to retire 4½ per cent bonds. Before any payments are made on the preferred stock an additional fund of $100,000 is to be set up to be employed after the manner of the $200,000 fund. The dividends on the common stock must not exceed 8 per cent, but can be made as much as 9 per cent in case that rate is necessary to secure the sale of such stock at par. In no event, however, are the dividends on this stock to exceed 9 per cent. Under the plan for the reorganization of the American Cities Company, which formerly controlled the local New Orleans Company, the latter will be excluded from participation in the reorganization of the American Cities Company.

The New Orleans *Item* has worked out the estimated increase in the value of the company's securities as a result of the reorganization. This is shown in the accompanying table.

The settlement agreement fixes the value of the properties at $44,700,000 as of Dec. 31, 1920, made up of $25,000,000 for the railway lines, $11,048,000 for the electric properties and $8,652,000 for the gas properties.

THEORETICAL INCREASE IN VALUE OF SECURITIES OF NEW ORLEANS RAILWAY & LIGHT COMPANY UNDER REORGANIZATION

Pre-organization Value			Reorganization Value	
Amount of Issue	Security	Market Value	New Selling Price	New Market Value
$11,521,000	Underlying bonds, sold at average price of	$9,792,850	About 95	$10,944,950
17,500,000	Gen. Mtg. 4½ per cent bonds at 50	8,750,000	About 70	12,250,000
6,117,000	Series "A" 5 per cent junior bonds, at 35	2,140,950	About 65	3,976,050
3,955,000	7 per cent gold notes at about 20	791,000	About 60	2,373,000
	Total value bonded debt	$21,474,800	Total new value bonded debt	$29,544,000
Stock			Stock	
$10,000,000	Preferred stock at about 10	1,000,000	New selling price, .50, for $6,000,000 of all common and preferred stock in new company	3,000,000
20,000,000	Common stock at no value			
	Total value stock	$1,000,000		
	Total value of bonds and stock	$22,474,800		32,544,000 22,474,800
	Value added to total securities by reorganization			$10,069,200

Reorganization Plan Being Perfected

If the plans agreed upon by the bondholders of the South Carolina Light, Power & Railways Company, Spartanburg, S. C., which has been in the hands of a receiver for over a year, are worked out the local company there will be succeeded by a new company to be known as the South Carolina Gas & Electric Company, and the date when the new company will begin functioning will probably be July 1 of this year.

Counsel for the bondholders of the South Carolina Light, Power & Railways Company appeared before Judge H. H. Watkins, of the Federal Court in Anderson recently, and in a conference submitted the details of the proposed reorganization to him. While the Federal court has no jurisdiction at this stage of the proceedings, the courtesy of a full hearing was accorded counsel for the bondholders.

Under the foreclosure proceedings the new company will take title to the assets of the present company; it will issue 6 per cent bonds to take care of the outstanding 5 per cent bonds, and general mortgage bonds to supplant the present secured notes. Secured creditors are to be given first mortgage bonds and the unsecured creditors will be taken care of by notes. The power users under contract will be protected by the new company assuming the contracts of the old company.

$16,019,398 Fixed as Value of Power Properties

The light and power property of the Virginia Railway & Power Company, Richmond, Va., is valued at $16,019,398, according to an order entered on April 13 by the State Corporation Commission. Again the commission declined the reproduction theory as a basis for the valuation.

The new valuation was made by the commission following a rehearing from a decision returned in March, 1921, with which the company showed dissatisfaction. As a net result, the sum of $1,400,000 is added to the figures arrived at in the former case, which was of property as of June 30, 1920. The additions represent new property added since that date and certain waterpower rights which the company had failed to include in its claims in the former case. No rates for electric service are involved in the valuation.

Electric railway properties are not included in the valuation figures. The Richmond-Petersburg interurban line, which was valued separately last year by the commission, also is not included.

Surplus in San Francisco

William Von Phul, president of the Market Street Railway, San Francisco, Cal., has submitted the report of the company's operations for the period from April 1 to Dec. 31, 1921, the former being the date when the company assumed operation of the property heretofore conducted by the United Railroads. Mr. Von Phul stated that during the period the properties were well maintained and that the present physical condition was good.

Total operating revenues for the nine months amounted to $7,089,944 and total expenses were $5,768,794. The statement shows net earnings of $1,321,151, a gross income of $1,439,465 and a net profit for the period amounting to $487,521. The balance sheet as of Dec. 31 shows total assets of $48,696,411, of which $604,130 is represented by cash and $156,593 by investments in securities. The total number of passengers carried was 188,503,830, of which 141,869,551 were revenue passengers, 46,169,808 free transfer passengers and 464,471 free passes.

Quebec Property Reports a Surplus

The Quebec (Que.) Railway, Light, Heat & Power Company has reported gross earnings from operation for the eighteen months ended Dec. 31, 1921, of $4,139,320. Of this amount $2,757,836 was for the period of twelve months ended Dec. 31. Expenses for eighteen months were $3,104,840 of which $2,074,029 was for a twelve-months' period.

Net earnings totaled $1,034,480, of which $683,807 was for the twelve months ended Dec. 31. The net surplus for the eighteen months' period was $101,708 and for the twelve months the net surplus was $87,513. The corresponding period of twelve months ending Dec. 31, 1920 showed a deficit of $33,172 so that an improvement for 1921 over 1920 is noted in the sum of $120,684. The balance at the credit of surplus account on June 30, 1920, was $582,705. After adding the surplus for the eighteen months' period ending Dec. 31, 1921, there remained on the latter date a surplus of $684,413.

Elevated Lines to Consolidate

Directors of the subsidiaries of the Chicago (Ill.) Elevated Railways have approved the proposed consolidation plan and if it is sanctioned by the Illinois Commerce Commission, a special meeting of the stockholders will be called for July 11 to ratify same.

More than $2,000,000 will be expended for new equipment and other improvements necessary to operation of longer trains. The Oak Park Elevated. which has been in receiver's hands since 1911, is to be sold and become part of the new system.

The valuation placed on the properties by a former utilities commission in 1919 was $86 250,000. The value now is $86,682,900, not including $711,204 for property not used in railroading. The new board of directors will consist of Samuel Insull, Britton I. Budd, John H. Gulick, R. Floyd Clinch, Chicago, and S. A. Russell, New York.

Transportation Industry Growing

Has Doubled in Size During Last Ten Years—Ten Essentials for Future Growth Laid Down

With a total investment of approximately $50,000,000,000, the transportation industry of the United States ranks second to agriculture and ahead of manufactures, J. Rowland Bibbins, manager of the department of transportation and communication of the Chamber of Commerce of the United States, declared before the National Construction Conference held in Chicago.

"This enormous figure," he said, "covers only the actual operating plant for rail, ocean, highway, electric railway and waterway transport, and does not include factories producing the equipment and materials of construction.

"The industry has nearly doubled in size in the last ten years, largely due to the tremendous expansion of motor transport and shipping. Rough estimates for the future indicate that during the next twenty years, more capital probably will be required for new developments than our present national debt, which is about $25,000,000,000, thus bringing the total transport investment up to at least $75,000,000,000. This amounts to $580 per capita, of $1,450 for every worker gainfully employed in this country.

Ten essentials of transportation were given by Mr. Bibbins as shown in the following:

1. Transportation involves fundamentally three elements—time, cost and security of transit.
2. It is a problem of movement from producer to ultimate consumer, involving in every case collection, trans-shipment and delivery, which are some times more important than the main haul.
3. Cost analysis is more needed than ever before, particularly the cost of rail-to-job and vice versa.
4. Utilization of local materials and the most efficient form of local handling and movement, need most careful study.
5. Important progress is being made under great handicaps in new transport methods and adaptations, with a broader perspective and more co-operative effort.
6. Transportation is a utility essential to our national economic life and prosperity. If regulated, it must be conserved.
7. Stability of investment, operations, and costs are essential to adequacy of service and stability in business generally. If restricted in earning power continuous development can only come through sustained credit.
8. National efficiency demands a minimum transport investment in various agencies that will permit the most economic location of industries, with reference to raw materials, labor and markets.
9. The rate structure is a most potent form of control over the settlement and industrial life of the nation. It is essentially a national problem.
10. The national chamber can function best in conserving and aiding in developing a national transport system with its several agencies. The construction industry can function helpfully by close attention to its over-all cost distribution and to various new methods and adaptations.

Smaller Net Earnings for Northern Ohio Traction

The Northern Ohio Traction & Light Company, Akron, Ohio, in 1921 carried 47,799,437 passengers on its Akron, Canton and Massillon city railway lines, and 16,820,442 passengers on its interurban lines extending from Cleveland to Urichsville. These facts are contained in the company's annual report submitted to stockholders and announced on April 28.

In 1920 the company carried 68,903,885 passengers on its city systems and 20,876,115 passengers on its interurban cars.

The company's power and light service shows an increase in consumers from 38,438 in 1920 to 40,103 last year, although the total sales in kilowatt hours were lower, being only 102,681,834 last year as compared to 148,081 253 in 1920.

Comparative figures on the Northern Ohio Traction earnings for the last three years on its railway department show $5,376,818 in 1921; $7,280,396 in 1920, and $6,133,442 in 1919, and in its electric department of $3,214,476 in 1921; $3,629,234 in 1920, and $3,094,397 in 1919.

Operating expenses and taxes in 1921 were $6,485,951 as compared to $8,530,648 in 1920 and $6,678,125 in 1919.

Net balances to profit after deduction of interest charges and dividend payments on preferred stock were $442,777 last year and $1,024,269 in 1920.

During the year the company spent $2,045,662 for additions and improvements to its property, including the purchase of 111 new city and interurban cars.

The company's annual balance sheet shows properties, plant and equipment appraised at $37,805,862. Current assets are $2,160,534. Investments in capital stock of affiliated corporations are listed at $225,149 and amounts due from subscribers for capital stock are given at $1,061,839.

Unadjusted debits of the company are $1 082,615. Current liabilities are given at $3,240,193. The company reports a surplus on Dec. 31, 1921, of $700,664. The surplus on Dec. 31, 1920 was $863,013.

Receivers for Steinway Railway

S. W. Huff and Robert C. Lee, who were appointed receivers of the Steinway Railway, Long Island City, N. Y., on April 29, are expecting to take over the property as receivers on May 7. The Steinway Railway is an underlying company of the New York & Queens County Railway, which is not otherwise involved in this action. An early announcement of the receivership published in this paper last week was in error and no receivers have been appointed to take charge of the New York & Queens County Railway. The application for receivers for the Steinway Railway was made by the trustee representing the holders of the first mortgage bonds of that company.

Operating Deficit $1,796,418

Serious Loss in Revenue Caused to Company at Albany by Recent Strike

The operating revenues of the United Traction Company, Albany, N. Y., from all sources, during 1921, amounted to $1,199,783, operating expenses to $2,779,670 and taxes to $216,531. The operating deficit for the year was $1,796,418, which compares with $113,049 in 1920. The decrease in operating revenues was $2,054,190, or 63.13 per cent; operating expenses decreased $369,536, or 11.73 per cent, and taxes decreased $1,285, or about three-fifths of 1 per cent. The increase in the operating deficit was $1,683,369. These facts are all contained in the annual report of the Delaware & Hudson Company for the year ended Dec. 31, 1921.

The strike of the employees of the United Traction Company which began on Jan. 29, 1921, resulted in serious loss of revenues, the company explains, and in extraordinary additions to the expense of operating per unit. Additional revenue losses resulted from the illegal operation of "jitneys." The strike was formally abandoned on Nov. 24, 1921, although it was practically at an end long before that date, and the subsequent resumption of the use of these lines by the general public has been rapid, so that traffic is now nearly at the normal level. It is pointed out that continuous efforts by the legal department of this company have greatly reduced the competition of illegally operated motor vehicles. No difficulty has been experienced in obtaining a sufficient number of qualified men to operate the cars at the rates of wages fixed when the former Public Service Commission for the Second District declined to authorize the rates of fare necessary to support the rates of wages then in force and took its position in favor of liquidation of wages.

The port says the services supplied by the United Traction Company can be most satisfactorily rendered by one-man cars. The first car of this type was put in service during June, 1921; about ninety such cars are now in use in Albany and Troy and by July 1, 1922, it is expected that this type of equipment will be in operation for all regular, basic schedules, possibly excepting the lines between Albany and Troy and between Albany and Cohoes.

Since Jan. 28, 1921, under the order of the former Public Service Commission, the company has received 8 cents as its standard fare (four tickets being sold for 30 cents) in Albany and only 6 cents in Troy, Watervliet, Cohoes, Green Island, Waterford and Colonie and five in Rensselaer. This discrimination was considered by the former state authority to be required by the then-existing law. A statutory change having been made, by which the new commission is empowered to authorize reasonable rates in such cases, application for an equalization of rates was presented to the commission early in November, 1921. Testimony was taken and the case submitted upon briefs, and it is now awaiting decision. The report expresses the opinion that with properly equalized fares, one-man cars and the improved operation now possible, the income account of the property should become substantially more favorable.

Returns of Other Delaware & Hudson Lines

The operating revenues of the Hudson Valley Railway amounted to $970,779, operating expenses to $921,320, taxes to $64,066 and the net operating deficit to $14,607. The data show a decrease in operating revenues of 11.67 per cent and in operating expenses of 6.65 per cent, with an increase in taxes of 16.43 per cent and a decrease in net operating income of 125.60 per cent. Operating revenues were considerably reduced by the strike on the United Traction Company, as the employees refused to operate cars south of Waterford and into Troy from Jan. 29 to Aug. 17, 1921. By reductions made in October and November, 1921, and in January, 1922, the wages paid by this company were equalized with those paid by the United Traction Company.

On Aug. 9, 1921, the Public Service Commission allowed an increased fare on the interurban lines, representing an increase of 1 cent in each zone on the Glens Falls and Waterford divisions, with the exception of the line between Mechanicville and Waterford. The urban fares in Glens Falls, Hudson Falls, Fort Edward and Saratoga remain the same as formerly, that is, 7 cents. Full benefit from the new rates has not been obtained on account of labor troubles in and near Glens Falls and Fort Edward, the employees of the International Paper Company and other companies having been on strike since early last spring.

The operating revenues of the Plattsburgh Traction Company amounted to $39,320, an increase of 18.71 per cent; operating expenses to $40,171, an increase of 35.60 per cent, and the net operating deficit to $2,797, a decrease of 263.19 per cent in net operating income. In order to reduce operating expenses several of the cars will be altered from the two-man type to the one-man type, installing proper safety devices.

The operating revenues of the Troy & New England Railway amounted to $4,967, a decrease of 87.41 per cent; operating expenses to $15,153, a decrease of 65.87 per cent, and there was an operating deficit of $11,942, which compares with the deficit of $6,825 in the previous year. Service was suspended on Jan. 29, 1921, at the same time that the employees of the United Traction Company went on strike, as those of this company were members of the same union as those of the United Traction Company. A temporary trestle was constructed to replace a bridge that had been destroyed and the line was opened for traffic on May 28, 1921.

Weekly Pass Is Holding Earnings Up in Fort Wayne

Results of the first eight weeks operation with the weekly pass on the Fort Wayne city lines of the Indiana Service Corporation are shown in a general way in the accompanying tabulation of comparative earnings by weeks for 1921 and 1922. For the first two months of 1922, before the weekly pass was started, the gross revenue fell behind that for the corresponding weeks of the previous year rather consistently, and for the two months there was a total decrease of $2,595. During the next eight weeks, with the pass in effect, the earnings were rather consistently above those for the corresponding weeks of the previous year. For these first eight weeks of the pass the total earnings showed an increase of $2,482 over the total earnings for the corresponding eight weeks of 1921. The differential in earnings between the first eight weeks without the pass and the next eight weeks with the pass is therefore $5,078. This, of course, may not be a true measure of the increase in revenue attributable to the pass, as part of the increase may be due to other traffic conditions unaffected by the pass. The number of passes sold is also shown in the table, from which it will be seen that the number sold increased steadily during the first five weeks, but since then has remained about constant.

FORT WAYNE CITY LINE EARNINGS BY WEEKS

1921					1922				Increase
Jan. 3	Jan. 9	$18,677.72		Jan. 2	Jan. 8	$18,302.66	*$375.06*

Readjustment Plan Outlined

Interborough and Manhattan Elevated Work Out Plan Subject to the Approval by Security Holders

Judge Julius M. Mayer at New York announced on May 3 the revised plan of readjustment of the terms of the Manhattan Elevated Railway lease, carrying with it complete refinancing of the Interborough Rapid Transit Company and many other measures which were regarded by members of the Transit Commission as in themselves offering assurance, if adopted by the security holders, of improved conditions for years to come.

A summary of the plan authorized by Judge Mayer says it averts a receivership and avoids the imposition of a double fare, which a separation of the elevated from the subway lines would have entailed. "By keeping the system together without a receivership," it is stated, "the continuation of the 5-cent fare over the entire Interborough Rapid Transit system is assured."

OUTLINE OF TENTATIVE FINANCIAL PLAN

This plan, which has been agreed to by committees representing the Interborough bondholders, the Inter.-Met. 4½ per cent bondholders and the Manhattan stockholders, contains the following provisions:

1. Provision of $15,000,000 to meet the demands of the Transit Commission and other capital requirements of the company by an issue of ten-year 6 per cent gold notes, to be taken by a syndicate or by the holders of the Inter.-Met. bonds, who will become the stock owners of the Interborough stock.
2. Replacing the old 7 per cent guaranteed rental of the Manhattan by a new rental to be paid out of earnings. The highest guaranteed rental under the new plan is 5 per cent.
3. Reorganization of the directorship of the Interborough to include representatives of the Manhattan Company, the Transit Commission and the City of New York, "if they elect to avail themselves of the privilege."
4. Limitation of earnings on Interborough stock to 7 per cent, a provision which is expected to remove the stock from the speculative class of securities. Earnings in excess of 7 per cent, it is understood, will be put into improvements on the property.
5. Elimination of the Interborough Consolidated Corporation as the holding company controlling the Interborough Rapid Transit Company. In place of the Interborough Consolidated $45,740,500 preferred stock, 932,626 shares of common stock and $63,808,000 collateral trust bonds, there will remain only the $35,000,000 stock of the Interborough itself.

The agreement was declared by the negotiators to have been effected in the expectation of co-operating with the Transit Commission in its plans for making unification of the lines effective.

COMMISSION WILL ANNOUNCE PLAN FOR NEW CONSTRUCTION

The Transit Commission will announce shortly the provisions of its $250,000,000 construction plan for new subways, which will be made effective at the earliest date. Construction work on the Queensboro extension to Times Square will begin at once.

Judge Mayer and the security holders' committees transmitted the readjustment plan to George McAneny, chairman of the Transit Commission, with a letter explaining that the plan was intended to conform to the general plan of the commission for reorganization of the city's transit facilities. The commission will take no action on the matter until it is made the subject of formal application for approval by the stockholders. The plan must first receive the approval of the 35,000 owners of stocks and bonds of the two companies.

Report of Sale of Tide Water Power Company Confirmed

The banking house of A. E. Fitkin & Company, New York, confirms the rumor of the purchase of the controlling interest in the Tide Water Power Company, Wilmington, N. C., formerly owned by Hugh MacRae, banker, Wilmington. Mr. Fitkin and his associates state that they acquired considerable in excess of 51 per cent of the common stock of the Tide Water Power Company, and that they had extended an offer to the remaining holders of the outstanding stock to purchase their holdings at $125 per share and had set as the final date for acceptance, June 23, 1922.

The Tide Water Power Company for the year ended Dec. 31, 1921, reported gross revenue of $1,043,775 and net income of $333,247. The company has paid regular dividends on its preferred stocks for fourteen years and on its common stock for ten years at the rate of 7 per cent per annum.

This property, in addition to other holdings in which A. E. Fitkin & Company are interested, will be operated under the management of the General Engineering & Management Corporation. The report of the purchase was referred to in the ELECTRIC RAILWAY JOURNAL for April 29.

Financial News Notes

May Appoint Receiver.—It is very likely that within a short time a receiver will be appointed to supervise the handling of the property of the St. Albans & Swanton Traction Company, St. Albans, Vt. Operation was discontinued on Nov. 11, 1921.

Release from Receivership Probable by Sept. 1.—The City Council of Pittsburgh, Pa., has been informed by Special Counsel Robinson that the Philadelphia Company plans to take over the Pittsburgh Railways and to secure a release of the receivership on or prior to Sept. 1.

Abandonment Approved.—The Public Utility Commissioners of New Jersey have approved the application of the Trenton & Mercer County Traction Corporation, Trenton, N. J., to abandon property at Second and Lalor Streets, Trenton. The building on the corner will be razed.

Will Hear Suspension Application.—The Ohio Public Utilities Commission will hold a hearing on May 23 on the application of the Steubenville, East Liverpool & Beaver Valley Traction Company's petition for abandonment on certain lines. Company officials will show at that time the losses sustained on the River road and Pleasant Heights car lines on which the company wants to suspend operation.

Hearing Scheduled.—Hearing on the valuation of the property of the St. Paul City Railway, Minneapolis, Minn., will take place on June 1. Postponement was made on April 25, the day previously set for the hearing before the Railroad and Warehouse Commission. The hearing is to bring about a basis for a decision as to a reasonable rate of fare for a proper return on the investment.

Frank Coates a Cities Service Director.—Frank R. Coates, John M. McMillin and W. A. Jones have been elected to the board of directors of the Cities Service Company, succeeding Benjamin N. Freeman, Sir E. Mackay Edgar and Horton H. Scott, who resigned at the expiration of their terms at the stockholders' annual meeting. Mr. Coates is president and general manager of the Community Traction Company, Toledo.

Wants to Issue Certificates.—A. O. Chapin, receiver for the Cleveland & Erie Railway, Girard, Pa., has applied to the District Court at Erie asking for permission to issue receiver's certificates, not to exceed $11,000 for the purpose of purchasing power from the Northwestern Electric Company. In the petition the receiver alleges that the present power plant of the traction company, located at Elk Park, Erie, is dilapidated and not capable of furnishing the necessary power.

Bonds To Be Redeemed.—The Detroit United Railway through its treasurer, A. A. Gingrass, has called for redemption its five-year 7 per cent collateral trust gold notes on June 1, 1922, at the office of the Central Union Trust Company, New York. The bonds will be redeemed at 100½ per cent of the face value of principal and accrued interest, $2,000,000 face value of notes of this issue. The bonds were issued under collateral trust indenture dated April 1, 1918, between the Detroit United Railway and the Central Trust Company as trustee.

Councilman Wants City to Take Over Line.—A move to have the city of Columbus, Ohio, purchase and operate the Columbus, Urbana & Western Electric railway, which at present operates between Columbus and the storage dam, has been launched by Councilman H. L. Justus, who says he will introduce an ordinance to that effect. Councilman Justus would have the city extend the line to the site of the proposed O'Shaughnessy dam some distance up the river. The councilman points out that the line could be operated with current supplied by the municipal light plant. The line at present is 7½ miles long.

Traffic and Transportation

New Commutation Rates

Milwaukee Company Has Set Out Determined to Increase Popularity of Its Interurban Lines

In an effort to increase the popularity of its interurban railway service and to attract additional traffic thereto, the Milwaukee Electric Railway & Light Company placed in effect on April 10 a new commutation rate and modified the conditions under which commutation rates formerly in effect could be purchased, so that its patrons can now purchase transportation over its interurban lines under as liberal terms as possible.

Many Kinds of Commutation Tickets Available

All forms of commutation tickets are now available between any two points on any one of the four interurban lines of the company. In addition to commutation tickets previously sold, a ten-ride commutation ticket good for the use of the individual purchaser, during a period of six months from date of sale, is being sold at the rate of 2.1 cents per mile. There is also being sold for $20 a 1,000-mile book. This book will be honored for transportation on the lines of a number of electric railways in Wisconsin and will in effect be an interchangeable mileage book so far as electric railways in Wisconsin are concerned.

Prior to April 10 the company was selling a twenty-five-ride commutation book, a fifty-two-ride commutation book, a forty-four-ride students' commutation book and a 500-mile mileage book. All these carried transfer privileges to city cars on the inbound trip into Milwaukee, Racine and Kenosha. The new ten, twenty-five and fifty-two-ride books placed on sale on April 10 will permit the user to reach the interurban lines of the company in Milwaukee, Racine and Kenosha on the outbound trip also without paying an additional city fare. This will be accomplished by having city coupons attached to the interurban coupons in the books in question. The city coupons will be detached from the book in the presence of the city conductor, who will issue a transfer to the interurban lines.

Provides for Redeeming Unused Coupons

Another new feature of the commutation rates will be provision regarding redemption of unused coupons. Thus in the case of the twenty-five ride commutation ticket, which is sold at the rate of 2.25 cents per mile and is good for any number of people for a period of six months, five or fewer unused coupons will be redeemed at the purchase price originally paid per coupon. Unused coupons in excess of five will be redeemed on the basis of purchaser not paying in excess of the usual ticket fare for the number of coupons actually used. Similarly the fifty-two-ride commutation book, which sells at 1½ cents per mile and is good for the use of the individual purchaser during the calendar month in which purchased, twelve or fewer unused coupons will be redeemed at the original purchase price per coupon. This will also be true of the forty-four-ride students' commutation, which also sells at 1½ cents per mile and is good during the calendar month purchased for the use of the original purchasers who must be between ten and twenty-one years of age. School children under ten years of age can purchase a similar book at the rate of 1 cent per mile. In the case of the students' books, eight or less unused coupons will be redeemed at the original purchase price per coupon.

The 500-mile mileage book is sold at the rate of 2¼ cents per mile. The 1,000-mile mileage book will be sold at 2 cents per mile.

In connection with the introduction of the new rates, there were posted in all ticket offices of the company placards calling attention to the changes in the rates and conditions of sale. The new rates were advertised in the newspapers in the territory served by the interurban lines of the company. There was also distributed to passengers on the cars a leaflet giving information regarding the changes effected.

Through Rates on Utah Interurban

Arrangements have been made whereby through rates between points on the Bamberger Electric Railroad, Salt Lake City, Utah, in Davis and Weber Counties and points on the Union Pacific and its connections, Cheyenne and east, will be established and the necessary tariffs will be published at an early date.

The rate is made in compliance with a request made by the Public Utilities Commission on March 1, in which it was pointed out that 3,000 carloads of fruits and potatoes would be produced in the territory named this year.

The agricultural territory along the lines of the Bamberger Electric Railroad, particularly that section which is under the Bonneville Irrigation project, has developed very rapidly, and the granting of these through rates means still greater development on account of increased transportation facilities to the eastern markets via the Bamberger Electric in connection with the Union Pacific.

The Bamberger Electric already has through rates in connection with the Denver & Rio Grande Western Railroad.

Fare Order Suspended

Temporary Restraint Is Permitted in Chicago Against the Six-Cent Fare Ruling of State Commission

Temporary suspension of the 6-cent fare order of the Illinois Commerce Commission was directed by Judges Evans, Page and Geiger in the United States District court in Chicago on April 28. The judges announced that they had not had time to consider the evidence and arguments, and without passing on the contention of the Chicago Surface Lines that this rate would be confiscatory, they granted a temporary restraining order and allowed the attorneys until May 8 to file briefs.

Discussion of wages paid to employees of the surface lines formed an interesting part of the hearing. The Commerce Commission had stated that a 6-cent rate could be made effective without disturbing wages, but lawyers for the companies insisted that the commissioners had no authority to enforce other economies which they estimated would save about $14,000,000. These proposed economies included reduction of allowances for rate of return, maintenance, renewals and damages and a cancellation of payments to the city for street cleaning and sprinkling.

James M. Sheean, attorney for the companies, stated that the commission had no authority to direct a lower wage scale, but he said if the companies should undertake this now the commission would then order a rate of fare lower than 6 cents. The platform men in Chicago are receiving a maximum wage of 80 cents an hour, the highest in the country for surface lines, but they have insisted that the high rents in Chicago have made a lower scale impossible and they threaten to strike if their pay is cut.

The city's lawyer had suggested to the judges several times that if they find the 6-cent rate to be too low they would have authority to grant an injunction with conditions which would prevent the companies from charging as high a rate as 8 cents. The companies' attorney also thought that this might be possible.

The commission based its 6-cent order partly on an estimate that 50,000,000 extra passengers a year would be attracted by the lower rate. Counsel for the company showed that the commissioners had overlooked the fact that it would cost about $3,000,000 additional to haul these passengers.

Electric After Steam Road Business

It is now possible to ride between Tiffin and Toledo, Ohio, by way of the Tiffin, Fostoria & Eastern and Toledo, Fostoria & Findlay Railways, and save 60 cents on the round trip over and above the steam railroad fare. The time for the distance, about 52 miles, is two hours and twenty minutes. The steam road's time for the trip is less than two hours.

Service Order Issued

I. R. T. Required Greatly to Increase Service—350 Additional Cars to Be Bought

The New York Transit Commission at a session held late on the afternoon of May 2 adopted two separate orders, one providing for an immediate increase in both train and car facilities by the Interborough Rapid Transit Company, to be effective on May 31, and a materially greater increase to be effective Sept. 18; the other, directing the placing of orders for 350 new steel cars.

Under the May schedule 246 additional trains will be operated during each twenty-four hours, while through the lengthening of many trains, there will be an increase of the number of cars in service of 2,014 per day.

Engineers Estimate May Schedule

The September schedule will add a further increase of 114 trains a day, making a total increase of 360 over the present operation, and increasing the total trains operated from 2,773 to 3,133. All this was explained to the newspapers by Chairman McAneny of the commission.

The estimates of the engineers of the commission show that under the May schedule alone there will be an increase of approximately 8,000,000 car miles—or 400,000,000 car seat miles—per annum. The immediate increase per day in car miles will be 20,935, and in car seat miles 1,046,750.

To operate the May schedule will require the employment of the full force of reserve crews now in the service of the company, numbering 300 men. The September schedule will require a further increase of 300, who are to be employed and trained for service during the summer months.

The equipment order directs the company to proceed with the order for the first 100 of the total of 350 cars immediately, and their delivery as soon as it is possible for the manufacturers to turn them out. On Aug. 1 the company is directed to place a further order for fifty cars to be delivered as soon thereafter as possible, and the final order for 200 must be placed within six months after the contracts for the construction work remaining to be done on the Jerome Avenue and the 180th Street yards and the 148th Street yard and shops have been finally approved and are ready to be delivered.

Rush Hour Service to Be Cared For

Under the sequence the orders are to take, the company will be required practically to exhaust its present man force on May 31, and in September to further extend toward a maximum the use of its present equipment. When the new cars have been provided, a third stage will be reached when still greater improvement, including material extension of the rush hour service, will be brought about.

The September schedules are based upon the operation of trains on a three-minute interval during the midday non-rush hours, against the present average of something over four minutes, while a considerable measure of relief is also given the rush hours. With the company's present equipment and the present working force, including the reserves who are to be drafted on May 31, it will not be possible, the commission says, to operate three-minute non-rush-hour trains. The intermediate schedule provides, therefore, for 3½-minute intervals in the middle of the day, though with material additions in the other hours before and after the morning and evening rush.

Yard Facilities a Problem

The work upon the yards, the completion of which will from now on afford the key for the final and in some respects the most important extensions of service to be made, is to be pressed by the commission as rapidly as the incidental contracts are approved by the Board of Estimate and Apportionment. Pending the completion of the building of these new yards, however, the company, under the supervision of the commission's engineers, is to provide temporary yard facilities and inspection sheds for that part of the increased service, possibly the full 150 cars included in the first orders, that can be taken care of without awaiting completion of the permanent yards.

General O'Ryan, a member of the commission, in a concurring opinion explained as follows:

> In the course of the proceeding it became apparent that the deficiencies in service were so great that the extent to which trains should be added would, from a practical point of view, become a financial problem rather than an operating problem. It is settled law that a regulatory commission, in the exercise of its regulatory powers over public service corporations, may not lawfully impose requirements, the cost of which would amount to confiscation of the company's property. After careful consideration of all the evidence offered in this proceeding, it became apparent that with the reduction in operating costs that has taken place during recent months, and with similar increase in revenues, there exists a very substantial sum which the company may annually be required to expend for increased service, without violating the limitation of law referred to.

The Interborough will abide by the order of the commission. A statement from the company says:

> Frank Hedley, president of the Interborough Rapid Transit Company, stated that the directors of the company had authorized the acceptance of the orders of the commission for additional service and for the purchase of additional cars, and that immediate steps would be taken to place the order for the first 100 cars required by the Transit Commission. He stated further that in transmitting the formal acceptance of the order he had written to the Transit Commission that while the company, without waiting for any further action by any official body, will place forthwith the initial order for 100 cars, it is his opinion that to make the cars effective for the service of the public next winter it will be necessary, as he testified upon the hearing, that provision be made for the temporary yard tracks at the Jerome Avenue yard and at the 180th Street yard and for the temporary yard and shop facilities at the 148th Street shops in accordance with drawing heretofore transmitted to the commission, and that until such provision shall be made the company will have no place to receive the cars.

Low Fare Bill Defeated

Three-Cent Fare Measure for Seattle Disapproved by Voters—Railway Must Be Self-Supporting

Councilman Erickson's 3-cent fare bill for the Seattle (Wash.) Municipal Railway was defeated at a general election on May 2 by a three to one majority. A trifle over 15,000 voted for the measure and more than 40,000 against it. Only 1,699 more persons voted for the measure than signed the original initiative petition which placed the measure on the ballots. The bill was voted down in all but ten of the 294 precincts and in the ten only bare majorities were returned for it.

Other Amendments Rejected

The department of public utilities which operates the municipal railway lines was not abolished as provided in Erickson's proposed charter amendment No. 3. Voters also rejected the amendment which would have created a separate department of the municipal street railway and created a department of transportation the superintendent of which would have been a member of the Board of Public Works appointed by the Mayor for three years.

Crushing defeat of the Erickson measure comes as a climax to a long fight which has been waged to prevent the invasion of the general tax fund of the city to defray the cost of maintaining and operating the municipal lines. The fight has been waged not only in opposition to the tax measure but also in the courts to establish finally the principle that the street railway as well as all other publicly-owned utilities must be self-supporting and in no way dependent on taxation for any part of its existence.

Five-Cent Fare Bill in Prospect

Immediately following the rejection of the Erickson scheme Councilman C. B. Fitzgerald stated he would at the first meeting of the new City Council after June 5, introduce a 5-cent fare bill. Mayor-elect E. J. Brown and two newly-elected councilmen during the campaign pledged themselves to a 5-cent fare. Other councilmen who hold over in their political offices favor a reduction in the present fares, which are 10 cents cash or tokens for 8⅓ cents.

Pass Plan in Effect in Terre Haute

The weekly pass plan went into effect on May 1 on the 5-cent city cars of Terre Haute by the Terre Haute, Indianapolis & Eastern Traction Company. The company recently applied to the Indiana Public Service Commission for permission to install the unlimited-ride transferable weekly pass to be sold for $1. The plan of the company was referred to in the issue of the ELECTRIC RAILWAY JOURNAL for April 15, page 660.

Increase in Fares Authorized

The New York Transit Commission, under compulsion of a court decision issued an order on May 2 allowing the New York, Westchester & Boston Railway operating from White Plains to and through the Bronx to the Harlem River at 133d Street, New York, to increase its fares between stations in the City of New York from 5 cents to 7 cents. It is not a New York City railroad and is not in the class of railway corporations which can be brought into the plan of readjustment being prepared by the Transit Commission. Under the law the commission may allow increases to companies which do not come under the plan of readjustment.

This case was handed to the Transit Commission by the Public Service Commission for the First District, before which it was begun in 1919 when that commission started an inquiry into the tariff filed by the company for an increase in fare from 5 to 7 cents. The commission subsequently denied the petition on the ground that it had not been delegated the power to authorize increases in such rates. The railway then appealed to the Supreme Court and obtained a writ of certiorari to review the commission's decision. On July 2, 1920, the Appellate Division sustained the writ and referred the matter back to the commission. The case by permission was appealed to the Court of Appeals, which on Feb. 21, 1921, affirmed the order of the Appellate Division. Following the decision of the Court of Appeals a hearing was held on April 5 and on April 25 the Transit Commission succeeded the Public Service Commission and took up the case.

It was brought out in these hearings that the 5-cent fare was unreasonable and the Appellate Division stated in its opinion that it was evident that the contemplated public service could not be rendered at the rate of fare prescribed in the city ordinance, namely 5 cents. The Transit Commission found that in 1920 and during a part of 1921 the existing 5-cent rate was inadequate and that according to the company's estimates under the proposed 7-cent rate, there would be only a small balance after the payment of operating expenses and taxes and not sufficient to pay all interest charges. It was also shown that the proposed rate is substantially lower than the rate charged for corresponding distances on the Harlem Division of the New York Central Railroad.

Claims Roads Can't Be Built on Increased Fares

W. V. Hill, manager of the California Electric Railway Association, recently made public an opinion that high fares, which the California Railroad Commission had authorized in most cities, alone would not prove enough to encourage making extensions or building new electric railway lines. He said that the reason there was practically no new building had nothing to do with fares, but with the life of franchises. It was impossible in this day to finance electric railway enterprises in California, because of the limit of time of franchises. He declared that modifications of these conditions would have to be made before there would be any activity in electric railway construction.

Uniform Fare Case Reopened

At Albany on April 28 Chairman Prendergast of the Public Service Commission issued an order reopening the case of the United Traction Company in its application for readjustment of fares in Troy, Watervliet, Cohoes and Rensselaer to make them uniform with those in Albany. Much speculation is rife as to the reason for the order, but as yet the chairman has neither set a date for the hearing nor has he served the company with a bill of particulars.

The question of one-man cars is only one of a wide range of possibilities on which the commission may be seeking additional evidence.

John E. MacLean, counsel for the company, is quoted as saying:

> The proceedings by the commission in demanding additional evidence is not unusual. It happens quite often . . . . At the hearing last February one-man cars were brought into the case and evidence was introduced to show that the operation of the new cars so far in the experience of the company, had not reduced expenses enough to prevent the company from getting its proposed uniform fares in cities in which its lines are operated.

Transportation News Notes

P. A. Y. E. Installed.—The Public Service Railway of Newark, N. J., has placed pay-as-you-enter cars on all the lines running out of Market Street, Camden, N. J.

Railway Gives Up Mail Contract.—The Bridgeton & Millville Traction Company, Bridgeton, N. J., has notified the post office department that it will terminate its contract to carry mails from Bridgeton south to Bivalve after May 8.

Express Service Maintained.—The Southwest Missouri Railroad, Webb City, Mo., started on March 15 the handling of local express shipments from all towns on the line between Carthage, Mo., and Picher, Okla.

One-Man Cars on Toledo Belt Line.—The Community Traction Company, Toledo, Ohio, will experiment with cars operated by one man on the Bancroft belt line. Cars now in use on the line will be equipped with new entrances, turnstiles and other safety devices.

Ex-Service Men Want Reduced Fare.—The City Council of Seattle, Wash., recently received a petition from forty ex-service men, disabled veterans, patients at the Cushman Hospital at Tacoma, for the privilege of riding on cars of the Seattle Municipal Railway on the school fare of 2½ cents.

Round-Trip Rates Reduced.—Reduced round-trip rates effective on all Sundays during the summer months were placed in effect between Springfield and Columbus, Ohio, and way points April 23 by the Indiana, Columbus & Eastern Traction Company. The new round-trip rate is $1.75 between Columbus and Springfield. The regular fare between the two points is $1.25 one way.

Saving Effected.—New ticket forms for commutation tickets from Minneapolis to Hopkins and Lake Minnetonka over the suburban lines of the Twin City Rapid Transit Company save the riders who have to take a local trolley trip to reach the suburban cars 6 cents. Heretofore, there has been no coupon to cover this extra ride. The new forms provide local coupons either going or returning.

Seeks New Regulation.—A suggestion has been made to the Trenton (N. J.) City Commission calling for the stopping of trolley cars from the near to the far side of the street. It is pointed out that if this regulation was adopted then vehicles following trolley cars could make the turns of corners without waiting for the trolleys to move. The commission arrived at no decision concerning the plan.

Fare Reduced.—The fare of the Inter-City Terminal Railway line from Main and Markham Streets to Levy has been reduced from 13 to 10 cents, according to P. C. Warren, manager of the company of North Little Rock Ark. Heretofore the passenger has been paying 5 cents on the bridge bus, 3 cents for a transfer, and then an additional 5 cents for points outside the city limits. The fare to Rose City remains the same.

Favors Island Terminal Project.—The Navy Department of the United States favors turning over portions of Yerba Buena Island in San Francisco (Cal.) Bay for terminal facilities. The document which makes known the department's attitude says that the island must be available for all transportation companies without distinction. Hearings on the proposition are to be held in San Francisco under the direction of Admiral Halstead.

Reduced Rates for Anglers.—The Portland Railway, Light & Power Company, Portland, Ore., has recently announced a new reduced round-trip rate that will be effective on Sundays on the interurban lines of the company for the coming trout season, and for the regular summer excursion and outing season. The rates will go into effect at once, to take care of the crowds that always try their luck at angling the first week end of the trout season. They will continue until Nov. 15. The new rate provides for a fare of 75 cents for the round trip to Bull Run, good Sundays only, and to Estacada, Sundays only, $1 for the round trip. The round-trip fare to Gresham will be in effect every day, at 50 cents for adults, and 25 cents for children between the ages of five and twelve years.

Personal Mention

Mr. Colton Edits "Aera"

Hartford "Times" Editor Selected by Association Was Formerly With Connecticut Company

John W. Colton has been selected for the post of editor of *Aera*. He will enter upon his duties at once. Here was a case of the job seeking the man. There is no reason to suspect that John W. Colton was not happy and contented as associate editor of the *Times* up in Hartford. He was engaged there in work which has been a hobby with him since he entered journalism in Boston, and while the post he filled at Hartford was one of great responsibility, still the appeal was irresistible for him to throw himself into the larger work which the position with the association offered. Nor will this work be altogether new to him. As the executive assistant to President Storrs of the Connecticut Company during 1919 Mr. Colton acquired a knowledge of the railway business which gave him just the experience essential to the editorship of *Aera*. The engineer, the accountant or any other specialist in electric railway affairs could hardly qualify for the post. This is no reflection on the ability of any of these specialists, no more so than it would be to say that your out-and-out journalist, unless he was especially adaptable as was Harlow C. Clark, could fill the *Aera* editorship acceptably.

J. W. COLTON

It is a peculiar combination of talents that is required for the *Aera* editorship and John W. Colton has it. He became a student of electric railway problems a number of years back in Masachusetts.

One of Mr. Colton's first assignments in newspaper work was to cover the electric railways, and as assistant city editor of the Boston *Journal* in 1904 and 1905 and as news editor of the Springfield *Union* from 1906 to 1918 he paid particular attention to the problems of the electric railways. In 1918 Mr. Colton was called to the Bridgeport district office of the ordnance department to take charge of the publicity of the Bridgeport district, which at that time had very important plans under way for the dilution of labor in munition factories and increasing production by various other means. From this post Mr. Colton went to the Connecticut Company as executive assistant to President Storrs. There his jurisdiction covered information and advertising, among other things. His big work with the Connecticut Company, however, was in educational publicity among the employees of the company. The employees were sold on their own company, but Mr. Colton succeeded in getting home to the men the idea of selling their own company to the general public. From the Connecticut Company Mr. Colton went to the post on the Hartford *Times* which he will now relinquish.

Like most other newspaper men Mr. Colton is a very good listener. Also like most other newspaper men his suggestions are constructive and pertinent. It is these qualifications that fit him admirably to sit in at the meetings of the various committees of the association at which the editor of *Aera* is both a student and a counselor.

KEEPS AT IT

It was the privilege of the ELECTRIC RAILWAY JOURNAL to publish in the issue for Jan. 3, 1920, an article "A Forward Look in Public Relations" from the pen of John W. Colton. In that review Mr. Colton unconsciously fixed a place for himself in the industry that made it almost essential that some time or other he should be called back into the fold, although at the time the thought that he would ever again enter electric railway work was to him probably the remotest thing in the world. As the last of six pertinent points emphasized by Mr. Colton in that article he recommended keeping everlastingly at it. There is the motto of John W. Colton: "Keep Everlastingly at It."

F. F. Lilly Heads Company Paper

F. F. Lilly, publicity director of the Union Gas & Electric Company, Cincinnati, Ohio, has succeeded A. W. Thayer as editor of *Green Line Topics*, a pamphlet issued weekly by the South Covington & Cincinnati Railway, Covington, Ky., in the interest of its patrons. Mr. Thayer has joined the staff of a national advertising concern at Chicago. For the time being, Mr. Lilly will edit *Green Line Topics* and direct the publicity campaign of the Union Gas & Electric Company.

Director Formerly Sold Papers

J. W. Walsh Started as Newsboy on Bamberger Electric Railroad With $5 Capital

The most interesting thing about people, perhaps, is that you never know what they are going to do. This differs somewhat in meaning from the statement that they do the unexpected. At least, the two remarks differ when applied to John W. Walsh. The difference would be apparent if you had been privileged to observe him when he was selling newspapers and magazines on the Bamberger Electric Railroad, Salt Lake City, Utah, and if you are privileged to know him now that he is the recently elected director of that same road.

The point is that every one expected him to do the unexpected, but none knew what the unexpected would be. The sublety, after all, probably lies in the personality of Mr. Walsh and not in any truism about the genus homo. The subtlety, after all, probably lies in haps tell from the set of the tie, the slope of the shoulders, the slant of the forehead, just what manner of man he may be. But anyone, even without studying any directions about reading character at sight, could tell from the quiet, keen eyes that he had battled against odds and was not satisfied until he had won.

J. W. WALSH

Some of the odds—in fact, most of them—were due to the fact that for a start he had only $5. Today $5 would be very little of an open sesame to any kind of success. It was not much more help fourteen years ago, as any good financier will testify. The deduction follows, of course, that success came, not from money, but from ability and application. Mr. Walsh, with five dollars, confidence and enthusiasm, presented himself to Governor Bamberger toward the completion of the Bamberger Railroad, and asked for the privilege of selling papers on the trains. Impressed not so much by the five dollars as by the two rarer assets, Governor Bamberger gave him

Digitized by Google

the right, and in addition allowed him to plan for a stand at the Salt depot. Later he opened a stand at Ogden, then north in the state as far as Preston when the Ogden Rapid Transit Company was opened. He expanded this work to the Orem lines later, and to the Los Angeles & Salt Lake Route.

Mr. Walker, in the fourteen years since he first walked into the president's office, has formed the Walsh News Company and the Beehive Advertising Company. He is president of both companies.

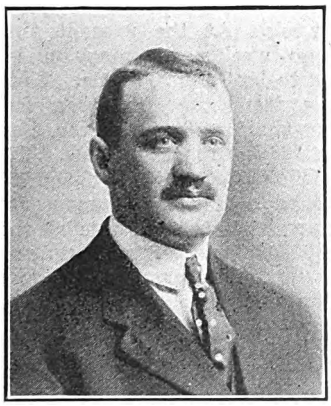
Governor Bamberger recently said that Mr. Walsh has the qualities of ability and trustworthiness. It was these qualities which won him when the embryo railroad director asked for the privilege of selling papers.

Philadelphia Appointments of Interest

G. P. Good Is Transportation Chief—E. G. Allen Joins Mitten's Company as Chief Engineer—R. T. Senter and F. W. Johnson to Assist President —Mr. Johnson Will Edit "Service Talks"

With the appointment, previously announced, of George P. Good as superintendent of transportation and Elbert G. Allen as chief engineer of the Philadelphia Rapid Transit Company, that company places in its important executive positions two prominent leaders.

Mr. Good looks back upon a long career of steady service with the Philadelphia company. Twenty-eight years ago he started as motorman—in latter day terminology—of one of the Market Street cable cars. At that time his title was gripman, but he became a true motorman when the company installed the electric trolley system. He soon became instructor of new motormen, but passed on to greater duties as starter at Front and Market Streets. His knowledge of electric trolleys soon made him a valuable inspector, and later floating inspector, street dispatcher, street superintendent, assistant divisional superintendent at the Forty-first Street and Haverford Avenue carhouse, and floating division superintendent.



G. P. GOOD

Thus he came to 1910. His advance continued to be rapid, for he became district superintendent of the western district, and of the northern district later. Last year he stepped into the position of assistant superintendent of transportation. His recent appointment is the logical sequence of his splendid work and the knowledge he has gained of problems peculiar to this company.

Mr. Allen's work as chief engineer will be to co-ordinate all the engineering activities of the company. He brings to his work the experience of twenty years with Stone & Webster properties. From 1903 to 1907 he was electrical and mechanical engineer of the Seattle (Wash.) Electric Company. There he had supervision of design, construction and operation of power supply substations, transmission and distribution, including the design and construction of a 50,000-volt substation and a 13,000-volt distribution system to substations. While with the Seattle company he was connected also with the Columbia Improvement Company in the design and construction of electrical features of the hydro-electric plant at Nooksack Falls and a 50,000-volt transmission line to Bellingham, Wash., which extended for 40 miles. He lectured on street railway engineering at the University of Washington.

From 1907 to 1921 Mr. Allen was supervisor for companies of the Stone & Webster Engineering Corporation at Dallas, Tex.; Helena, Mont., and the White River hydro-electric plant at Seattle. He did special investigating for the Boston office of Stone & Webster for many projects, and assisted in the designing of the Hog Island shipyard.

In September, 1921, Mr. Allen joined the Mitten Management, Inc., of Philadelphia, spending the following months on power matters for the International Railways, Buffalo, N. Y. His recent appointment as chief engineer of the Philadelphia Rapid Transit company became effective April 1.

Other appointments, which are effective April 15, are those of R. T. Senter, as assistant to the president on special assignment, and of F. W. Johnson as assistant to the president. Mr. Johnson will continue as editor of *Service Talks*.

H. J. Woodard has been promoted to the position of assistant auditor of the Georgia Railway & Power Company. The appointment is effective at once. Mr. Woodard has been connected with the company since 1910 and was promoted from the position of head bookkeeper. He will have charge of the general books and monthly statement work. Mr. Woodard suceeds F. A. Brine, who was made auditor on April 1 in the place of H. Flynn, now assistant comptroller.

E. R. Shepard Begins Private Practice

E. R. Shepard, who has been active in connection with the electrolysis work of the United States Bureau of Standards, has resigned from the Bureau to follow the same line of endeavor under his own name. Mr. Shepard was graduated from the electrical engineering department of the University of California in 1904 and in 1906 received the degree of M. A. from Harvard University after two years of post-graduate work in physics and engineering.

He then was employed by Stone & Webster and was associated with the Columbus (Ga.) property of that firm for nearly two years. From 1909 to 1914 he was assistant professor of electrical engineering at the Oregon Agricultural College. He has been with the Bureau of Standards since 1914. Mr. Shepard's publications, his numerous electrolysis surveys and field studies, and his activity in connection with the publications and research work of the American Committee on Electrolysis, of which he is a member, are well known. He is the author of reports on "Modern Practice in the Construction of Rail Bonds and Joints for Electric Railways" and "Leakage Resistance of Electric Railway Roadbeds and Its Relation to Electrolysis." Besides these, he has prepared numerous short articles on three-wire distribution for electric railways, electrolysis of lead under continuous and periodic currents, and reports of electrolysis surveys in various cities.

E. G. ALLEN

Most of the electrolysis surveys which have been conducted by the Bureau of Standards during recent years, as well as the field studies jointly conducted by the Bureau and the American Committee on Electrolysis, have been under the personal direction of Mr. Shepard. His experience in handling the electrolysis problem in a co-operative manner, the viewpoint which he has acquired through contact with all of the affected interests, and his intimate knowledge of all phases of the problem should contribute to qualify him in an unusual manner as an independent engineer in that field.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

American Equipment for Chinese Tramways

According to Commercial Attaché Arnold of the United States Department of Commerce in Peking, China, the contract for electrical equipment for the Harbin tramways, including the power plant, has been awarded to the Hua Sheng Trading Company, representing an American firm. The amount involved is $2,270,000 gold. The above-mentioned company is composed of Chinese and American interests and the equipment for this contract will come largely from the United States.

Additional Electrification of Swiss Federal Railways

The Swiss budget of 1922 provides 57,000,000 francs for electrification of the Federal railways, according to a report to the United States Department of Commerce from Berne. It is hoped that the electrification of the Bellinzona-Lugano-Chiasso, the Erstfeld-Lucerne and the Goldau-Zug lines will shortly be completed. The Amsteg power station, of 80,000 hp., will be ready to furnish energy about April, 1922, and the Lucerne-Zug-Zurich line will probably be electrified by the end of the year. Together with the St. Gothard, the Sion-Lausanne line is to be electrified and will be opened in the summer of 1923. The current will be supplied by the 60,000-hp. Barberine station, which by that time will have been completed.

Favorable Report from British Company

The Metropolitan-Vickers Electrical Company, which is one of the recent big British amalgamations (it includes the British Westinghouse Company among other concerns), has reported quite a favorable year despite trade depression. A. Aunan Bryse, presiding at the annual meeting on April 5, said that the profit was £440,342, or nearly £40,000 in excess of that for 1920. Orders received were considerably lower than in the preceding year, but they were able to keep the shops fully employed owing to the number of orders remaining unexecuted at the beginning of the period. One large order, running into about £1,000,000, for the supply of electric railway equipment for the South African government, it had been fortunate enough to secure during the current year in face of severe competition both from the Continent of Europe and America. In regard to prospects, the troubles were industrial disputes and the chaos of foreign exchanges. In the company's works, however, there was a continuance of harmony between the management and the workers. The output of the works had been the largest during the history of the company.

Genoa-Modane Operation Begun

Late press reports forwarded by the Commercial Attaché of the United States Department of Commerce in Rome, Italy, state that on March 20 last the first electric train was run on the Genoa-Modane route, the transportation being most successful. This line, which is 272 km. in length, is the longest single electrification in Europe. The journey from Genoa to Turin will be shortened by an hour as the result of this improvement. It is hoped within the next six months to complete the electrification of the line from Pisa to Genoa, which will greatly add to the comfort of that trip, now made disagreeable by reason of the numerous tunnels.

New Electric Railway in Poland

Commerce Reports for April 24 states that the construction of a new electric railway between Lodz and Tomaszow in Poland is to be started soon. Information can be obtained from F. W. Artport, Warsaw.

Seven Weeks Supply of Coal on Hand

In an analysis of the coal situation issued this week the coal bureau of the Natural Resources Production Department of the Chamber of Commerce of the United States calls attention to the general lack of demand for coal supplies. At the present rate of production and consumption there is no danger of any general shortage, says the bureau, for at least six weeks.

On April 1 the stock of coal in the hands of railroads, industrial consumers, public utilities and retailers was approximately 63,000,000 net tons. Adding to this 4,250,000 tons estimated at the Upper Lake docks and the unbilled coal on hand April 1 there was a total of 68,650,000 net tons above ground April 1. Stocks cannot drop below 20,000,000 tons without danger of a coal panic. The quantity of coal which apparently can be drawn from stocks before a serious situation develops is 48,650,000 tons. To this supply there will be continuously added the output from the non-union fields, which up to date has averaged about 3,500,000 tons per week. At the present time the average weekly consumption is estimated to be 8,100,000 tons. Therefore, supply from the non-union fields is falling short of meeting the consumption 4,600,000 tons per week. To cover this deficit, we have the 48,650,000 tons in storage. If the consumer continues to draw from this storage at the rate of 4,600,000 tons per week, unless there is an increase in production from the non-union fields, a shortage will be felt in approximately seven weeks.

ELECTRIC RAILWAY MATERIAL PRICES—MAY 2, 1922

Metals—New York

Copper, electrolytic, cents per lb.	13.00
Lead, cents per lb.	5.25
Nickel, cents per lb.	36.00
Zinc, cents per lb.	5.325
Tin, Straits, cents per lb.	31.25
Aluminum, 98 to 99 per cent, cents per lb.	19.10
Babbitt metal, warehouse, cents per lb.:	
Fair grade	30.80
Commercial	15.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$5.05
Somerset mine run, Boston	2.80
Pittsburgh mine run, Pittsburgh	....
Franklin, Ill., screenings, Chicago	3.00
Central, Ill., screenings, Chicago	2.00
Kansas Screenings, Kansas City	2.675

Track Materials—Pittsburgh

Standard Bessemer steel rails, gross ton	$40.00
Standard open hearth rails, gross ton	$40.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	2.25
Tie plates (flat type), cents per lb.	1.75
Angle bars, cents per lb.	2.40
Rail bolts and nuts, Pittsburgh base, cents, lb.	7.00
Steel bars, cents per lb.	1.60
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	1.35

Hardware—Pittsburgh

Wire nails, cents per lb.	2.40
Sheet iron, (24 gage), cents per lb.	3.00
Sheet iron, galvanized, (24 gage), cents per lb	2.70
Galvanized barbed wire, cents per lb.	3.05
Galvanized wire, ordinary, cents per lb.	2.25

Waste—New York

Waste, wool, cents per lb.	13.00
Waste, cotton, (100 lb. bale), cents per lb.:	
White	10.00
Colored	9.00

Paints, Putty and Glass—New York

Linseed oil, (5 bbl. lots), cents per gal.	93.00
White lead, (100 lb. keg), cents per lb.	12.25
Turpentine, (bbl. lots), cents per gal.	92.00
Car window glass, (single strength), first three brackets, A quality, discount*	85.5%
Car window glass, (single strength), first three brackets, B quality, discount*	86.5%
Car window glass, (double strength, all sizes, A quality), discount*	85.0%
Putty, 5 lb. tins, cents per lb.	4.75

*These prices are f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb.	14.25
Rubber-covered wire, cents per lb.	5.90
Weatherproof wire base, cents per lb.	15.50

Paving Materials

Paving stone, granite, 4 x 8 x 4, f.o.b. Chicago, dressed, per sq.yd.	$3.20
Common, per sq.yd.	3.00
Wood block paving 3½, 16 treatment, N. Y., per sq.yd.	2.17
Paving brick, 3½ x 8½ x 4, N. Y. per 1,000 in carload lots	49.50
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.75
Cement, Chicago consumers net prices, without bags	1.97
Gravel, ¾-in., cu.yd., N. Y.	1.75
Sand, cu.yd., N. Y.	1.00

Old Metals—New York

Heavy copper, cents per lb.	10.00
Light copper, cents per lb.	8.625
Heavy brass, cents per lb.	5.375
Zinc, old scrap, cents per lb.	2.75
Yellow brass, cents per lb (heavy)	4.875
Lead, heavy, cents per lb.	4.56
Steel car axles, Chicago, net ton	$15.75
Old car wheels, Chicago, gross ton	19.75
Rails (short), Chicago, gross ton	16.00
Rails (relaying), Chicago, gross ton	15.75
Machine turnings, Chicago, gross ton	6.50

Digitized by Google

Order for German Material Not Confirmed

The question of ordering tramway material from the Continent of Europe instead of from British manufacturers has again been acutely raised by the action of the Edinburgh Corporation Tramways Committee. As stated in these columns in the issue for April 22 the committee recommended acceptance of a tender from a German firm. Much local indignation was aroused by this action as it is recognized that in the present state of exchange with Germany it is absolutely hopeless for British manufacturers to quote as low as the Germans. When the recommendations came before the Town Council on April 6, the Council declined to confirm them. Instead, it awarded the contract for rails and fishplates to Dorman, Long & Company, Middlesbrough, and for steel poles to Stewarts & Lloyds, Glasgow.

Increased Demand for Electricity

The average daily production of electricity in kilowatt-hours by electric public utility plants in March was less than that for February by a little more than 1 per cent. The average monthly output for each of the past five months is as follows: November, 121,300,000; December, 123,200,000; January, 123,200,000; February, 123,800,000; and March, 122,500,000. These figures show that there has been but little change in the average daily production of electricity by public utility plants since November, 1921, and indicate, as was pointed out in last month's report, that the normal seasonal decrease in output during the late winter and early spring months is apparently being replaced by an increase in the demand for electricity.

Rolling Stock

San Francisco, Napa & Calistoga Railway, Napa, Cal., is in the market for one steel express car body.

Wisconsin Valley Electric Company, Wausau, Wis., expects to purchase one set of double trucks and four motors for work car and snow plow.

Los Angeles (Cal.) Railway has received fifty Westinghouse D.H 16 air compressors to replace older compressors now used on its rolling stock.

New Orleans Railway & Light Company, J. D. O'Keefe, receiver, New Orleans, La., will purchase 100 new street cars at an approximate cost of $1,000,000.

Ashtabula, Ohio.—The City of Ashtabula will take over the operation of the Ashtabula Rapid Transit Company, and plans among other betterments to purchase six safety cars.

City Railway, Dayton, Ohio, is burning piecemeal fifty single-truck cars. The company plans to refinish and remodel fifty-six double-truck street cars now in operation. The passenger capacity will be increased to at least fifty-two persons. The cars now seat not more than forty-eight.

Buffalo & Lake Erie Traction Company, Erie, Pa., has received twelve Birney safety cars which are the first of an order of twenty-five purchased from the J. G. Brill Company. They are to be placed in operation on the Twelfth Street Crosstown line.

Public Service Railway Company, Camden, N. J., has launched its power-saving campaign with the use of Arthur power-saving recorders. The equipment of the Riverside line practically completes the installation of recorders on all cars except those operated by one man.

Los Angeles (Cal.) Railway has ordered fifty more cars of its 1200 type, designed for operation in two-car trains. The cars will cost approximately $14,500 each. The bodies and trucks will be built by the St. Louis Car Company. Delivery of the first twenty-five is promised for the first of September.

Frankford Elevated Railway, Philadelphia, Pa., will receive sealed proposals for 50 steel passenger cars, complete with all equipment (Contract 660) at the director's office, Department of City Transit, 1211 Chestnut Street, Philadelphia, until 12 o'clock noon, Thursday, May 25, 1922, and opened immediately thereafter.

Interborough Rapid Transit Company of New York has been directed by the New York Transit Commission to purchase 350 cars. The first order of 100 is to be placed immediately with delivery as soon as possible. On Aug. 1 the company is directed to place a further order for fifty cars, and the final order for 200 cars must be placed within six months after the contract is let for the construction of work remaining to be done on various shops and yards.

United Electric Railways, Providence, R. I., has received and begun operation with twenty-five safety cars purchased from the Osgood-Bradley Car Company. The company is also considering the purchase of a number of double-truck one-man cars and expects to be in the market for four double-truck snow plows and a snow sweeper.

Market Street Railway, San Francisco, Cal., during the nine months from April 1, 1921 to Dec. 31 in addition to the general maintenance work on its cars, built the remainder of the twenty new cars of the 266 type and equipped them with new General Electric 247 motors. These cars are in operation on the main lines of the system.

Western Ohio Railway Company, Lima, Ohio, has purchased ten cars from the J. G. Brill Company at a cost of $11,500 each. These cars are 45 ft. long, and 8 ft. 6 in. wide. They will have three compartments—arranged for baggage, smoker and ladies' compartment. The seating capacity will be forty-eight. General Electric 35-hp. motors and air-brake equipment will be used.

Track and Roadway

United Electric Railways, Providence, R. I., will undertake extensive track renewals over the entire system during the coming summer.

Kingston, Portsmouth & Cataraqui Electric Railway, Kingston, Ont., expects to rebuild ½ mile of track in paved street with 90-lb. A. S. C. E.

Salina (Kan.) Street Railway expects to rebuild about ½ mile of track. This will be laid in concrete. New rails will be used for approximately 800 ft.

Market Street Railway, San Francisco, Cal., from April 1, 1921, to Dec. 31 inclusive reconstructed 25,000 ft. of single track with standard 9 in. rails.

Ashland Light, Power & Street Railway, Ashland, Wis., expects to relay tracks between Ninth Avenue West and Seventh Avenue East, a distance of sixteen blocks.

New York State Railways, Rochester, N. Y., has just ordered ten hand-throw lever switches for installation on its tracks, over which heavy interurban cars operate.

Knoxville Railway & Light Company, Knoxville, Tenn., expects to place during the next thirty days orders for material to rebuild about 3½ miles of single track and to pave the same.

Sterling, Dixon & Eastern Electric Railway, Dixon, Ill., is rehabilitating its track between Dixon and Sterling, a distance of 14 miles. It is also reconstructing its tracks on city lines in Sterling.

Wisconsin Valley Electric Company, Wausau, Wis., expects to rebuild on account of paving about 1,000 ft. of track with material on hand. An order has been placed for one turnout with the Buda Company.

Knoxville Railway & Light Company, Knoxville, Tenn., expects to rebuild its lines on Sixth Avenue from Albert Place to Washington Avenue and beyond. The entire roadbed will be torn out and a new one installed.

Illinois Central Electric Railway, Canton, Ill., expects to build 1,400 ft. of track to be changed from the main streets in the City of St. David and to run parallel with the tracks and on the right of way of the Chicago, Burlington and Quincy railroad.

Los Angeles (Cal.) Railway has started the work of centering the tracks at the east end of the Stephenson Avenue line. The track will be reconstructed and pavement installed. Between Rampart and La Fayette Park on West Second Street, 116-lb. girder rail is being installed.

New York, N. Y.—The Board of Estimate has approved three contracts for subway construction involving an appropriation of $212,444. Two of these contracts are for work on the Fourteenth Street-Eastern District subway and the other for track installation in the Interborough yards at Livonia Avenue, Brooklyn.

Digitized by Google

Interborough Rapid Transit Company, New York, N. Y., will require additional car yards and inspection facilities to comply with the recent order of the Transit Commission for increased service. It is planned to provide temporary yards and sheds to take care of the first order of cars.

St. Louis, Mo.—Several industrial organizations have presented a petition to the United Railways, St. Louis, Mo., asking the company to extend the Natural Bridge trolley line from its present terminal at King's Highway and Natural Bridge Avenue to Pine Lawn. The Chamber of Commerce and twenty-nine industrial companies are asking for the extension.

Southern Indiana Gas & Electric Company, Evansville, Ind., will start work on street improvements just as soon as weather conditions permit. Workmen have begun to repair tracks and brick paving in Main Street. Among the improvements to be started soon will be the laying of double tracks along Walnut Street from Lafayette to Canal Street.

Montreal, Que., Aldermen recently indorsed the executive committee's report recommending the building of a mountain tram line into Mount Royal Park by the Shakespeare Road. This line would connect with the eastern and western sections of Montreal. The committee also recommended that a demand be made on the Tramways Commission for the establishment of the line.

International Railway, Buffalo, N. Y., has been opposed in its plan to double track its line in Goundry Street, North Tonawanda by Mayor Carl F. Drews. President H. G. Tulley of the railway announced that the company wished to make this change, before the old Niagara Falls cars were routed through that street, following discontinuance of trackage in Sweeney Street and Payne Avenue.

San Francisco (Cal.) Municipal Railway construction on the Taraval Street and Masonic Avenue extensions is not to be interrupted, according to a recommendation of joint public utilities and finance committees of the Board of Supervisors. The Ocean View and Sunset extensions will be held up for the time being. Engineer O'Shaughnessy is preparing a new report on the cost of the Ocean View extension. Work on the Duboce Avenue route is being held up until the engineer can make a financial report.

Princeton, Ind.—Lawrence Lyons, director of Indiana state highways, and George J. Nattkamper of Terre Haute propose to construct a traction line from Princeton to the coal fields east and southeast of that city. The line would operate coal and miners' trains. One plan suggested is that the proposed electric line might connect with the Chicago & Eastern Illinois Railroad setting cars for haulage over the main line to Chicago. This would give the Chicago & Eastern Illinois connection with the Oakland City and Francisco fields. No definite action was taken by the Chamber of Commerce.

Orleans-Kenner Traction Company, New Orleans, La., may be extended from its present terminus near the St. Charles Parish line to Sarpy, 16 miles distant. This would give a mileage of 32 miles. The country traversed by this suburban route is largely devoted to truck farming, most of which produce is shipped to New Orleans for sale and consumption. A number of manufacturing plants have found desirable sites along the road, whose volume of business has grown to very respectable proportions, and is constantly on the increase, hence the movement to extend the road along the river front.

Power Houses, Shops and Buildings

Detroit United Railway, Detroit, Mich., is building an extension to its Highland Park repair shop.

Southern Indiana Gas & Electric Company, Evansville, Ind., expects to purchase one 7,500 kw. turbo-generator with boilers of 1,000 hp. capacity together with the necessary coal handling machinery.

New York, N. Y.—The Board of Estimate has voted $4,000,000 for immediate commencement of work on the Staten Island freight and passenger tunnel between South Brooklyn and St. George.

United Electric Railways, Providence, R. I., are remodeling their power house and installing new equipment. An order has been placed with the General Electric Company for one 15,000-kw. turbo-generator and a 2,000-kw. rotary converter, transformer and switchboard. A Westinghouse condenser has also been ordered, and equipment for burning pulverized coal, together with additional boilers, will be ordered later.

The Ohio Public Service Company, Mansfield, Ohio, is contemplating building a new power plant on the Ohio River to supply power to the whole system. The system will include the cities of Warren, Alliance, Massillon, Mansfield, Ashland, Elyria and Lorain, which are expected to be connected by a high-tension line to be built within a few years.

Indiana Service Corporation, Ft. Wayne, Ind., has begun condemnation proceedings for the purpose of securing the real estate necessary for the construction of a station for the accommodation of the employees of the General Electric Company who use city street cars. Notice of the company was called to the fact that several thousand employees of the General Electric Company use these cars daily, with no protection from bad weather. The location is such that cars can be loaded and unloaded on a switch without interfering with traffic on the Broadway line.

Trade Notes

J. E. Coonan, agent for railway supplies, has announced the removal of his office effective May 1 from 135 Broadway to 149 Broadway (Singer Building), New York City.

T. McGahan and **H. W. Renick** have taken over the Magnetic Signal Company of Los Angeles and will continue the manufacture of the Magnetic flagman and their new Simplex relay. Mr. McGahan is vice-president of the Joy Tarbell Lumber Company, Chicago, and Mr. Renick former manager of sales of the Elliott Frog & Switch Company of St. Louis.

Westinghouse Electric & Manufacturing Company, announces a reorganization of the Supply Sales Department and the establishment of a Merchandising Sales Department. J. J. Gibson is made assistant to the vice-president; A. A. Brown is appointed manager of syndicate operations; J. S. Tritle is appointed manager of the Merchandising Sales Department; T. J. Pace is manager of the Supply Sales Department; C. E. Allen is made manager of the St. Louis office, succeeding Mr. Tritle; George Bailey is supervisor of distributing agents; M. C. Morrow is made assistant to the manager of the Merchandising Sales Department, and J. J. Dorney will become assistant to the manager of the Merchandising Department.

New Advertising Literature

Irving Iron Works Company, New York, N. Y., in its No. 8 sheet Vol. 55 describes the Irving Subway, its fireproof ventilating flooring.

The Cutter Company, Philadelphia, Pa., has recently issued a booklet descriptive of its circuit breakers as applied to the protection of electrical machinery and assorted machinery in central stations.

The Griscom-Russell Company, New York, N. Y., has just published bulletin No. 904 describing their multiwhirl coolers, which are used for the cooling of oil and water in connection with Diesel engines.

Magnetic Signal Company, Los Angeles, Cal., has just published a catalog of Magnetic wig-wag crossing flagman and signal accessories. Complete information is given regarding the construction and operation of equipment of this kind.

Sprague Electric Works, New York, N. Y., has recently issued Bulletin No. 48,717 descriptive of its motor drive and central system for newspaper presses. The fifteen-page booklet contains some interesting illustrations of Sprague specialties for newspaper offices in the composing room, jobbing department and stereotyping department.

The Uniqueness of Automatic Switching in Substations

WHEN asked recently why his company had adopted automatic control for its substations, an engineer said that starting and stopping a rotary converter by hand was becoming too expensive. The local records showed that in six years the cost of performing this simple function had increased more than 300 per cent. This was not deduced by means of a theoretical calculation; the figures were taken from the ledger. There was no possible gainsaying them. The answer was, of course, automatic control.

The increase in cost in this case was not due entirely to a higher wage rate. There were accompanying changes in working conditions which were also expensive. The net result, however, was as given. And there was no increase in output per employee to compensate for the increased cost; it was a sheer addition to operating expense. The fact is that the actual output of a substation operator is small anyway. If everything is going well he has practically nothing to do. Alertness and resourcefulness are really what he is paid for, and these qualities are seldom called into play.

Here the automatic control steps in, with the unique quality of always being on the alert and always, or nearly always, knowing exactly what to do. The attention of the best of human operators will sometimes lapse; that of the control relay (if in good working order), never. And automatic control does its work at a considerable money saving.

The references made above to good order of automatic equipment is not an aspersion on its qualities. They connote simply good maintenance. Automatic equipment cannot be installed and then forgotten; it needs intelligent and consistent care. Given this, it will make good.

The New York Situation Looks Better

ELECTRIC railway conditions in New York City are better, and this fact is being reflected in the higher quotations for all traction securities. The improved condition is also shown by the acceptance by Mr. Hedley for the Interborough Rapid Transit Company of the order to that company by the commission to purchase immediately 100 of the 350 more cars which the commission estimates are necessary to supplement the present service.

The latest figures published on the recent earnings of the Brooklyn Rapid Transit Company are for the nine months ended March 31. The net income for this period, after payment of interest, sinking fund, etc., was $2,012,041 against a deficit of $5,386,349 for the previous similar period. This showing has been reflected in the doubling of the quotation for the stock.

The better condition on the Interborough Rapid Transit system is due principally to the plan of readjustment of the finances of the three interested companies, dated May 1, 1922. These companies are the Interborough Rapid Transit Company, the Manhattan Railway Company and the Interborough-Metropolitan Company and its successor, the Interborough-Consolidated Company. From a financial standpoint, the situation is complicated by guarantees and leases extending for long periods, bonds issued with stock collateral, improvements made by a lessee to the property of the lessor, city contracts, city participation in profits, etc. A receivership for the immense Interborough Rapid Transit Company afforded always a possibility for a solution, but as explained in an editorial in the issue of this paper for April 8, this would have meant a loss for every one concerned, including the public. Fortunately it was possible to secure unity of action without this final recourse.

The agreement reached calls for sacrifices, but these seem to be proportioned in accordance with the equities in the properties at present, and wisely so, rather than on conditions as they were supposed to exist fifteen or twenty years ago. For a guaranteed stock the Manhattan stockholders secure what amounts practically to a cumulative lien on the net earnings of the present Interborough system, beginning at 3 per cent the first year and increasing to 4 per cent and then to 5 per cent, with possibilities of increased dividend rentals of 1 or 2 per cent more later, after the full dividend is reached, if the Interborough earnings permit it to pay more than 4 per cent or 5 per cent itself.

The stockholders of the Interborough Rapid Transit Company in turn agree that no dividend shall be paid them before July 1, 1926, nor until all cumulative dividend rentals at the rate provided be paid with all other charges upon the Manhattan property and to limit their own dividends in any year to 7 per cent up to July 1, 1950, with other adjustments and concessions for the benefit of the Manhattan stockholders. At the same time the holders of the Interborough secured convertible gold notes due on Sept. 1, 1922, agree to extend these notes for ten years, while the holders of the Interborough refunding 5s consent to a postponement of all sinking fund installment for five years beginning Jan. 1, 1921.

A provision for a wider participation in the management of the company is made by the clause which declares that while one-half of the directors of the company shall be elected by the stockholders, the other half may be elected or appointed by either the Transit Commission, or the city of New York, or the Manhattan company or the holders of the first and refunding 5s in proportions to be determined later by the reorganization committee.

Holders of the Interborough-Metropolitan Company collateral trust 4½ per cent bonds (secured by Inter-

Digitized by Google

borough Company stock originally pledged at the rate of $500 in stock for each $1,000 bond) may participate in the plan by purchasing a certain proportion of the new ten-year notes or by surrendering another proportion of their bonds, and holders of the Interborough stock (of which about $1,000,000 is still in the hands of the public) are placed on a similar basis.

It is estimated that during the next four years the plan will supply total earnings available for arrears, improvements and betterments and other capital purposes of $19,491,500, besides paying the fixed charges and dividends on the Manhattan Company stock and $11,743,000 to the city, as its share of the surplus.

Street railways have this favorable situation. In growing cities, and practically all American communities are extending, there is constant need for additional transportation facilities. Oppressive measures can be adopted against a railway company for a time, but when the need for extensions becomes acute a more favorable treatment must be accorded if capital to build the new lines is to be secured. New York is in this position, and a program for seven subway projects to cost $218,000,000 was announced last week. This proposal should help to clear up the situation in regard to the existing roads.

Elimination of Tax-Exempt Securities Given Another Impetus

THE effect of the tax exempt security as a block to proper development of constructive industry, and particularly as one of the greatest impediments to the growth of public utilities in expanding to meet increasing demands for service, has been repeatedly commented upon in these columns. The peculiar condition arising from limitation of return on public utility investment, coupled with the freedom from taxation of public securities, has of course destroyed the greater part of the market for utility securities. Those who have suffered most have been the utility customers, the public, either through necessarily increased cost of service forced by increased cost of money or through a lack of expansion of utility service to meet the demands and needs of the public.

It is very gratifying, therefore, to note that the ways and means committee of the House has reported favorably the Green resolution for a constitutional amendment which would prohibit the issue of any more tax exempt government—municipal, state or federal—securities. Representative McFadden has also long pressed this idea in the House; Senator Smoot has done the same in the Senate; it will be recalled that President Harding made a recommendation to this effect in his message; and, as the report of the committee shows, Secretary Mellon and other officers also urge such action.

With this resolution thus favorably before Congress, there is more hope than ever that Congress will take the necessary action to place this question before the several state legislatures. That there will be sentimental arguments of states' rights and of hampering the development of good roads, of public building operations, and so on, may be expected. These, however, are not sound arguments as has been repeatedly shown. Constructive development is what makes for prosperity and makes possible public improvements. Those interested in such enterprises—and public utilities stand in the forefront—should not hesitate to do all possible to aid in the advancement and passage of this resolution.

Service at Cost Being Used at Memphis

SERVICE-AT-COST franchises are still in the making, and variations in them are limited only by the number of such franchises in existence. One of the latest to be put to the test of actual experience is that in Memphis, the results of which are recounted in this week's issue. Like most other franchises of its kind it has a barometer fund and a graduated scale of fares. Like a few others it has an incentive clause for economical operation. Unlike most if not all others it has a specified standard of service, namely, passenger car-miles per revenue passenger, set in the franchise at between 0.155 and 0.185. It is upon these variations probably that attention will principally be directed.

Taking the last-named point first there are undoubtedly certain advantages in having a definite standard where such a standard is reasonable. That this is so in Memphis seems to be indicated by the fact that the present standard, 0.1714 in January, 1922, is less than that in any year from 1906 to 1917, though it is higher than the average for 1918 or 1919. As expressed it has the objection that is independent of the size of the cars, but if there should be a material change in car size the standard would probably be modified. For this reason and because the average length of passenger ride is not the same in different cities, the Memphis figure is not necessarily desirable for any other city. In usual electric railway parlance this figure is expressed as its reciprocal, namely, in revenue passengers per car-mile. As thus expressed the standard for January would be 5.83.

The second most novel feature in the franchise is the incentive clause by which the return may vary between 6½ and 7½ per cent, depending upon the amount in the index fund. The basis for the extra return is of course the critical part of any incentive clause, and the difficulty in drafting any clause of this kind arises because there is no exact scale by which good management can be measured. Of course, the rate of fare, a basis often proposed, is not a proper measure of good management. While to the public it may seem at first sight reasonable that a company which charges a low fare should have a high rate of return and one which charges a high fare should have a low return rate, the rate of fare is determined by a great many factors besides the quality of management. In fact, a high fare is frequently caused by the high cost of materials and money, and to vary the rate of return inversely with the fare would often be to make the rate of return low when the company has to pay high for its money and materials and to make the rate of return high when money, transportation and materials are cheap.

If service-at-cost franchises are to increase, it is to be hoped that attention will continue to be given to the study of incentive clauses in spite of the fact that they are difficult to draw and from a financial viewpoint even the best is bound to have some element of weakness. That is to say, it is easily conceivable that in estimating the return on a property, a conservative lender of money might be more impressed with the way in which a hostile city administration could keep the return at the minimum figure in spite of good management rather than the possibilities which good management offers for securing the maximum return.

Measuring the Service in Memphis

Under a Service-at-Cost Plan the Memphis Railway Provides Measured Transportation According to a Standard Agreed Upon with City—Expenditures of All Departments Are Continually Controlled by Budget

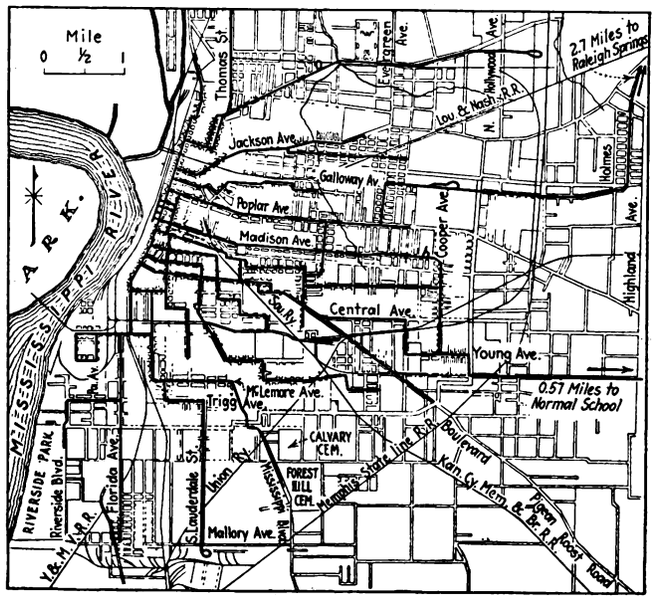
THE city of Memphis has had somewhat more than two years experience now with its street railway service-at-cost plan, in which transportation is furnished on a definite measure determined by a method developed by Ross W. Harris, consulting engineer, of Madison, Wis. In this measure, theoretically at least, each car rider, no matter where he may live, is getting his full money's worth. Daily checks are made to indicate that for the city as a whole and for each line the number of passenger car-miles furnished per revenue passenger is up to standard. Monthly checks are made to assure the railway management that all of its departmental expenditures are according to the budget planned far in advance.

The system is one which has so many novel and advantageous features from the standpoints of both city and company that it is worth while to analyze in detail the method employed.

STATE COMMISSION AUTHORIZED NEW FRANCHISE

It will be recalled that early in 1919, after extended hearings, the Tennessee Commission authorized the Memphis Street Railway to establish an emergency fare of 6 cents pending an appraisal of the value of its property. This appraisal was conducted by three experts, A. S. Richey of Worcester, representing the commission; J. H. Perkins of Birmingham, representing the company, and Ross W. Harris of Madison, Wis., representing the city. As a result of this appraisal the commission set the sum of $11,846,034 as that on which the company was entitled to fair return, and of this sum the cost of renewable property was $7,600,000. It was also found that from 1906 to 1917 inclusive the car-miles per revenue passenger had averaged 0.202, but later this ratio had fallen to 0.16, owing to the need on the part of the company to economize on service, difficulty in securing reliable employees and other conditions brought about by the war.

As a result of this investigation the commission on March 15, 1920, issued an order establishing as the sum on which a return should be allowed $11,846,034, plus such amounts as had been added and minus such amounts as had been deducted after July 1, 1919, in accordance with the accounting methods prescribed by the commission. It ordered the company to provide in the future a standard of service, which was that each month there should be "not less than 0.155 nor more than 0.185 passenger car-mile for each revenue passenger carried." It ordered the company to provide a renewal and replacement reserve which was to be 3 per cent annually of the investment in depreciable property until the reserve should reach the sum of $500,000, and thereafter whenever the reserve was more than $300,000 and less than $500,000, but it was to be increased to 4 per cent when the reserve was less than $300,000 and diminished to 2 per cent when the reserve was more than $500,000. The order also required the establishment of an injury and damage reserve and defined taxes as a part of the cost of service. It then established a fare-index fund and placed the permissible



MAP OF MEMPHIS SHOWING THE LINES OF THE MEMPHIS STREET RAILWAY

rate of return at not more than 7½ per cent nor less than 6½ per cent, the wording of the order in these respects and on the rate of fare being as follows:

RATE OF RETURN

Return on the investment shall be considered as a part of the cost of service and shall be allowed monthly at a rate per annum not more than 7½ per cent nor less than 6½ per cent. Such rate of return shall not be more than 6½ per cent during any month when the fare-index fund balance is less than $60,000. During each month when the fare-index fund balance is above $60,000, the return may be at any rate between 6½ per cent and 7½ per cent (inclusive) which the company may be able to pay out of the current revenues for such month, after paying operating expenses, charges to reserves and tax accruals, but without decreasing the fare-index fund balance below $60,000. Should earnings of the company during any month, plus the balance then in the fare-index fund, be insufficient to pay such minimum return as above described, then such deficit in return payments shall be paid from the earnings of succeeding months, plus accrued interest at the rate of 6½ per cent per annum, before any amounts are added to the fare-index fund.

FARE-INDEX FUND

The company shall establish a fare-index fund by crediting to such fund monthly all revenues after cost of service, as described herein, shall have been paid. Such fare-index fund shall be used to pay such deficits as may occur between revenues and the cost of service, and it shall also serve to determine the rate of return on the investments, as hereinbefore described, as well as to determine the rate of fare as follows:

Whenever on Jan. 1 or July 1, of any year, the balance in the fare-index fund shall be greater than $200,000 and shall have been increasing during the preceding two months, the rate of fare shall then be reduced to the next lower in the following list; whenever on Jan. 1 or July 1, of any year, the balance in such fund shall be less than $60,000 and shall have been decreasing during the preceding two months, the rate of fare shall be increased to the next higher in the following list. In the emergency that the fare-index fund continues to increase for two successive months after a decrease in the rate of fare, or continues to decrease for two successive months after an increase in the rate of fare,

Digitized by Google

then the commission may announce an emergency change in the rate of fare, and put into effect the next indicated rate of fare forthwith, without waiting for the succeeding regular date of Jan. 1 or July 1.

RATES OF FARE

The rates of fare which automatically may be in effect in accordance with the operation of the fare-index fund, as above described, shall be as follows:

No. 1—8 cents cash
No. 2—8 cents cash with ten tickets for 75 cents
No. 3—7 cents cash
No. 4—7 cents cash with ten tickets for 65 cents
No. 5—6 cents cash
No. 6—6 cents cash with ten tickets for 55 cents
No. 7—5 cents cash

Whenever fare No. 2 or fare No. 6, as listed above, shall go into effect in the operation of this order, the commission will extend this list either upward or downward, as may be necessary, and will make further additions from time to time, so that the list may always contain at least two rates of fare above and two rates of fare below the rate in effect at any time.

Under any rate which includes tickets, such tickets may be sold in even multiples of ten. Under any rate, children of five years of age and under may ride free if accompanied by a passenger paying the regular rate. Transfers shall be given under any of the rates of fare in continuance of the present practice.

The commission then established as an initial rate No. 4 of the rates given herewith or 7 cents with ten tickets for 65 cents, and engaged Mr. Harris to make a traffic survey to determine the standards on which the future transportation service of the company would rest. In this engagement the city of Memphis and the receivers of the Memphis Street Railway joined.

A full list of the fares charged in Memphis is as follows:

	Adopted
Fare No. 7—5 cents cash	original fare
Fare No. 6—6 cents cash with ten tickets for 55 cents	June 16, 1919
Fare No. 4—7 cents cash with ten tickets for 65 cents	Aug. 18, 1920
Fare No. 3—7 cents cash (no tickets)	Aug. 19, 1921

The report by Mr. Harris, which was presented to the utility commission, city and company on Oct. 30, 1920, and later approved by all parties, was an exhaustive study of the situation, made recommendations as regards routing and reduction of traffic congestion and outlined a system of service standards upon which present operation is based. After the completion of the report Mr. Harris, who acted as consulting engineer for the city, was retained jointly by the city and company with the approval of the utility commission in connection with the execution and operation of the plan.

TABLE I—MEMPHIS STREET RAILWAY—NORMAL DISTRIBUTION FOR FIRST FIVE MONTHS, 1922, AND FOR YEAR

Estimated expenses for first five months of 1922 and for the year, based on a surplus of $50,000 (see line No. 13). This is the bogey toward which the company works.

Based on (1) 7 Cent Fare; (2) 25.5 Cents per Car-Mile for Operating Expenses (Item 6)

	Per Car-Mile Cents	January	February	March	April	May	Year
1. Maintenance of way and structures	2.34	$14,562	$13,465	$14,848	$14,466	$14,978	$178,351
2. Maintenance of equipment	2.87	17,798	16,457	18,148	17,681	18,307	217,985
3. Traffic	.07	412	381	420	410	424	5,051
4. Conducting transportation	15.90	99,047	91,581	100,993	98,397	101,878	1,213,099

11. Interest on deficit	.....	1,087.51	.....	.....	1,087.51	100.00
12. Cost of service	268,809.00	257,186.81	11,622.19	4.32	.....	.....
13. Revenue from all sources	255,982.00	256,104.25	.....	.....	122.25	.05
14. Car-miles	622,069	621,267	802	13	.....	.....
15. Revenue passengers	3,627,129	3,620,425	6,704	.18	.....	.....

TABLE III—COMPARISON OF UNITS—ACTUAL WITH NORMAL

This is a comparison of units, actual with normal, for January, 1922. Figures are made up in this way for the month and for the year to date.

	—January— Normal Cents	Actual Cents	Year to Feb. 1 Normal	Actual
1. Item 6 per car-mile	25.5000	23.8638	Same as month	
Item 6 per revenue passenger	4.3733	4.0950		
2. Cost of service per car-mile	43.2121	41.3971		
Cost of service per revenue passenger	7.4111	7.1038		
3. Revenue from all sources per car-mile	41.1501	41.2229		
Revenue from all sources per revenue passenger	7.0574	7.0739		
4. Car-miles per revenue passenger	.1715	.1716		
Revenue passengers per car-mile	5.8308	5.8275		

TABLE IV—DAILY NORMAL LINE STANDARDS FOR JANUARY, 1922

This standard of service in car-miles per revenue passenger is made up as a guide for the company to follow during each month.

	Saturday	Sunday	Weekday	Month
1. Normal	0.1918	0.2117	0.2157	0.2110

Horace Johnson, City Commissioner of Public Utilities, is in active and constant touch with the city's side of the plan.

An important part of the franchise adopted was that relating to traffic standards. On this point, Mr. Harris' original report read in part as follows:

Traffic Check

As a guide to distributing service, regular periodic checks should be made during the rush hours of traffic on each route once each week, not including Saturday, and at least once a month on Saturdays and Sundays by a permanent force of trained inspectors. The information thus obtained should be compiled in permanent record for comparison, showing the traffic by twenty-minute periods, number of cars observed, maximum and minimum loads. These checks should be made at points listed as follows:

Main and Market, Third and Poplar, Madison and Marshall, Third and Beale, Main and Vance.

Line Standards

There should be determined for each route, just prior to the beginning of each month, a daily line standard that is seasoned with good judgment and policy and predicated on an equitable relation between fare, rate of cost, volume of business, physical conditions along each route, and the immediate future business outlook. These standards should be a guide for determining the total car mileage to be operated. This amount should not be exceeded in the schedule.

Such a system for determining line standards and distributing service, the details of which will be found in this report, should be put into effect at the earliest possible date. Fairness to the public and company and good business procedure demand it. There is no necessity to delay putting such a plan into effect on account of changes in car routing.

Design of Schedules

Every effort possible should be made to establish a system of flexible schedules that may be readily changed on short notice properly to compensate for current fluctuations of rate of cost and volume of business. Such schedules should be limited on one side by the readiness-to-serve element of service and on the other side by an equitable relation of the elements of cost of service. The daily car mileage over that required for readiness-to-serve service should be distributed proportional to traffic as to volume, length of ride and time of riding. The traffic thus referred to is that observed at points of maximum loading in excess of that accommodated by cars in readiness-to-serve service.

Later in his report, Mr. Harris expands this idea of fixing a standard of service at length, but fundamentally this is the hypothesis upon which the whole plan is based: "There are, thus, two ways to view the question of a standard of service, as follows: (1) Shall service be determined by the existing fare, or (2) Shall the fare be made adequate to meet the cost of service demanded by the public?"

The conclusion is that the standard of service must be predicated upon a consideration of both factors, namely,

service as limited by the cost and the fare, and service as fixed by public requirements. A description of the manner in which the operation is carried on will serve to indicate both the method which was finally agreed upon and the manner in which it is now working.

To start with, operating with past experience as a basis, an estimated budget for the year is produced by Mr. Harris after full conference with and approval by the operating officials of the company and the Commissioner of Utilities for the city, as a basis for the entire operations of the year. This budget is made up by months, and is known as "Monthly Normals." A copy of this estimated budget for the first five months of 1921 and for the year is shown in Table I. In this table as reproduced, only the car-mile figures for January are given, but in the actual form each item for each month is shown on a car-mile basis. As will be seen the figures for 1922 are based on the estimated cost of 25½ cents per car-mile. In 1921 the figure was 28 cents per car-mile.

At the end of each month, after the month's expenditure has been calculated, the management fills in the actual expenditure for comparison and check. The amounts actually expended are compared with the estimated, or normal expenses and the per cent, above and below are calculated, as shown in Table II, which is the record for January, 1922. The figures for later months are kept on a cumulative basis for the year, but this obviously is not shown in a January statement.

FIGS. 2 AND 3—UPPER PART OF DAILY EARNINGS STATEMENT KEPT BY LINES. SUMMARY OF PASSENGER SERVICE, IN WHICH COMPARISON IS MADE WITH "NORMAL" SERVICE

Digitized by Google

As soon as this estimate has been compiled for each month, a copy is submitted to the city, together with the comparison given in Table III, which shows the principal items on a car-mile and revenue-passenger basis, normal and actual, as well as the car-miles per revenue passenger and revenue passengers per car-mile, normal and actual.

On the basis of this monthly report and comparison, the standards of car-miles per revenue passenger and earnings per car-mile by lines for the next succeeding month are compiled. These are in the forms shown in Tables IV and V, which were drafted for January, 1922, in December, 1921. The great apparent differences in scheduled service between certain of these lines, when measured on a car-mile per revenue-passenger basis, are due to local conditions. For instance, the Riverside line, which shows by far the highest proportion between car-miles and passengers, operates only one car.

FIG. 4—DAILY REPORT TO CITY CONSULTING ENGINEER, BY LINES SHOWING VARIATIONS FROM THE NORMAL

THE SCHEDULE PREPARED FROM A BUDGET ALSO

With these standards before it the company has to build up its schedules. They are prepared on the basis suggested in Mr. Harris' original report, which is to take traffic counts at points of maximum load and allow an average in the morning and afternoon peaks of 60 per cent overload for large cars and 40 per cent for small cars, and of one-third of a load in non-rush hours.

From the number of seats thus determined it is possible to calculate the number of cars to pass that point, and from the length of run and schedule speed, the number of cars, number of trips and the number of car-miles can be obtained. With the number of car-miles and the number of passengers it is possible to calculate the measure of service—the car-miles per revenue passenger. If this comes out either low or high, the schedule is changed.

All stopping points for cars are marked by a "car-stop" sign on the span wire, and these signs are spaced eight to the mile in the business districts, six to the mile in the residential districts and four to the mile in the suburban districts. Since the adoption of this plan it has been possible to increase the schedule speed of the cars, which in the month of April, 1922, was 10.1 m.p.h.

From the route schedules determined in the way already described the run schedules are prepared. They are typewritten on the form shown in Fig. 1 and a copy is given to each crew. As will be noted, all divisions, runs, time-tables and stations are numbered.

TABULATION OF RESULTS

In operation, daily reports by routes and monthly reports by days are compiled. The upper parts of these blanks are reproduced in Figs 2 and 3. A daily comparison of the actual and equitable figures are also filed with the city on the form shown in Fig. 4, which gives the record for Jan. 31, 1922. This goes as a report to the City Commissioner, so that he can keep in daily touch with the service given. This record can be used to check complaints of the service on any particular line. It has been found that this one feature alone has aided materially in having the public gain a conception of the fact that it was getting its money's worth all of the time and that the city was keeping close watch upon the railway to see that the standard of service was continually maintained.

Of course, from this performance record it is possible to redistribute service when the record indicates that the service provided on various lines is either high or low. A franchise of this kind has been found in Memphis to be a great incentive to the operating force. The objective is clear, and each division and department feels it must do its part or fall behind. Weekly meetings of the traffic men and of all the operating officials permit opportunity for weekly checks.

Though a number of blanks used are not reproduced in this article, the accounting work required is not complicated. Only one man has been added to the accounting force to supply these data as compared with those formerly prepared. In recompense, the general superintendent is kept in daily touch with his system, whereas before it was very difficult to obtain actual figures until after eight or ten days. The system seems to be giving equal satisfaction to the public.

The theory of the system is such as naturally to bring about these feelings. Briefly it is that the city dictates the number of cars desired, though held down to certain limits so as to prevent extravagant service. The company carries out these orders in the most economical manner and its reward is proportioned to the economy which it exercises. The fare is only that required to pay operating expenses and a reasonable return on an investment already recognized by the city.

Boston Railway Reference List

A LIST of the literature on electric railway transportation in different cities in the library of the Boston Elevated Railway has been compiled by L. A. Armistead, librarian of that company. The references are complete as regards original reports, addresses and books contained in the library, but periodical literature is listed only when other references are lacking. The reason for this is that most technical periodicals issue indexes in which these references can be readily found. As a typical list, the following is given on Milwaukee:

Arnold, B. J., Dec. 1, 1910. Pittsburgh Transportation Problem. Reserves for depreciation, page 118. Low earnings per mile of track, page 130, etc.

Doolittle, F. W., 1916. Definition satisfactory service, page 207. Opinions as to comfortable load, page 201. Basis of valuation, depreciation, allowances and rate of return, page 451, etc.

The Baltimore Plan of Parking Regulation

How the Law Was Enacted—Co-operative Work of Railway Company and Automobile Club Educated the Citizens of Baltimore to See the Necessity of Automobile Parking Regulations in Order to Expedite Travel

BY JOHN E. CULLEN
Assistant to the President
United Railways & Electric Company of Baltimore, Baltimore, Md.

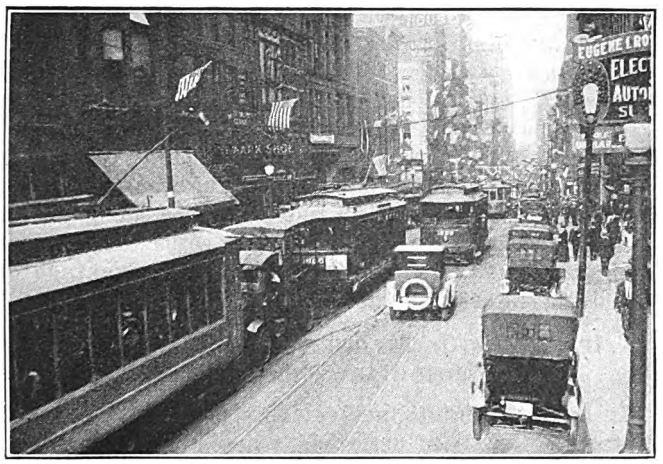
A GREAT DEAL has been said about "the Baltimore plan" for the regulation of automobile parking, but I have always doubted if we were the pioneers. I have understood that several cities tried out one or two parts of our plan before our law was passed, and so, at the outset, it must be understood that the object of this article is not to boast about "the Baltimore plan," but is more for the purpose of explaining its fundamentals, and, what is more important, how it became a law.

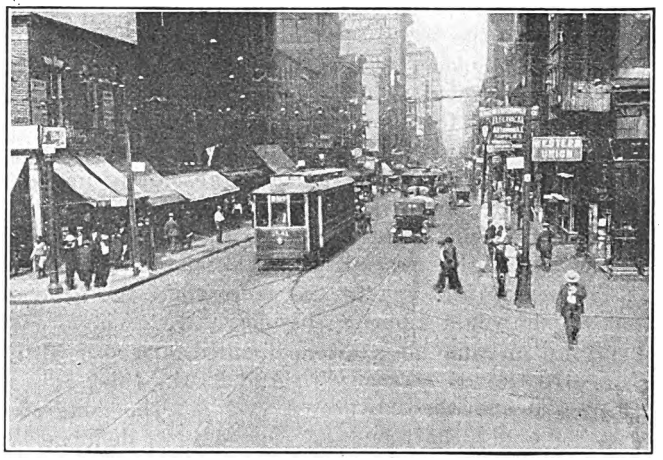
First of all, it was based on the assumption by the United Railways of Baltimore that the automobile was a great thing; that the citizens of Baltimore were entitled to own automobiles and that the automobile had a right to be on the street, even when it was standing still. And, then, it was based on the assumption by the Automobile Club of Baltimore that, as the street cars daily carried 900,000 persons, those people were entitled to a ride unimpeded except by necessary delays, and one of the unnecessary delays had as its sole cause the unrestricted and selfish parking of automobiles on certain streets at certain hours. It sounds rather sophomoric, perhaps, to state those two points and then, with the gesture of a man taking a rabbit out of a high hat, say, "and there you are."

But there we were—and it was the end of a long, long trail which stretched back to the days when the Baltimore street railways thought that the best solution of the automobile problem was to burn all automobiles, shoot all chauffeurs and make everybody ride on street cars, and the automobilists were for clawing up all the street car tracks and getting a smooth paved street, minus street cars, children, other people, other people's automobiles and speed cops.

This article is for a street railway man's magazine; therefore, I feel fairly safe in assuming that, except for some blessed saint among the general managers and the superintendents of transportation, all will not mind acknowledging this was their frame of mind. As for the automobilist, he will readily admit all I have said.

The Baltimore law was born in a period of repentance by both sides, and now that we are leading a life which is surrounded by the odor of unselfishness and sanctity —we would not change. It came about in this way: Late in 1918 we went through a hearing before the Public Service Commission on our petition for a 6-cent fare. The people's counsel for the commission, Osborne I. Yellott, was also counsel to the Automobile Club, and a pioneer automobilist. Mr. Yellott was recently killed in his machine and his death was a great shock to Baltimore. I am sure that Mr. Yellott, were he living, would not mind my saying that during the trial of the 6-cent case he gave our company one of the worst drubbings it had ever received, and, incidentally, complained of the slowness of our cars.





AT LEFT, LOOKING EAST ON BALTIMORE STREET AT EUTAW, SHOWING PARKED CARS. EVERY MOVING VEHICLE IS IN THE CAR TRACKS. THIS IS A "TWO-LANE" OF TRAVEL STREET AND EVERYTHING MUST MOVE AT 4:30. NO PARKING OF ANY KIND AFTER THAT HOUR. AT RIGHT, SAME VIEW AS AT LEFT, EXCEPT THAT IT IS 4:45 P.M. AND EVERYTHING IS MOVING

I am quite willing to agree that the company deserved all it got (including the raise in fare) and so it was with the confidence of a long friendship with Mr. Yellott and a knowledge of his fairness that I went to his office one day, soon after the close of the fare case, and said: "Let's try to get together on a parking law that will change this situation downtown and help speed up our service. You have attacked us on our slowness —let's see if we can start the reform by working out some answer to the parking problem."

At that time our cars crawled through the downtown streets, hemmed in on both sides by machines, many of them parked so carelessly that the motormen frequently had to get out and kick a wheel over the rail far enough for clearance. It was requiring twenty minutes to go eight blocks, and cars were hopelessly off schedule because of delays in the business district. Mr. Yellott's reply was entirely correct.

He said, "What's the use of trying to do business

Digitized by Google

with you fellows when you want to hog the streets and not let anybody else on them?" We were old friends, however, and we both had our own ideas about the selfishness of both sides. We agreed to meet a few days later. Meanwhile, I was to get *carte blanche* from my company to agree to anything and he promised to persuade the Automobile Club to accept whatever he agreed on. And this is what we finally worked out; and this is the spirit of the Baltimore traffic law.

THE INTERESTS OF THE MAJORITY SHOULD CONTROL

Ordinary delays caused the street car by the automobile, or the automobile by the street car, are all "in a day's work," and are to be accepted by each as a necessary part of the modern traffic situation. However, there are certain times when the *number of persons concerned* must be the determining factor and, using this basis, there could then be no doubt that in the home-going time in the evening a street car with eighty persons should not be impeded by an automobile with a few persons in it—and certainly not by an empty machine which awaited the pleasure and convenience of its owner or driver.

But, we decided, any law which gave this deserved preference to the street car riders should not be applied except at the places where it was needed and at the time it was needed. This was an obvious point. The parking law in force at that time prohibited parking lasting more than two hours. It was a poor law; was only enforced occasionally and was absolutely unnecessary on a large majority of the streets.

What Mr. Yellott and I were trying for was the kind of law which the man with the automobile could *see* was necessary and yet, at the same time, the kind of law which would remedy the downtown delays. We finally hit on what he afterward called, and very aptly, "the yardstick of necessity." And it was this:

First, define the downtown section; the congested area. We did that, and it was easy to define. We took the limits of the downtown section which was guarded by traffic police. There always is the surest method and we used it.

Second, we adopted what I have always thought was the soundest part of our plan. We said that on those streets which were wide enough to accommodate on each side a moving street car, a moving automobile and a parked automobile, exactly parallel with each other, there was no necessity for the prohibition of parking at any time. This meant that the street car tracks were for the free movement of street cars, and at the evening rush hour when cars were practically bumper to bumper the tracks were for the exclusive use of the street cars. It meant, also, that there was a moving lane of traffic to the right of the street car which was for the use of automobile and other traffic and that it was assumed that, except for unnatural delays, this lane would provide freedom and rapid transit for the automobile. In many cases the rate of speed achieved by the automobile in its lane of traffic is greater than that of the street car, as will be explained in a later article, when we get to the safety island part of the plan.

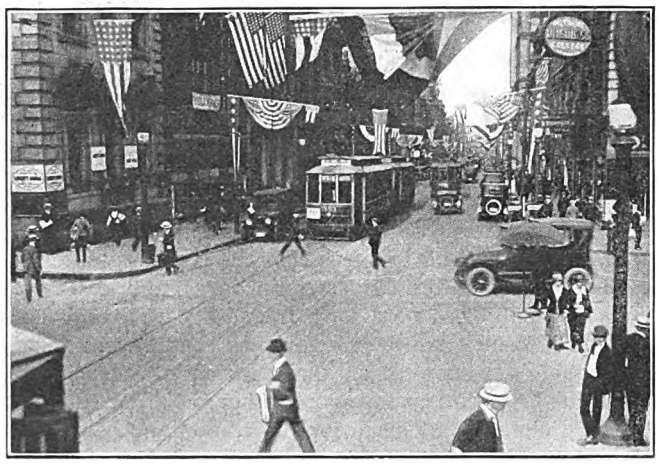
What Mr. Yellott and I had in our minds was that something had to be done to get the automobile out of the car tracks in the rush hour in the evening. Every street downtown was so littered with parked automobiles that on most of them there was only one open liquid lane of travel in either direction, and that was the space occupied by the car tracks. It was not an uncommon thing for street cars which should have been 5 ft. or 10 ft. apart to be separated by the space of sixteen automobiles, simply because nothing moved on those streets except in the car tracks.

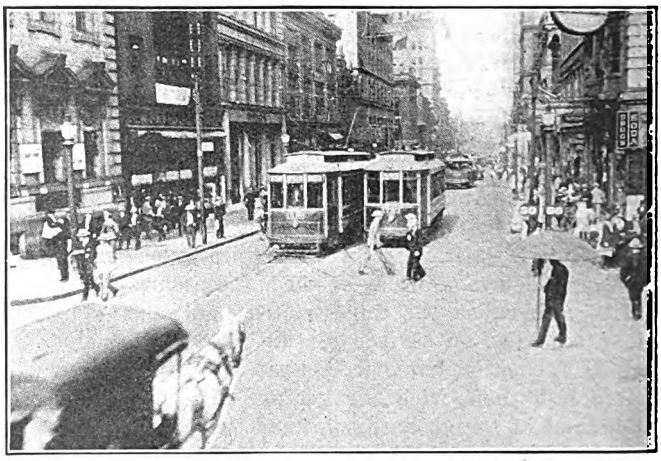
The disarrangement of schedules can be imagined. Cars on heavy lines which should have been forty-five seconds apart were limping along at the time interval of three or four minutes between them. What was visualized and what actually came true was that if we gave moving automobilists a clear space alongside of the car tracks they would not only cease to interfere with the street cars but would have the advantage of not being interfered with.

IF PARKING IS ALLOWED, A TIME LIMIT DOES MORE HARM THAN GOOD

It is important to note at this point that on such a street as has been described, where there is room on each side for a moving street car, moving automobile and parked machine, we not only did not prohibit parking, but we put no restriction on it whatever. This should be borne in mind in the making of any parking law; that if there is no obvious necessity for prohibiting parking, then such a prohibition is not only foolish but hurts the entire cause of traffic regulation.

I have often doubted the wisdom of laws which fix one and two hours as the limit for parking. They are



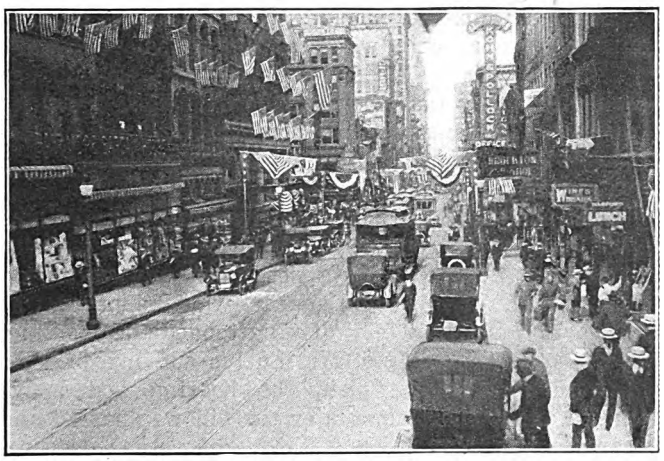


AT LEFT, LOOKING EAST ON BALTIMORE STREET AT LIGHT STREET. CARS PARKED ON SIDE LEAVE ONLY LANE OF TRAVEL FOR ALL TRAFFIC. AT RIGHT, SAME AS AT LEFT, ALL PARKING OVER, AND STREET IS CLEAR ON RIGHT FOR AUTOMOBILE TRAFFIC. TIME 4:40 P.M.

Digitized by Google

very difficult in enforcement and, so far as the street railway man is concerned, I personally think that the parked automobile is better for us when it "stays put," rather than having it jump in and out of traffic every half hour. Certainly it is more important that during the evening rush hour everything move than it is to have constant moving during the day.

Still applying the "yardstick" of necessity and what seemed to us a very sound reason, we determined that, on all streets in the congested district where there were only two lanes of travel on either side of the



LOOKING EAST ON BALTIMORE STREET FROM HOWARD STREET. EVERYTHING IN THE CAR TRACKS

THERE IS A CLEAR PATH TO THE RIGHT FOR THE USE OF THE AUTOMOBILE

street, beginning at 4:30 p.m. everything on that street must move. That meant that automobiles could park there all day long if they desired, but at 4:30 the car tracks were for moving street cars, and the travel lane to the right of the car tracks was for moving automobiles and other vehicles. On such a street as this, even one parked machine in any block would immediately force all moving traffic into the street car tracks. Having arrived at this general agreement, we started to apply the principle to the map of the congested area.

First of all we exempted all streets on which there were no car tracks. There are streets, of course, where there are no tracks, which are so narrow that parking is dangerous, but we left those to the general authority of the police department, which under the public safety laws has plenty of authority to regulate the parking on such streets. This law was to be one of absolute necessity, and we left to the police department the job of judging the necessity on trackless streets. Then block by block where there were tracks we applied the yardstick, first for width and then for that other and tremendously important factor—"the time parking should not be allowed."

And the reason why that is important is because on some of the streets which were narrow there was absolutely no sense in prohibiting parking up until the evening rush hour, when the number of street cars passing through that street is suddenly tripled and the number of automobiles augmented in probably the same ratio. In other words, there were many blocks where parking during the day did not interfere with our cars in the slightest way—so we asked for the prohibition only when it was needed.

Then we had to determine the hours of necessity. This was very important and as we found afterward was to give us the greatest amount of trouble. We fixed on them from 4 p.m. to 7 p.m., with the idea that 4 p.m. was probably a little too early, but by that time both Mr. Yellott and myself were so enthusiastic that we were making concessions to each other and trying to build what we thought was an ideal law.

And so he wrote the law. Since his death I have had brought back to my mind how splendid he was and how interested he was that afternoon when we went over the map, block by block, and determined how we would stand.

We each had a fairly easy time with our own people. The Automobile Club, which invariably accepted his judgment, had the added advantage of a president and secretary who were broad-gaged leaders; who saw that some change must be made in the parking situation and who were far-sighted enough to see that if the selfish motorist was allowed to clog up the main highways of travel for 900,000 persons, they would ultimately bring down upon all of the decent motorists laws which were too harsh and certainly undeserved. John S. Bridges, the club's president, and H. M. Lucius, the secretary, immediately threw themselves into the fight for the passage of the Yellott law and never wavered in their determination to co-operate with us to solve a difficult problem.

EVERYBODY AGREED TO THE LAW BEFORE IT WAS PRESENTED

Thomas A. Cross, who was then president of the United Railways, and Herbert B. Flowers, our general manager, both agreed to the Yellott bill and it was with the encouragement of this reception that Mr. Yellott and I determined to attempt what had never been attempted before on such a law; that was to get every one concerned to agree on its provisions before it was presented to the City Council and thus insure its speedy passage and preserve its original form.

We were in for "breakers ahead" before long, but the result justifies the declaration that this is the only practical method of passing such a law, and, what is more important, having it enforced.

We submitted the proposed law to the Merchants and Manufacturers' Association, the Retail Merchants' Bureau, the Charles Street Merchants and the Automobile Club executive committee. From the start the real fight developed on the hour at which the parking prohibition would become effective, and 4 p.m. was unanimously attacked by the merchants affected. They said that if persons owning automobiles could not park

Digitized by Google

on certain downtown streets after 4 o'clock, the business of the stores would practically be over at that hour, while the closing hour at that time was 5:30.

This was complicated by the fact that in one portion of the shopping district the streets were wide enough to escape, by our yardstick method, any prohibition of parking; while on others, where were located some important stores, the streets were narrow and the no-parking rule was badly needed. Such a condition made the merchants in the proposed "unlimited parking" area very self-conscious, particularly after some of the not-so-level-headed merchants started rumors that we were trying to favor the other side. These rumors made the unaffected merchants get into the fight so as to prove their allegiance to the Retail Bureau, and for several weeks things looked very dark indeed.

It is a pleasure to record how splendidly the Automobile Club acted in those bad days. Mr. Yellott by this time was busy on other things, but Mr. Bridges and Mr. Lucius, aided by several members of their board, continued the fight and every effort which was made to get the Automobile Club to desert us only made these gentlemen stronger in their faith in the proposed law.

Finally Mr. Yellott and I agreed that it would be proper for us to compromise with the merchants by changing the hour of parking prohibition from 4 p.m. to 4:30 p.m. When this was announced to the merchants, many of them realized that it was all that could be expected from us and, except for several "bitter-enders," we from that time on had them with us. We were careful to explain that, beginning at 4:30 p.m., our tracks downtown were saturated with street cars which were moving according to schedule and getting into position where they would play their part in the evening rush hour.

It was difficult for the merchants at first to see that car-peak came before passenger-peak—that is, that we had our cars on the tracks before the opening of the actual passenger-peak. This meant that the time between 4:30 and 4:45 would witness a considerable traffic peak because of automobiles which would pull out of berths on restricted streets. This would give us only a few minutes before 5 o'clock in which to get the downtown traffic moving freely on all possible lanes of travel. Obviously, if the law did not become effective until 5 p.m., the vehicular-peak coupled with the passenger-peak would make an impossible situation. We informed the merchants if the time was fixed at 5 p.m., we would have to fight against its adoption, knowing as we did that it would hurt instead of help.

All of these statements were accepted as true, and while some of the more obdurate merchants were for killing the whole plan, the Retail Merchants' Bureau, which also had splendid leadership, voted by a considerable majority to approve the plan. The other associations did likewise.

Only one other point had come up which might be of interest to readers of this magazine. I have spoken of the difficulty of enforcing the one and two-hour limit of parking. Both Mr. Yellott and I were puzzled to devise some scheme that would make a law self-enforcing, and we finally hit on a plan of placing on our trolley poles signs which told the automobilist exactly when he could and could not park. This idea was written into the law and it meant that a person about to park an automobile had only to look at the nearest trolley pole and if there was no sign on it he knew he could park there as long as he liked. If, on the contrary, there was a sign, it told him exactly what the regulations were.

We used the same idea also in enforcing another portion of the law which prohibited the parking of an automobile within 50 ft. of any crossing where a street car stopped to take on or discharge passengers. This was done so as to eliminate the evil of persons having to climb through automobiles to get to a street car. It always caused trouble because women were getting their clothes dirty and making claims.

With the heartiest kind of co-operation from the Automobile Club, we provided that a mark should be placed at the corners where cars stopped, this mark to be 50 ft. from the intersection, and automobiles would thus know that they would have to park back of the mark. This has worked splendidly, and will be discussed with other phases of parking regulations in a later article.

When the ordinance, as we had agreed upon it, was advertised by the committee of the council which was considering it, and a date set when advocates and opponents of the bill could appear, what happened was that there were only four of us attended the meeting, Mr. Yellott, Mr. Bridges, Mr. Lucius and myself. As we were all for the plan, the hearing lasted five minutes and a short time later the bill was passed and became a law, May 8, 1919. None of us has ever regretted its passage.

How the law worked and what difficulties had to be encountered in stimulating its enforcement will be told in a subsequent article.

Tramway Cars and Trolley Buses in Great Britain

AN AUTHOR writing in the April 22 issue of the *Génie Civil* reviews in extended fashion and with many illustrations the present tramway and trolley bus situation in Great Britain, in so far as the rolling stock is concerned.

The general conclusion, based on an extended study, is that while transportation vehicles in Great Britain cover a wide variety of types, one of their common characteristics is the tendency to use two decks, whether the car is for use on rails or on the roads. This preference is due to appreciation of the ability of the double-deck vehicle to transport large numbers of passengers during the peak with minimum interference with other traffic. On the other hand, one manufacturer who has furnished a number of lines with trolley buses prefers the single-deck bus, but one having a body of large capacity, such as that used by the Tees-side Rail-less Traction Board.

The author of the article quoted sees considerable virtue in the argument for two decks for Paris. He compares a double-deck bus with the last model of bus and trailer put in service before the war by the Compagnie générale des Omnibus, the whole covering a length of 82 ft. One double-deck bus, he states, can easily transport ninety persons.

He also said a good word for the electric trolley bus, for which he sees a future in France in various regions where economical and rapid means of communication are needed, but where the expense of rail lines precludes their use. Sections in the east and north of France, where water power is abundant, will profit particularly by the development of this system.

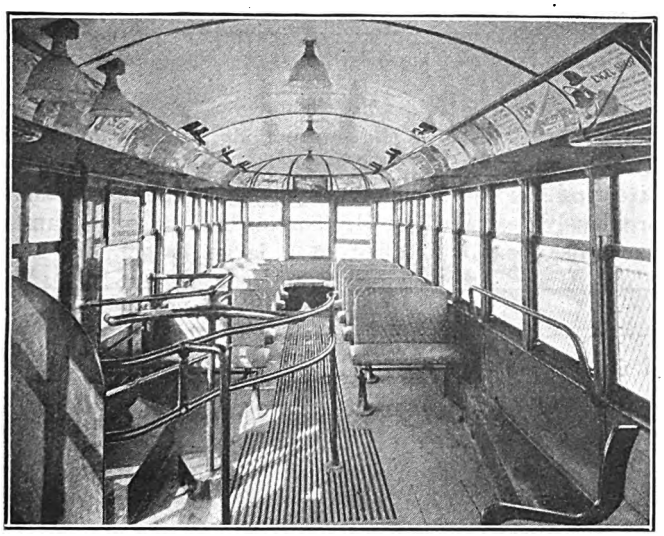
Improvement in Turnstile Cars

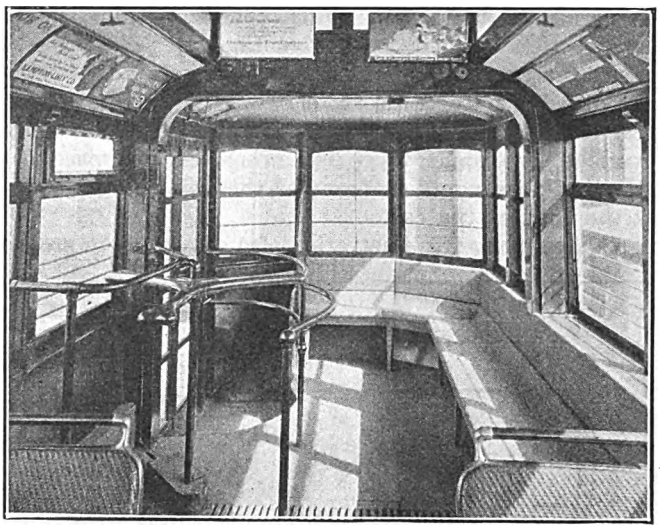
One-Man Operation with Double-Truck Cars in Utica and Syracuse Has Increased Steadily Until Now Utica Has 100 per Cent Operation—Improvements in Turnstile Arrangement Are Described

IN A paper read before the midwinter meeting of the New York Electric Railway Association in New York City on Jan. 24, 1922, H. S. Sweet, engineer of equipment for the New York State Railways, described the novel features of the cars operated by one man in Syracuse and Utica. An abstract of the paper was published in the ELECTRIC RAILWAY JOURNAL for Jan. 28, 1922. For this service double-truck cars are operated on the pay-as-you-leave principle with the rear or center doors used for entrance. Turnstiles are used to prevent exit other than at the front doors.

Since the presentation of this paper a number of improvements have been made in the construction of the turnstiles in the pipe framework for guiding passengers on entering and in the seating arrangement at the entrance. Double-end cars also have been equipped with turnstiles, which is an additional application to that previously described. This latter arrangement permits operation by either one or two men, as desired.



TURNSTILE APPLICATION TO PETER WITT CAR WITH CENTER ENTRANCE



TURNSTILE APPLIED TO REAR ENTRANCE DOOR. NOTE EXTRA SEATS AT SIDE AND REAR

The first design of turnstiles used had four arms and they were constructed of wrought-iron pipe. This pipe-constructed turnstile extended to within approximately 12 in. of the floor and reached to a height of the waist of an average person. In the illustrations used with Mr. Sweet's article there were three projections in a vertical plane for each arm and these were connected together at the ends by a pipe with a tee in the middle and elbows at the ends. The pipe barriers were also constructed with a spacing of approximately 12 in. While this construction provided an effective barrier against passengers trying to force their way underneath, in actual service such a formidable barrier was found unnecessary. In the late design the pipe framing has been simplified to a large extent and consists more of a railing for properly guiding the passengers than a formidable barrier.

The type of turnstile has also been changed from the pipe construction to a three-arm wooden type. Experiments showed that the three-arm type of construction has several important advantages. The natural tendency of passengers when using the turnstile is to turn it for more than a quarter of a turn—in fact, in most cases this is necessary in order to provide for free movement. This, then, leaves the turnstile arm, where a four-arm turnstile is used, in a position which requires further movement before the next passenger can enter, while with the three-arm type of turnstile the passenger on leaving pushes the turnstile to such a position that it can be readily entered by the next passenger. The wooden-top type of turnstile is also of very light construction, which makes it easy to move. It provides a very attractive appearance and with all corners and ends properly rounded there is no obstruction which would in any way have a tendency to cause accidents or tear clothing.

The ratcheting arrangement for the turnstile is located at the bottom of the center support and is inclosed with a sheet-iron case. As described in Mr. Sweet's paper, this has a mechanism for releasing the turnstile so that passengers can use the rear door for exit in case of emergency or at points where fare collectors are stationed to collect the fares at the rear doors to relieve congestion. This releasing of the turnstile for backward movement is entirely controlled by the operator from the front end, and an emergency application of the brake also causes the turnstile to be released as well as to permit the operation of the doors by hand. In the latest arrangement the pipe framework connected to the center support of the turnstile passes above the turnstile arm. This construction was found to be of advantage as the pipe thus forms an effective barrier and prevents the tendency of passengers to push the turnstile to a position further than is absolutely necessary for exit.

In the cars described in Mr. Sweet's paper the turnstiles were located directly opposite the entrance door.

Digitized by Google

Digitized by Google

three-arm turnstile substituted. The latest type of construction provides a space of approximately 28 in. underneath the lowest pipe barrier. This is found of great convenience to passengers who have baggage or bundles as they can pass their baggage underneath the lowest barrier without the necessity of carrying it through the turnstile. The pipe framework is constructed of 1-in. pipe.

An accompanying illustration shows the plan of a double-end car fitted with turnstiles. The general construction and location of the turnstile and barriers are the same as for single-end cars, but of course the seat opposite the entrance and around the rear end of the car is omitted and this space is used for standing passengers or for exit when at the front end. As will be readily seen from a study of the illustration, this type of car can be used for operation by either one or two men.

In the illustration showing the front end of the car an idea can be gained of the free passage used for exit and of the arrangement of the control equipment on the platform.

The Syracuse cars are now being equipped with special safety features which provide all of those found on the standard Birney safety car and several others in addition. The fare box is located just to the right of the hand brake wheel and to the left of the passenger as he leaves the car. A lamp has been installed back of the fare box which illuminates the change tray during darkness, and a shield effectively prevents the rays of this from interfering with the vision of the operator. As a guide to passengers using this type of car a sign is hung on the front reading, "Rear Entrance," and the bulkhead has a large sign inside the car which reads, "Front Way Out. Pay as You Leave." A special form of transfer and change rack has been designed which fits on the window sill back and to the left of the fare box.

Terre Haute Starts Weekly Pass

Elephant "Sandwich-Man" Is Pressed Into Service to Supplement the Company's Newspaper and Car-Window Publicity—Large Sales Are Recorded Despite the Strike of Coal Miners

TERRE HAUTE is so well known for the way it has stimulated traffic through maintenance of the 5-cent fare and the 100 per cent use of short-headway safety cars that one might have expected the management to rest on its laurels by assuming that saturation had been attained in the street car riding habit. One need only mention that in 1913, with but 600 private automobiles, the riding index was 158 rides per inhabitant per annum, yet in 1920, with 5,500 private automobiles in the city, the riding index after falling in the pre-safety years, had risen to 176. The latter condition also obtained during 1921. According to the latest information there are now 11,000 automobiles in Vigo County, of which probably 8,000 are in Terre Haute itself.

THE PAT ARRIVAL OF A CIRCUS WAS TURNED TO GOOD USE BY A QUICK-WITTED MANAGEMENT

For all that, Edwin M. Walker, general manager, was entirely open to consider any plan that would develop revenue and riding still further. He had followed carefully the installation of the weekly unlimited-ride pass at Racine, Kenosha, Youngstown and other places, and concluded that it had merit for Terre Haute conditions. One argument for its use at Terre Haute is that the hard times had brought out some forty to fifty jitneys, part of which fulfill a legitimate job in serving areas not reached directly by the cars, but all of which are free to run as they list. They charge 5 cents, for example, during the daylight hours and 10 cents, nominally, after 7 p.m. However, by a twist of the wrist the 10-cent sign is converted to "Taxi!"

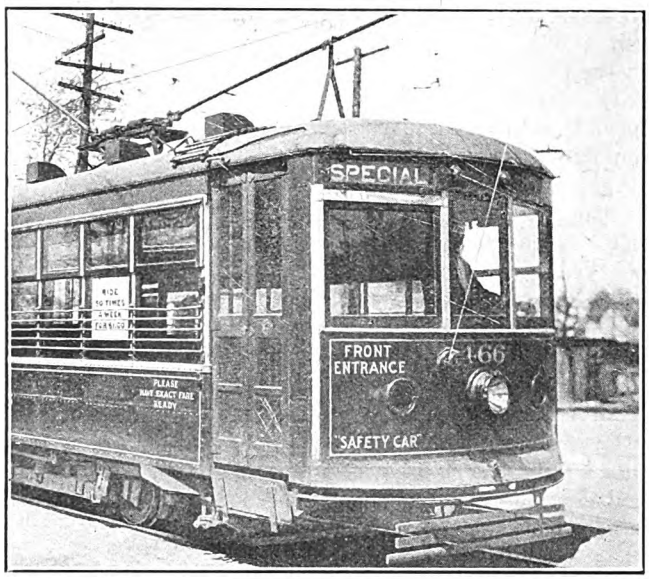
Judging by experience elsewhere, Mr. Walker believed that the jitneys would be brought to a minimum without any regulation whatsoever if the pass were used, since a passholder's privilege of unlimited street railway service cannot be duplicated by individual or even associated jitneymen.

As briefly noted in the ELECTRIC RAILWAY JOURNAL for April 15, 1922, the general publicity was laid out by Walter Jackson working in co-operation with Arthur R. Kling, the company's special publicity man. Extremely favorable news articles appeared in the two local papers, one of which, the *Tribune*, assigned its star reporter to cover the assignment and also ran a complimentary editorial on the management's forehandedness in trying a plan for lower fares and greater public usefulness. The following week the company ran advertising copy daily down to Monday, May 1, the day the passes went into use.

The effectiveness of the "buy in advance" argument may be gaged from the fact that about one-half of the total sales were made on Friday, Saturday and Sunday in advance of use. This is a record achievement, proving incidentally a world of confidence in the promises of the local railway, since the pass was a wholly novel idea to the public. Specimens of the advertising are reproduced. One important feature was the use of a picture showing how the pass should be presented on entering the car. This was held to be wiser than ordering the public to do so and so, aside from which a picture is also more effective.

In addition to the news and advertising matter mentioned, a good news story was made out of the fact

Digitized by Google



EVERY SAFETY CAR EARNED A WINDOW PLACARD, TOO

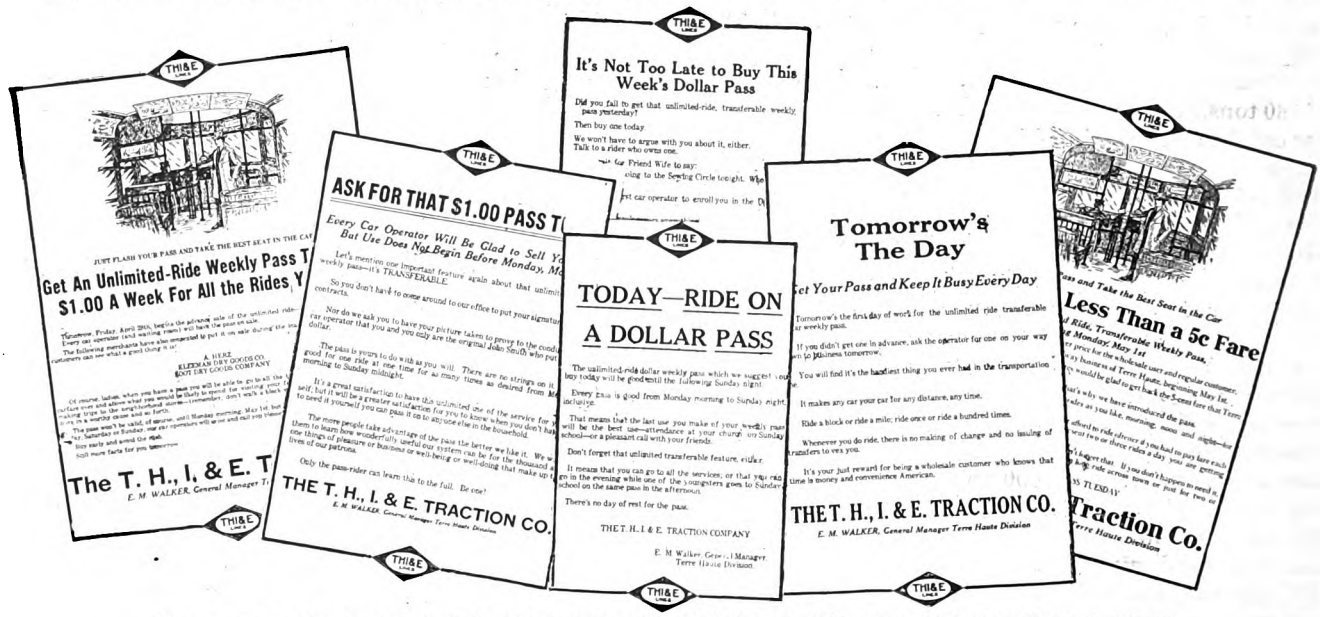
that an admirer had purchased for Mayor Davis Serial No. 1 of Pass No. 1; and there were also the preliminary car window placards setting forth the good news that one could "Ride 50 Times a Week for $1.00." First prize in publicity ideas, nevertheless, must go to Mr. Walker himself, whose quick wit resulted in impressing an elephant of the Gollmar Brothers' circus in town on May 1 to act as a "sandwich-man." As all Terre Haute was lined up to see the circus parade with its Ponderous, Pachydermatous Performers, the good inhabitants were advised to "Be Thrifty—Own a Dollar Weekly Pass—It's Transferable." According to the register records of May 1, the advice was taken to heart, for the pass-holders kept their passes busy enough to average about five "origin-to-destination" rides on Circus Day!

Terre Haute is the center of a coal mining district, harboring some 6,000 miners who have been idle since April 1 and are therefore not prospects for riding on a pass. Their idleness in turn depresses other activities in Terre Haute, which go up or down as the coal business moves. This condition in itself, it is estimated, prevents the sale of at least 1,500 passes a week, assuming that only 25 per cent of the miners took advantage of the pass.

Aside from this temporary obstacle to maximum pass sales is the permanent one that a single trip costs only the low and convenient fare of 5 cents, thus minimizing the argument of convenience and change abolition. The pass also costs $1, which, in this case, means twenty cash fares (there are no ticket rates) compared with the situation in Fort Wayne and Kenosha, where the pass equals sixteen ticket fares; in Racine and New Brighton (Beaver Valley), where it equals seventeen usual fares, and in Youngstown, where it equals but fifteen ticket fares. While this relatively higher price tends to cut down sales, it also comes closer to assuring a profit on the majority of purchasers.

In spite of these handicaps, the sales for the first week were 1,493 out of a total city revenue of $12,651, or 11.8 per cent. This compares with 818 $1 passes in Racine's first week against a then fare of 6 cents and 5½ cents workman's limited-hour fare at a time when Racine was prosperous and had about 60,000 people—or but 6,000 less than Terre Haute. Racine is too close to Chicago and Milwaukee to be as good a shopping town as Terre Haute, but on the other hand it has a greater diversity of high-grade industries. Present Racine sales are on the order of 2,200 a week, showing that the public takes to this style of transportation more and more as times goes on.

The Terre Haute, Indianapolis & Eastern Traction Company is registering the presentation of passes on an overhead register, while cash fares are dropped in a counting-type farebox. The figures for the first week show a total of 59,279 registrations, the equivalent of forty rides per pass a week. After making 25 per cent allowance for what would otherwise be transfers, the net "origin-to-destination" rides per week proved to be 30. This figure was doubtless swollen by the advent of the circus, May 1. From general experience with passes in cities of similar size and area, it may be estimated that with a greater number of sales the average daily rides should be four, except for Sundays and holidays, when the average falls to two and one-half.



SPECIMENS OF NEWSPAPER ADVERTISING WHICH SUPPLEMENTED AND FOLLOWED LIBERAL NEWS ARTICLES

While it is too soon to expect any heavy decline in the forty to fifty competitive jitneys, a number of partial

Digitized by Google

THE BACK OF THIS PASS FEATURES THE COMPANY'S GOODS—THE SAFETY CAR

or complete jitney customers have stated that the weekly pass means an end of jitney riding for them. Perhaps the most interesting incident in this connection was the boldness of one of the platform men who deliberately planted himself at Seventh Street and Wabash Avenue, and sold twenty-six passes right under the noses of the discomforted jitney operators!

Mr. Walker's enthusiasm for the safety car is reflected in the style of pass adopted. The back carries a half-tone engraving of a flock of the famous "green bugs" of Terre Haute. To encourage the sense of salesmanship in his men, he has arranged to put them on a commission basis at the rate of 2 cents per pass sold. The range of sales ability among platform men is revealed by the difference in sales, the top man selling 60 and the bottom man 5 passes. During the first week there were also three prizes of $3, $2 and $1.

New Locomotives for Metropolitan (London) Railway

TWENTY electric locomotives of new design are being supplied to the Metropolitan Railway for service between Aldgate and Baker streets, London, on the Metropolitan Railway. These are replacing steam locomotives. They haul a trailing load of 180 tons, six of the standard passenger coaches, and are designed for high-speed service. The energy consumption guaranteed by the contractors, the Metropolitan-Vickers Company, Ltd., was 60 watt-hours per ton-mile.

The locomotives are of the 0-4-4-0 type, comprising two trucks, each carrying two 300-hp. self-ventilated motors driving the axles through single reduction gearing. The total weight is approximately 57½ tons.

The electric power supply for these locomotives is at 500 to 600 volts on a third rail, with an insulated negative return rail laid in the center of the track. The running rails are not used for the return circuit as they are employed in connection with a signaling system. There are four positive and two negative collecting shoes on the locomotive, the positive shoes being in duplicate, one set of shoes being fixed on each side. The negative shoes are on the center line. Collecting shoes are also carried by some of the coaches and are connected to a power bus line running through the train. This is to permit the train to pass readily over gaps in the collecting rail.

DATA FOR NEW METROPOLITAN RAILWAY 1,200-HP. ELECTRIC LOCOMOTIVE

Length over buffers	39 ft. 6 in.
Length over body	35 ft.
Width over body	8 ft.
Height from rails	12 ft. 4½ in.
Center to center of trucks	20 ft. 3 in.
Wheelbase of motor truck	9 ft. 3 in.
Total wheelbase	29 ft. 6 in.
Diameter of running wheels	43½ in.
Gear ratio	23 to 57

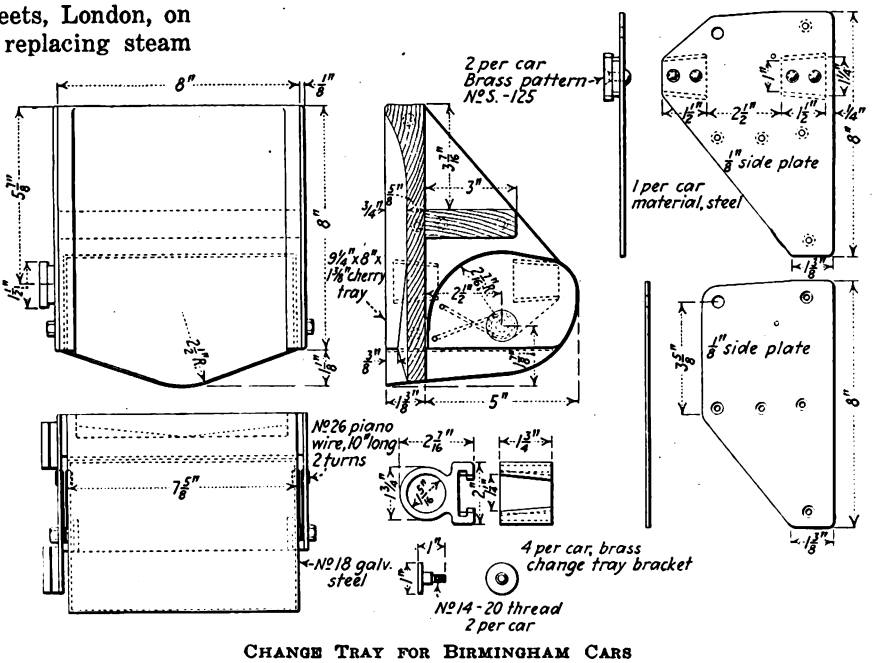
Some of the dimensions of the locomotive are given in the accompanying table.

These locomotives are being supplied to the specifications of Charles Jones, mechanical and electrical engineer of the railway. The details of the locomotive are covered in recent articles in *Engineering*, London.

Change Tray in Birmingham

A SIMPLE change tray has been installed on a number of the one-man cars of the Birmingham Railway Light & Power Company of Birmingham, Ala. This company charges an 8-cent cash fare, sells tickets at a reduced rate, and issues transfers, and the tray has been found a great convenience to both operator and passengers. As shown in accompanying illustration the tray is mounted on the usual bracket that supports the fare box and consists of a dished-tray made out of 1¼-in. cherry board and about 7 in. x 8 in. in size. This tray is supported on either side by thin steel plates, which project about ½ in. above the cherry board. The tray is swiveled on the post so that it can be revolved as desired by the operator. It is also arranged so that the operator can tip it toward himself, when the tickets and cash which may be on the tray will run into his hand.

The tray allows passengers when boarding the car to deposit their fares and transfers on the tray and take their seats. It also provides a very satisfactory means for the operator to make change. By it also the fare is deposited in plain view of the operator, who thus has an opportunity to know that the correct fare has been paid. An overhead double fare register is used.



CHANGE TRAY FOR BIRMINGHAM CARS

Electric Railway Publicity

Devoted to How to Tell the Story

Hospitality Month at Elmira

THE success of the Courtesy Campaign conducted by the Fifth Avenue Coach Company, New York City, and of the Civility Campaign of the Northern Ohio Traction & Light Company, Akron, Ohio, led F. H. Hill, vice-president and general manager of the Elmira Water, Light & Railroad Company, Elmira, N. Y., to consider holding a similar campaign on his property.

Mr. Hill's company subscribes to Babson's reports, and while the proposed Courtesy Campaign was being considered Roger W. Babson's letter on hospitality was received. This letter gave Mr. Hill the inspiration to go further than a Courtesy or Civility Campaign and to have a Hospitality Month.

Accordingly the period from Feb. 15 to March 15 was designated as Hospitality Month and plans were made for an intensive campaign among the employees of the company.

The first step was a letter from Mr. Hill announcing the campaign and the reasons for it. This letter, mailed to each employee's home, read as follows:

Feb. 3, 1922.

Dear Fellow Worker:

All of us depend upon the public, whom we supply with electric, gas or street car service, for our living.

Most of us come in contact with the public to some extent either face to face or over the telephone. The public judges any concern largely by the action of its employees, and the public must think well of it before any concern can be prosperous.

On our cars, for instance, if we are cheerful and courteous and help render good, safe service, the public will feel at home and will be pleased. A pleased public means that more street car rides, or electricity or gas, will be sold; this makes for the prosperity of the company, in which we all share.

This spirit of hospitality is indispensable to the prosperity not merely of our company or our city but of the entire nation.

We wish to do our part in promoting hospitality by holding a "Hospitality Month" beginning Feb. 15, believing that all of us will become so accustomed to cheerful and courteous thoughts and words and acts during this month that hospitality will become a habit.

During the month we will have a number of employees' meetings at Roricks Glen, at which there will be talks by interesting speakers, followed by entertainment. Watch the bulletin boards for further announcements.

Let us all co-operate so that we may have a real "Hospitality Month."

Sincerely yours,
F. H. HILL, Vice-president.

Then a series of four meetings for employees and their families was planned, to be held in the company's dancing pavilion in the park operated in connection with the street railway system.

Just before the first of these meetings a special announcement of the meeting was mailed to each employee, together with a booklet containing extracts from Mr. Babson's letter on hospitality.

The first meeting was held on Feb. 15, with Mr. Hill presiding. The speaker of the evening was John MacIntyre of the Society for Electrical Development. Another meeting was held Feb. 28, with H. B. Harmer,

One Thought a Day About Our Business

Number 8 *Feb. 22, 1922*

Passing the Buck

A favorite sport these days is that known as "Passing the Buck." With some of us the game becomes a habit and we attempt to dodge duties and responsibilities by passing them on to someone else.

In a large organization like ours each one of us, of necessity, has certain defined duties and responsibilities, which if properly attended to are enough to keep us busy. However, if we do not take an active interest in the company and its customers, we are simply job holders and neither the company nor ourselves will make the best progress.

Every day our customers or others outside the company ask for information concerning the company and its service which you are not always in position to give. Do not give an evasive or inaccurate reply or say something to the effect "you will have to ask the office." Instead tell the questioner that you will see to it that he secures the information he desires. If it is necessary for the inquirer to discuss the matter with some one at the office give specific information as to whom he should see and where.

Nothing is more exasperating than to be passed from one person or department to another in an effort to secure information. Remember that few people have any conception of the size and scope of our organization and true hospitality demands that we show an active personal interest in seeing that no one has just cause to complain of our methods and service.

H. E. GOUGH,
Assistant to General Manager.

NOTE—A new thought prepared by an employee is distributed each day during Hospitality Month to all employees
Please save this and put it in the folder provided.
ELMIRA WATER, LIGHT & R. R. CO., Elmira, N. Y.

Service

Service is a rather broad term. To comprehend its fullest significance when applied to the Public Utilities Organization would afford some student of thought a study worth while. We, as members of such a body, may consider "service" from a twofold point of view. First: Our Service to the Company; Second: Our Service to the Public.

Considering the first: Regardless of our relative position in the cog-wheel of business, we all play an important part in the performance of our respective duties. To attain a maximum degree of efficiency means that every one must conscientiously render service which is as near 100 per cent perfect as human beings can make it. While the business may be divided into functional units such as power house, traction, gas, electric light and office departments, these various components are so dependent upon one another that co-operation to the fullest extent makes for the high grade of service, which it is our duty to render.

Considering the second: Who may judge the character and quality of our service better than our customers? Truly, they make it possible for us to do business. We owe our very existence to them. All of us know just what constitutes service from the viewpoint of our customers.

It seems that such vital characteristics as loyalty, co-operation, hospitality, sincerity and courtesy should be manifested in every word and deed not only in our organization but also in our relationship to our customers. Service which is cheerful and ever increasing in its quality insures mutual satisfaction of a lasting nature to each and every one concerned.

LESLIE E. MILLS,
Service Department.

Hospitality

The dictionary gives the meaning of hospitality as "an act of receiving or entertaining guests." If we take this meaning as it stands and practice it, we will only be showing hospitality to those who come IN to see us, and not to those we go OUT to see. We must remember that kindness can be shown to everyone, no matter who. It doesn't have to be shown by an entertainment, just one pleasant word will do the work.

There are a number of persons, it is true, who will not accept a little word of hospitality, and who will give no word of kindness in return. It is up to us to show these people how to take it, and how to pass it on.

We cannot expect hospitality if we ourselves fail to show it to others.

MAE MOLTER,
Stenographer, Car Barns.

EXAMPLES OF "DAILY THOUGHTS" SUBMITTED BY THE ELMIRA COMPANY'S EMPLOYEES

Digitized by Google

safety engineer of the Philadelphia Electric Company, as the speaker. On March 9 the third meeting was held, W. H. Boyce, general manager of the Beaver Valley Traction Company, New Brighton, Pa., being the speaker. At each of these meetings Mr. Hill also gave a short talk on the reasons for the hospitality movement, and in addition to the talks there were entertainment of various kinds and refreshments.

For the fourth meeting no speaker was "imported," but A. C. Jordan, general electrical superintendent of the company, and Mr. Hill gave short talks on the experiences and results of Hospitality Month. A safety moving picture was shown in connection with a trial of two moving picture machines.

No special efforts were made to reach the public direct during the campaign, except that announcement of Hospitality Month and the employees' meetings was made in the newspapers and car cards were inserted in the street cars.

For each day during Hospitality Month there was printed and distributed a series of short articles called "One Thought a Day About Our Business." The first of these "thoughts" was written by Mr. Hill and each succeeding one was written by a different employee on a subject of interest to all employees. These "thoughts" created much interest among the employees and they looked forward each day to receiving the "Daily Thought."

During Hospitality Month a card was given to each of the company's customers by the meter readers, asking for suggestions or criticisms regarding the service. Many of these cards came back with suggestions or complaints and quite a few stated that the service was very satisfactory.

The main result of Hospitality Month among the employees was a greatly increased effort on the part of all departments to give good service to the customers of the company. The company meetings also resulted in getting the employees of the various departments better acquainted with each other. The Elmira Water, Light & Railroad Company is a combination utility, supplying electric, gas and street railway service. Before Hospitality Month the employees of one department had very little in common with those of another, but a splendid spirit of co-operation has been developed.

While one month was set aside as Hospitality Month and an intensive effort made to interest employees in hospitality, the idea will be kept constantly before the employees.

Likes Complaints—At Headquarters

THE only advantage in a complaining public, so feels the Portland Railway, Light & Power Company, Portland, Ore., lies in the public complaining directly to headquarters. The company is therefore appealing not only to those who have complaints but also to those who have suggestions to offer or constructive criticism to give by inclosing stuffers in all letters.

The inclosure creates good will by showing the public that the company sincerely wishes persons to call the office at any time. The company "is always striving to give adequate and dependable service," the slip states. The telephone number of the superintendent of city line transportation is included on the advertisement, so that all complaints may be made directly to the office.

Artistic Posters and a Fairy Tale Advertise London Underground

A LONDON public, jaded by much advertising, is being directed in an artistic manner to ride on the lines of the Underground Electric Railways and the London General Omnibus Company. The traffic advertising agent of these two companies, in addition to unusually well-designed posters, has issued a book daintily illustrated with pen and ink drawings. The story is of the fairies of the world underneath London, who have had to move on and on in front of the oncoming underground railways. Of course, the verses state that buses of the London General Omnibus Company are routed to the edge of the wood into which the fairies have retired at the present time. The posters used during the past few months are a departure from the customary type used for advertising services of railway and bus companies. The accompanying illustrations show how these London companies convince a prospective passenger to take a ride.

THE ART DISPLAYED IN THESE LONDON UNDERGROUND POSTERS IS ONE OF THE CHIEF SALES APPEALS

C. E. R. A. Engineers Meet in Louisville and Cleveland

Determination Expressed at Eastern Section Conference to Standardize Wheel Specifications—Safety Car Maintenance Figures and Report on Wheel Welding and Power Saving Devices Presented—Other Common Problems Discussed

DURING the last week of April two of the sectional divisions of the Engineering Council, Central Electric Railway Association, had their meetings, the southern section convening in Louisville, Ky., on April 26 and the eastern section on the following day in Cleveland. Each meeting was well attended by the track and equipment men of that section and several of the same questions were actively discussed by both divisions. Following the session in Louisville, those present were conducted by F. H. Miller, vice-president Louisville Railway, on an inspection tour of the company's shops and power plant. Likewise the Cleveland group spent part of their afternoon in the Harvard shops of the Cleveland Railway.

One of the most pertinent topics that received full discussion at the Louisville meeting was the advisability of using flexible in preference to rigid conduit for car wiring. It was the consensus of opinion that circular loom when joined with non-metallic junction boxes is safer than metal conduit. Metal conduit does not confine the fire when a short-circuit occurs because it is completely burned through. Several delegates told of having one-man cars on which circular loom had been used entirely, and one member reported that he was using flexible conduit on all light-weight cars. Because of the insurance requirements, which place a higher rate on cars equipped with flexible conduit, it was thought that the problem was worthy of further study in order to convince the insurance people that no extra hazards were incurred. All agreed that it was a question of economy, for if conduit of the flexible type serves the purpose as well as that of the rigid type, there is no reason why the cheaper material should not be used. In order to collect actual operating data on the safety, cost and life of flexible conduit, the question was referred to a special committee.

Experience Exchanged on Lightning Protection

Experiences were exchanged on the question of the efficiency of various types of lightning arresters. All agreed that the effectiveness of the electrolytic type of arrester is very high, although some believed that the protection given by this type does not justify its cost of inspection and maintenance. To see whether or not the electrolytic arrester is operative, it must be inspected after every storm, a task that entails considerable expense and inconvenience when the arresters are not located in an accessible location. There is also the disadvantage that protection is not complete during a storm, for the fuse may have been blown during the early part of the storm. This leaves the equipment unprotected without knowledge of that fact, as the blown fuse is not detected until inspection after the storm. It was related that on one property where the cars were protected by electrolytic arresters an armature had never been lost from lightning. For this reason it was believed that the maintenance and inspection costs were warranted by the results. As to the location of arresters, several companies are now moving them from the roof to the underside of the car to make inspection easier and to eliminate damage from limbs of trees.

As to protection of the system in general from lightning, Adolph Schlesinger said that the Indianapolis, Terre Haute & Eastern Traction Company has had excellent results from the practice of placing protective devices in the power houses, substations and on cars, only. The company has so many miles of interurban road that it was found impossible after each storm adequately to maintain the arresters located on the poles. Consequently they have been removed. He did not, however, recommend this practice for city service, where the inspection problem is much simpler.

Relation of Ballast to Signals

Because of the trouble experienced with automatic block signals when cinder ballast has been used, L. A. Mitchell, Union Traction Company of Indiana, told the practice of this company in this respect. He said that all cinders from the company's power plant are used for track ballast and he believes it is an excellent material for tracks having wheel loads within the range of those for which electric railway equipment is designed. However, it has been found that when the cinders come in contact with the base of the rail, the working of the signals is seriously affected. The theory, of course, is that no ballast of any kind should be in contact with the rail. Current leakage through cinder ballast in dry weather is not much different from that through gravel or stone ballast. The effect of such leakage is most noticeable during rainy weather when the conductivity of the cinders is increased due to the porous structure. This means that close care must be exercised in trimming ballast to avoid contact with the rail.

It was brought out also that there are other reasons why the ballast should be kept away from the rail. Cinder ballast has a tendency to corrode the rail, and the creeping in of the powdered cinders between the rail and the tie causes the tie fiber to be mechanically destroyed due to the abrasive action.

Although on one road it was stated that no less trouble with block signals was experienced when special care had been taken to trim the ballast, all agreed that the question called for co-operation between the track and signal maintainers because there is a limit to which the voltage can be raised. Mr. Mitchell added that keeping up insulated joints had aided materially in eliminating signal troubles on the property with which he was connected.

Nearly all the equipment men present were using or had given a trial to the Frary bearing metal. Nearly all had found that journal bearings of this metal gave an unusually large mileage, but their experience with it for axles and motor bearings had not been as successful. In several cases it was reported that the metal had broken and crumbled when used in that service. Consequently it was agreed that a tin base metal gave better service for motor and axle bearings while the Frary metal was good for journal bearings.

In connection with the trouble from excessive side wear of brushes and brush-holders, it was pointed out that the manufacturers are bringing out brush-holders with renewable carbon ways to make necessary the replacement of only the wearing surfaces. The equipment men claimed that the brush-holders were the least of their worries in this problem.

Report of Eastern Section Meeting

The principal constructive work of the eastern section consisted of the committee reports on welding flanges, power-saving devices, wheel standardization and standardization of trolley pole lengths. The report of the committee on welding flanges on rolled steel wheels, of which R. Moses is chairman, based its report on information secured from fifteen railways, one wheel manufacturer and one manufacturer of welding apparatus. Of the fifteen railways, eight had been doing flange welding for a period of from one to three years and seven had never attempted welding of wheel flanges. These seven properties stated that they do not consider it a safe and economical practice. They make this assertion, however, it was said, without having made any investigations or tests. The eight properties which have engaged in flange welding stated that they have not had a case of a welded flange breaking.

The wheel manufacturer furnished the following information to the committee:

Digitized by Google

In order to weld the metal to the flange of the wheel both the added metal and the portion of the flange with which it comes in contact must be heated to a temperature of fusion. As soon as the source of heat is removed, this highly heated metal is rapidly cooled by the conduction of the heat to the cooler portions of the wheel. This heat abstraction is so rapid that it practically amounts to a quench. We would therefore expect the metal in this wheel, particularly in the neighborhood of the flange, to be in a highly strained condition as a result of this treatment. Moreover, the fused metal will have a poor structure due to the fact that no work has been done on it since it was in the molten condition.

In addition to this, the making of a weld mechanically perfect by the arc process is a difficult job and requires expert labor. Inexperienced operators would probably leave portions where the weld is not even mechanically perfect.

We believe that for city cars where the service is not excessive and where the girder type of rail is used that the damage from broken flanges may not cause serious trouble. However, for interurban service where the cars run at high speed and where the T-rail is used, the danger from derailment with a broken flange is greatly increased. There is no doubt in our minds that the welded flange would not be suitable for interurban service.

The manufacturer of welding apparatus made this statement to the committee:

After making exhaustive tests we find the thermal disturbance immediately below the line of welding extends to approximately ⅛ in. This zone has all the attributes of a heat-treated steel resulting in a much tougher metal than is found in the usual rolled steel wheel. Under these conditions we cannot help but feel that it is perfectly safe to build up flanges on steel wheels and the fact that several railways have been doing this with entire success from a period of one to three years would tend to bear us out in this assertion.

The committee found that the welding process employing a dynamo or motor-generator outfit with an automatic feed is by far superior to other types for flange welding. Its speed, uniformity of arc and economy account for its superiority.

The average cost of welding a flange on a 26-in. wheel with a dynamo or motor-generator outfit equipped with an automatic feed, as found by the committee, is $2.95. The average cost by hand welding with the same type of outfit, as reported from six properties, is $4.27.

The committee recommended to the section the practice of welding flanges on rolled steel wheels as a safe and economical one for city cars when the work is performed in the proper manner. As to the safety of this practice, the committee failed to find any instance where a flange had broken after it had been electrically welded. The committee contended that welding wheels is an economical practice when a flange can be welded to the proper contour at a cost not exceeding $4. Approximately 40,000 miles additional wear is obtained by saving a wheel from being turned.

The committee also emphasized the fact that wonderful strides in wheel welding practice have been made and that the council members assist in perfecting the practice. It was its belief also that when the art of flange welding is perfected, the electric railway industry will have secured something that will mean a big saving in operating expenses.

Active Work on Wheel Standardization

A. B. Creelman, master mechanic Youngstown (Ohio) Municipal Railway, presented a progress report for the committee on wheel standardization. He had received nineteen answers to thirty-three questionnaires sent out to the member companies of the section. The answers showed that there were seven different specifications for 37-in. wheels, nine for 36-in., fourteen for 34-in., fourteen for 33-in., one for 30-in., and one for 28-in. Mr. Creelman stated that altogether the electric railways of the country are using 1,100 types of wheels having different contours and hub projections. After sufficient data are accumlated and a thorough study has been made, the section expressed its eagerness to bring about an early reduction in the number of sizes and types. For this purpose the manufacturers also are ready to co-operate by giving the benefit of their research and experience. Should this standardization be brought about, Mr. Creelman stated, it would mean an approximate reduction in the cost of wheels of $5 apiece. He added that the steam roads had gone through this same situation and successfully solved the problem by reducing 2,600 different types of wheels to the ten standards now in use. The subject is to be continued and reported on at the November meeting of the section.

G. H. Kelsay, superintendent of power and equipment, Cleveland, Southwestern & Columbus Railway, presented the report of the committee on power-saving devices, which consisted of a symposium of the results obtained on a large number of electric railways in the United States. The records of some of these installations show interesting economies.

Supplementing this report, P. J. Wood, Buffalo & Lake Erie Traction Company, said that his company had effected a 10 per cent average saving in power, measured at the switchboard, by the use of kilowatt-hour meters and that the brake-shoe cost per 1,000 car-miles had been reduced from $1.63 to $1.17. Based on seven months of operation, the cost of the meters and their installation, together with all other expense connected with their use, will be paid for in a year by the decreased energy consumption. The installation of car inspection dial meters has also made possible an improvement in inspection and maintenance work through placing these on a kilowatt-hour instead of a mileage basis.

H. W. Witherspoon said that on the Stark Electric Railway car maintenance had been reduced 18 to 20 per cent since the property began checking operation by the use of energy meters on the cars, and that in more than two years of their use, the energy consumption had been reduced from 6.6 to 4.69 kw.-hr. per car-mile. He also stated that the introduction of car meters had been an important factor leading to radical changes in the company's generating, transmission and distribution system, the revamping of which had netted substantial savings. Mr. Witherspoon also gave figures showing the reduction in car failure, brakeshoe wear, controller maintenance, etc.

Company	Saving
Philadelphia Rapid Transit	20 cents net per car-day after deducting operating and overhead charges in energy and using fuel cost only. 5 cents per car-day in carhouse labor using fuel cost only.
Cincinnati Traction Company	$7.90 per car per month in energy.
Illinois Traction System	Approximately 0.25 kw.-hr. per car-mile on safety cars over a year's period.
Seattle Municipal Railway	0.5 kw.-hr. per car-mile at d.c. board.
Union Traction Company of Indiana	0.5 kw.-hr. per car-mile at d.c. board.
San Diego (Cal.) Electric Railway	$110 per car per year resulting from a 15.41 per cent reduction in energy.
Washington-Virginia Railway	13.2 per cent in energy. 14.7 per cent maximum demand. 104 per cent on investment in three months.
South Covington & Cincinnati Street Ry.	Total energy consumption held practically at a level for five years even though twenty-five double-truck replaced twenty-five single-truck cars and passengers per car-mile had increased 30 per cent.

Trolley Pole Lengths

Terence Scullin, master mechanic Cleveland Railway, presented the committee report on the standardization of trolley pole length. The committee recommended a 13.5-ft. trolley pole as standard, claiming that according to its investigations this length ought to meet any requirement. A pole of this length mounted on a car about 12 ft. high rises to an angle of about 45 deg. when making contact with a trolley wire at a railroad crossing, the minimum height for which is 22 ft. For the standard height of trolley wire of 18 ft. the normal pole angle is 25 deg. The report was accepted by the section.

As was agreed at the November meeting of the eastern section, cost figures on the maintenance of safety cars were kept by several of the railways. The two sets of data presented were as follows:

MAINTENANCE COST PER CAR-MILE—SAFETY CARS

Account and Item	Youngstown Municipal Ry. Cents	N. O. T. & L. Cents
30 and 33 Body and truck repairs	0.3	0.509
70 Inspection and cleaning	0.1	0.466
80 Damages	0.0006	0.001
	0.4006	0.976

The figures obtained on the Youngstown Municipal Railway are based on

Digitized by Google

the operation of twenty-four cars, twelve of which are eighteen months old and twelve four months old. The cars are inspected every five days and cleaned every two days. The results for the Northern Ohio Traction & Light Company were obtained from 55,800 car-miles operated by the safety cars in Massillon. Both sets of figures are for one month of operation. Mr. Creelman explained that the accidents with safety cars has decreased appreciably during the second year of their operation largely because all the men had then become accustomed to their use. In answer to the contention that safety-car collision accidents are still very high, he said that the cost and time required for repairing safety cars are much less than those for the heavier type of equipment. As to the cost of painting safety cars, Mr. See said that a car could be varnished outside and cleaned inside for $25. Several others gave approximately the same cost.

As in the southern section, the advisability of using flexible conduit was discussed in the eastern group. The majority had obtained favorable service from flexible conduit, while one member reported that he had noted excessive deterioration in material of this kind installed on cars in service since December, 1918. Its inadequate protection to the wires had also caused several fires. On the other hand it was reported that installations of "duraduct" and "flexiduct" had been in service successfully from four to nine years.

W. R. Goodnight, master mechanic Cleveland, Southwestern & Columbus Railway, was the only member who had made any concrete observations as to the proper length of trolley ear for any size of wire. After experimenting for two years with trolley ears varying in length from 8 to 15 in. he had decided on the 15-in. ear for No. 000 grooved wire.

A question that has become pertinent in some cities is that of supporting trolley span wires from buildings along the thoroughfare, thus eliminating the necessity for poles. In Columbus, Ohio, it was stated, the building owners insist that the span wires be attached to their structures rather than to poles. In some cities, Terre Haute in particular, city ordinances have ordered the removal of poles for esthetic and lighting considerations. As far as was known, no electrolytic action on steel building structures had been experienced due to faulty insulation. It is more difficult, in spanning between buildings, to construct an overhead of neat appearance because of the varying span length and height of attachments.

C. E. R. A. Cruise Selling Fast

THE committee on arrangements for the summer meeting and cruise of the Central Electric Railway Association reports that the sales of tickets thus far this year are 50 per cent ahead of the sales at the same time last year. John Benham, secretary of the committee, suggests that this should be borne in mind by those who desire choice accommodations, for assignments of space are made in the order in which applications are received.

The cruise is to start from Chicago on Sunday, June 25, and end at that city on Friday, June 30. Stops en route will be made at Detroit, Toledo and Cleveland for the purpose of picking up additional passengers, though the great majority of delegates will make the entire round trip. The business meetings of the association will be held on Tuesday afternoon, June 27, while the boat plies between Toledo and Cleveland; on Wednesday afternoon after the boat passes Port Huron and is out in Lake Huron; and on Thursday afternoon, after the boat leaves Traverse City and heads out into Lake Michigan from Grand Traverse Bay. The program of the business sessions has not yet been announced.

Traffic Congestion*

The Causes for Traffic Congestion Are Analyzed and Suggestions of Means for Its Reduction Are Made

BY WILLIAM W. HOLDEN
Superintendent of Transportation,
San Antonio Public Service Company

ALL street railway men know that irregularity in schedule causes more dissatisfaction with service than any other factor in the business. Schedules are planned to take care of transportation requirements, but when the plans miscarry, the service is inadequate. Between 50 and 95 per cent and probably nearer 95 per cent of the irregularities in schedule are caused by traffic congestion in the downtown districts. Accidents, of course, are invariably a result of traffic congestion. For the first three months of this year slightly more than 30 per cent of all accidents of the San Antonio Public Service Company were within a circle of ¼ mile radius comprising the downtown loop. While it is hard to express the cost of traffic congestion in dollars and cents, it is apparently also hard to exaggerate the value of measures to reduce traffic congestion.

No general remedy can be recommended or applied as a cure-all for traffic troubles. The stop watch and counter must be called into play and each separate item of time expenditure measured. The time of stopping, the time of unloading, the time of loading, the time for throwing switches, the time for waiting on other traffic and the time of accelerating must all be measured. The point or points of greatest congestion are the places to analyze. A chain is only as strong as its weakest link and traffic movement is only as fast as the slowest point.

The time of acceleration and the time of braking are both fixed at a minimum by the friction between rail and wheels. On dry rail the rate averages about 2 m.p.h.p.s. This may be exceeded, of course, and cannot always be obtained in traffic but it may be accepted as an average. If cars are equipped to get the maximum braking possible and motored to get the maximum acceleration possible, we can say that each stop will average to take approximately sixteen seconds for braking and acceleration.

Where passengers leave the car by a separate door from the entrance, unloading seldom has any effect on the limitations of traffic congestion, as it is usually in the afternoon peak that the greatest difficulty is encountered in getting cars through congestion, and at that time the traffic is loading in the congested district. However, where one entrance is used for both entrance and exit, unloading adds to the delay. Stop-switch checks have shown that the time per passenger for unloading will average about 1.85 seconds in a single stream. With larger numbers of passengers unloading than experienced in the check made, this might be reduced to 1.75 seconds per passenger. If only a few passengers unload, this item will not be of sufficient importance to pay for a change of design of cars already in service, but the use of double doors should be considered when new equipment is ordered.

We can assume that the minimum length of time to load where no fares are collected at entrance would be the same as that for unloading. With this assumption, any additional time for loading would be chargeable to fare collection and would represent what could be saved in part or whole by a method of fare collection where passengers pay as they enter inbound and pay as they leave outbound, or by the use of men making change on the ground. Fare collectors using an additional entrance could save a maximum of one-half the time required for loading after allowing for unloading at the extra entrance. To illustrate these points, our stop-watch observations show a case of fifteen passengers boarding a double-opening car and five passengers leaving. The passengers boarding consume an average of 2.25 seconds. Of this, 1.75 seconds, or 0.5 second per passenger, or 7.5 seconds per stop, is the maximum that could be saved by change makers or the pay-enter inbound and pay-leave outbound method of collection. If front-entrance collectors were used, the maximum saving per stop would be ½ [(2.25 x 15)-(1.75 x 5)]=12.5 seconds.

Where a single-opening car is used, only the saving that could be made by the change makers or the pay-enter

*Abstract of paper presented before the Street & Interurban Railway Section of the Southwestern Electrical & Gas Association, San Antonio, Tex., May 3-5, 1922.

Digitized by Google

inbound and pay-leave outbound system would be available.

Odd-cent fares tend to increase the amount of time consumed in loading passengers on the pay-enter plan. This can be offset to some extent by the use of metal fares. In the observations reported, the fare collected is 8 cents, of which approximately 45 per cent of the paid fares were metal tokens.

The time for throwing switches will vary somewhat, due to the amount of traffic at an intersection. Stop-watch checks have shown that it will average about twenty-five seconds. Not only must each car that takes a branch-off throw the switch, but each car following on the through route must also throw it. This time can be reduced by switching through a hole in the platform floor and can be almost entirely eliminated by the use of electrically operated switches except for some slowing down of the car, mistakes in throwing and occasional failure to throw. Electrical switches have been installed in San Antonio in twenty out of twenty-three possible locations in the downtown section. They are especially effective in helping the one-man cars, as the operator does not have to leave his position and possibly neglect his fare collections. With two-man cars the motorman can frequently throw the switch while the conductor is engaged with the loading of passengers, so that no additional time or only part is consumed on these occasions.

Delays From Other Vehicles

The time of waiting on other traffic includes the time of waiting on other street cars and other vehicles. There will always be some mutual interference, and the amount of this will be determined by the width of the street combined with the number of vehicles passing and modified by the amount and quality of traffic regulations.

An average double-track line will require 18 ft. of roadway for street cars, and the average passenger automobile is 6 ft. wide. Hence, with a parking allowance of 1 ft. from the curb, a street should be 32 ft. wide to permit parking or to allow a double line of traffic without parking. It should be 46 ft. wide to allow parking and a double line of traffic, or no parking and a triple line of traffic, etc.

There are three items of traffic regulation that affect the movement of traffic in the congested centers, namely, parking regulations, movement of vehicles past standing street cars, and regulation of left-hand turns. Parking by the side of loading places cuts down the use of the street for traffic so that for streets of less than 50-ft. width between curbs, the street is no better than an 18-ft. street. Parking between stops cuts down the available free running space for vehicles, but even where parking is permitted between stops the delays occur chiefly at intersections. The delay between stops is occasioned by vehicles pulling into or pulling out of their parking berths. This frequently blocks traffic as far back as the intersection and for periods as long as a minute or even more. Parking time is usually limited to ten, twenty, or thirty minutes on such streets. Instead of helping traffic, this really retards traffic because it is due to the pulling in or out of the parking berths that the greatest delay occurs. From a traffic standpoint, if parking is to be permitted at all, it would be better not to fix a time limit. Parking between stops is also very expensive in accidents. By far the most frequent of all accidents with vehicles are caused by parked vehicles being pulled by their drivers out from the curb without looking behind them or without signaling to traffic to their rear at all, or at least in time to be of any value.

A great many cities have regulations that vehicles must not pass street cars while stopped for passenger interchange. This is required for safety and is an essential precaution. However, it increases the delays in traffic movement, and these delays can be greatly cut down by the use of safety zones or loading platforms and permitting vehicles to pass where such precautions are taken. Safety zones should be at least 3 ft. wide and loading platforms should be a little wider. Safety zones are more satisfactory in comparatively narrow streets, say from 38 ft. to 50 ft., because they are easily movable to accommodate special traffic conditions and add less to the congestion and liability to accidents with vehicles. Where streets are wider than, say, 50 ft., the platform furnishes a safer place for passengers, and the platform does not offer so great an obstacle to traffic.

Left-hand turns in congested centers are always a cause of additional delay. Stop-watch checks will show that one vehicle turning to the left required as much time as from four to five vehicles going straight through an intersection or turning to the right. Checks also show that where turning to the left is permitted, one out of six vehicles will make such a turn. These figures will show that eliminating left hand turns will add approximately 50 per cent to the traffic capacity of the street.

The value of any traffic regulations is completely dependent on the efficiency with which they are enforced. There are many devices for assisting the traffic police, and any of them that tend to make the traffic officers' signals better understood, will be of value. The street railway will find that they will profit by the generous use of signs to inform the public where cars stop and what cars stop at each corner. Traffic inspectors to assist the police and the crews are almost indispensable at the most congested corners.

Location of Loading Points

The location of loading points gives one of the greatest possible chances for increasing the traffic capacity of streets. Where there is a branch-off line from the principal street, cars may be loaded on the branch-off street. This will eliminate part of the time used for braking and all of the time used for loading, unloading and accelerating of those cars from the time consumed on the principal street.

Where an excessive number of passengers board the car at a ruling point of greatest congestion, an additional stopping place properly located to divide this number of passengers may increase the traffic capacity of the ruling point.

Double berthing will theoretically double the capacity of a stopping place. There is, however, some mutual interference so that it can never be actually doubled. Safety zones or platforms are almost essential to double berthing in order to keep car space cleared for the second car to reach its position, without having interference from other vehicles.

As said in the beginning, each case of traffic congestion must be analyzed for its possibilities for improvement. As long as tracks in operation can be made to carry more cars safely, more satisfaction in routing will result. The more concentrated the central district, the more people can go directly to their destination. When all the methods enumerated have been used or rejected after an examination of their possibilities, it is time to consider rerouting of lines and additional track capacity.

Vocational Training for Railway Employees*

On This Texas Property a Special Effort Is Made to Treat Each Applicant as an Individual

By C. J. Crampton

Superintendent of Safety and Efficiency, Dallas (Tex.) Railway

AN ADEQUATE system whereby railway trainmen may be taught their duties prior to actual employment involves knowledge of the work they will be called upon to do; knowledge of the proper instructional order in which these duties may be arranged progressively; ability to present these duties in lesson form in an interesting, forceful manner, and familiarity with the prospective trainman that insures him to be the right person for the job.

After qualification requirements have been satisfied, the job must be sold to the worker. Much labor turnover is due to misunderstanding or ignorance of the job before its duties are undertaken.

The systematic method of training workers involves a complete analysis of the job to be taught. The several duties must be broken up and rearranged in such order that their progression represents a connected series of steps in which elemental and fundamental information is first presented

*Abstract of paper presented before the Street & Interurban Railway Section of the Southwestern Electrical & Gas Association, San Antonio, Tex., May 3-6, 1922.

Digitized by Google

as a basis for later practice. On the Dallas Railway property we first analyzed the duties that trainmen will be required to meet, and then arranged these in a graduated series. Then we selected a number of our most capable trainmen to teach the job. These men, called instructors, were then put through a training course in which the teaching order of the various parts of the work was developed, along with the psychological and educational factors that could be used most effectively in presenting the lessons. They were then given an instruction pamphlet, in which the operation of a street car is analyzed.

Instructors first become thoroughly acquainted with their students; learn enough about their past experience, family history, vocational and recreational interests, etc., to form a basis for building their lessons. In many cases an instructor finds after a brief contact with the student that he should seek other employment.

The student is first impressed with the necessity of a knowledge of the city. He then learns all streets over which the lines pass and, along with this, enough about the operation of a car to develop an interest in its mechanical construction and use.

The rules and practices peculiar to the company are mentioned whenever the occasion permits and these are always explained so that the student will know the reason for the practice. He is introduced to the supervisors, inspectors and company officials with whom he will work and no effort is spared to impress him with the friendly, helpful and co-operative spirit of the organization. Inspectors and supervisors become practically instructors so far as new men are concerned.

Usually from fifteen to twenty days are required to master the training program. After successfully completing the training period the student is employed on probation for three months and reports every two weeks to the superintendent of employment and training for a discussion of his work.

The ability of the instructor is graded by the success of his students, and a card catalog is kept in which the records of new men are checked under the instructor's name.

Every trainman is graded monthly and receives a report card indicating the basis of the merits, or demerits, he has received. There is keen rivalry among the men over their grades, and these grades are published every month in *Partners*, our house organ. At the end of the year a summary of grades is made and a special edition of *Partners* carries the pictures of those doing work of the highest grade, etc. The grading system gives a very good basis for promotion.

The trainmen having been selected, the next step is physical examination. This should include a careful examination of sight, hearing, nervous condition and all apparent existing ailments which might affect or render him unfit for work, or at some future time might develop detrimental defects.

The details of platform instruction will, of necessity, vary according to conditions and size of property. The applicant, having passed preliminary and physical examinations, is ready for detailed instruction. It is hardly wise to attempt to crowd too much on a student during his period of training, and it should not be attempted to force on him too much of the mechanical make-up of the street car.

While the student is under the platform instructor, the chief instructor should make frequent trips with him to offer encouragement and suggestions, making the student feel at ease and that a personal interest is taken in his welfare. He should also at this time as far as possible explain to the student the rules and why the rules are in effect. The principal thought should be to have the student learn the proper handling of the car and passengers from an accident standpoint, with courtesy and service being taught by the example of the platform instructor. When the roadwork has been mastered, the student should be given a final examination on rules and operation by the chief instructor. Before the student goes to work the superintendent should give him a final talk on courtesy, service and public relations.

When the student has become a probationary trainman he should be introduced to the car starters and other supervisors under whom he is to work, if he has not already met them. The most favorable impression can be made on the new man if the chief instructor will take pains to spend some time with him on his first few trips alone. Then a six months probation period should be provided, during which time the work of the new employee should be carefully followed. It would be well for all reports of violation of rules during this period to be handled by the chief instructor, particularly the minor ones, which show the unfinished trainman.

Training Platform Men*

The Author Outlines the Procedure in Preparing a New Man for the Responsible Duties Connected With the Operation of an Electric Car—He Cautions Against Confusing the Student With Too Much of Detail

By W. A. Robertson

Superintendent of Railways, Eastern Texas Electric Company, Beaumont, Tex.

THE selection and training of platform men is a science, the fundamentals of which are possessed in some degree by all, and should be studied and developed by those to whose care is trusted the training of platform men for street railway work if competent platform men are to be made. It is only in the past few years that serious consideration has been given to the selection and instruction of platform men; but since it has been realized that this feature is of vital importance to the success of public service work much thought has been given to it and much has been written concerning it. In this problem we have been brought face to face with the realization that the greatest factor in better public relations is vested in our platform men.

In employment department work the size of the organization controls to a great extent the methods to be followed. In all cases the person to whom employment is intrusted must be a good judge of men, and have a forceful personality along with a pleasing and kind manner. Those characteristics should also apply to the men who have charge of the instruction of the students.

The law of first impressions applies very forcibly to the man entering into a new job, hence particular care should be taken to see that his reception is such that the psychological effect will be desirable. The details may vary, but the important thing in starting a new man is to make him feel that he is going to become a member of a happy and contented family and not a mere cog in a machine.

The form of application blank to be used was thoroughly discussed in the report of the American Electric Railway Association committee at the last convention, hence need not be discussed here. If, after a preliminary verbal examination, the applicant appears desirable, he should be allowed to fill out a suitable application form with the necessary references, releases, etc., and his references and past record should be investigated and all data then placed on file. When men are needed they should be selected from the applications on file, for in this manner a greater number can be had to select from, a more intelligent selection can be made, and this should result in a better class of platform employees.

*Abstract of paper presented before the Street & Interurban Railway Section of the Southwestern Electrical & Gas Association, San Antonio, Tex., May 3-6, 1922.

Engineering and Business Education

A SECOND conference* on commercial engineering, to discuss business training of engineers and engineering training for students of business, was held at the Carnegie Institute of Technology, Pittsburgh, Pa., on May 1 and 2, under the auspices of the United States Department of Education. (See ELECTRIC RAILWAY JOURNAL, April 22 issue, page 686.)

Following a discussion in which the subject was viewed from all angles, the following statement was prepared by a committee in order to set forth certain principles which the conference be-

*The first conference was held in 1919.

Digitized by Google

lieved to be expressive of the proper aims and purposes of educational institutions and industrial organizations represented at the conference:

1. It is believed that the engineering profession will be advanced in honor and dignity, and in its capacity to render a maximum of service to humanity, if in the schools a substantial effort be made to impart to students an adequate conception of the broad field of action which is theirs in the realms of production, distribution, and finance.
2. It is submitted that the principal means for accomplishing this aim lies in a continuance of the sound and substantial work of the established schools, supplemented and broadened where practicable by instruction in economics and business subjects and in the basic principles of production or industrial engineering; in which, however, no specific curriculum additions are suggested beyond those recommended by the first conference in 1919.
3. It is recommended that established schools of commerce and business take under serious advisement the policy of supplementing standard curricula by the introduction of work in the elements of engineering, in order that more of the business men of the future may have a sympathetic understanding of construction problems that are fundamental to economic progress.
4. It is believed that much may be accomplished through more active researches in industrial and commercial lines, to the end that systematic scientific methods may be applied in meeting the problems and needs of industry; this with special reference to the elimination of unnecessary wastes, the conservation of material and human resources, and the lessening of production costs of standard commodities of commerce.
5. The conference recommends that colleges of engineering and of business adopt the following procedure in developing business training of engineers and engineering training of business men: (a) Secure the co-operation of industry in defining standard terminology and specifications of the requirements of industry. (b) Analyze the specifications of the requirements of industry to determine what are the fundamentals that must be taught, and organize the instruction accordingly. (c) Study and experiment with ways and means of discovering native bent and of measuring proficiency, that every student may be guided into a career of maximum achievement.
6. We reaffirm the purpose of the committee on commercial engineering of the United States Bureau of Education, and recommend that conferences under the direction of the committee be held at regular intervals.

Southwestern Association Elects Officers

THE Southwestern Electrical & Gas Association and the Southwestern Geographic Division of the National Electric Light Association held joint conventions in San Antonio, Tex., on May 3, 4, 5, and 6. Both conventions were attended by several hundred representatives of utilities represented in their membership.

At the concluding business session of the Southwestern Electrical & Gas Association on Saturday, R. J. Irvine of the Jacksonville (Tex.) Ice & Light Company, was elected president, succeeding C. E. Calder of the Dallas Power & Light Company. Other officers elected are: Joe H. Gill, Dallas Power & Light Company, first vice-president and chairman of the power and light section; Alves Dixon, El Paso (Tex.) Railway, second vice-president and chairman of the railway section; P. E. Nichols, Galveston (Tex.) Gas & Electric Company, third vice-president and chairman of the gas section. E. N. Willis, Dallas, was re-elected secretary and F. G. Ganno, Fort Worth, treasurer.

One of the most important steps taken during the convention of the Southwestern Division, N. E. L. A. was the creation of the Public Utility Information Bureau for Texas, which will be established in Dallas. George McQuaid, veteran newspaper man of Texas and Oklahoma, will be in charge. Members of the committee which had charge of the details of the bureau are: C. W. Davis, Dallas, chairman; George Clifford, Fort Worth; Fred M. Hoag, Dallas; Henry Morris, Dallas, and C. E. Calder, Dallas.

At the first general session on the opening day, Mayor O. B. Black of San Antonio, welcomed the delegates to the city. Bishop J. S. Johnston delivered the invocation and former mayor Clinton Brown delivered an address. Joint sessions of the two associations were held during the mornings, while the various sections met in sectional meetings during the afternoons. Each day's program included addresses, papers and discussions on the live topics and problems of interest at this time to the men engaged on the various utilities in this territory. Two of the papers read at the railway meetings were published in abstract in last week's issue of the JOURNAL. Others are printed in this week's issue; still others will be printed later. Chairmen of the various sectional meetings were: Technical section, J. B. Thomas; accounting section, J. E. Van Horn; commercial section, J. R. McCoy; street and interurban railway section, Alves Dixon.

Provisional Program for A.S.T.M. Convention

THE twenty-fifth annual meeting of the American Society for Testing Materials will be held from June 26 to June 30 at Atlantic City, with headquarters at the Chalfonte-Haddon Hall. The provisional program is as follows:

JUNE 26

Morning—Registration.
Afternoon and evening — Committee meetings.

JUNE 27

9:30 a.m.—Non-ferrous metals, metallography and corrosion.
3:00 p.m.—Wrought, cast and malleable iron.
8:30 p.m. — Presidential address and reports of administrative committees.
9:30 p.m.—Informal dance and smoker.

JUNE 28

9:30 a.m.—Steel.
Afternoon—Committee meetings.
8:00 p.m.—Symposium on impact testing of materials.

JUNE 29

9:30 a.m.—Fatigue of metals, methods of testing and nomenclature.
3:00 p.m.—Coal, coke, timber and shipping containers.
8:00 p.m.—Concrete aggregates, road materials and waterproofing; followed by preservative coatings.

JUNE 30

9:30 a.m.—Lime, gypsum and ceramics; followed by petroleum products, insulating materials, textiles and rubber.
Afternoon—Recreation, including golf and tennis tournaments.
8:30 p.m.—Cement and concrete.

Among the many topics of interest to electric railway men, the following are typical: June 27—Reports of committees on copper wire and wrought iron. June 28—report of committee on steel. June 29—some measurements of the shape of Brinell ball indentation; report of committee on coal; forms of specifications for purchasing coal; a rational basis for coal-purchase specifications; use of excess sand in concrete mixtures; report of committee on concrete and concrete aggregates; physical properties of subgrade materials; some physical properties of paints. June 30—reports of committees on electrical insulating materials, cement and reinforced concrete.

American Association News

Reports and Compilations Issued by Bureau of Information and Service

THE special reports and compilations prepared by the Bureau of Information and Service during April are listed below:

Motor Bus Operating Costs: Compiled from reports to the California Railroad Commission and from the technical press.

Motor Bus License Fees: A tabulation of the registration, license and other fees levied by state and local governments on motor vehicles operating as common carriers. May 1, 1922.

Trend of Material Prices: Information furnished by manufacturers showing relative price trend since 1914 of material used by electric railways.

Weekly Pass Results: A summary of the experience of electric railways with the weekly pass as shown by statistical records.

Trend of Trainmen's Wages, 1914-1921: Shows for a large group of city and interurban companies the number of trainmen employed, the average maximum hourly rate paid trainmen, and the number of years service required to reach the maximum.

Anti-Jitney Legislation: A second supplement, dated May 1, 1922, to a compilation of the same name originally issued May 1, 1921, giving a summary of the developments in the jitney situation throughout the country.

In addition to the above, supplements to the wage and other bulletins have been prepared, bringing them down to date.

Personnel Committee to Draw Up Tentative Set of Elimination Questions

THE problem faced by the T. & T. Association committee on personnel and training, which met in Chicago May 4, was to decide upon some basis which might form a starting point for developing a series of mental tests to be applied to applicants for the position of motormen. There was much disagreement as to what the initial elimination tests for motormen should

FINANCIAL AND CORPORATE :: TRAFFIC AND TRANSPORTATION
PERSONAL MENTION

Favorable Attitude Develops in Akron

Public Approves of Franchise Providing Five-Cent Fare Until 1924—New Viaduct Line to Be Built

Public attitude in Akron, Ohio, toward the Northern Ohio Traction & Light Company has taken an unusually favorable turn in connection with a proposed referendum on a new franchise recently granted by the City Council. Citizen mass meetings are being held protesting against the Council calling a referendum election, as provided for by the charter, to vote on the franchise.

The new franchise, as noted previously in the ELECTRIC RAILWAY JOURNAL, grants the company the right to charge a 5-cent fare until February, 1924, the time when the present 4-cent contract expires, and to construct a new line across the new North Hill viaduct and over Rider Avenue, to intersect its Cleveland line at Cuyahoga Falls Avenue. This provision removes the Cleveland, Kent-Ravenna, Cuyahoga Falls and some North Hill cars from the steep Howard Street hill. It also cuts the running time over these lines from five to seven minutes.

REFERENDUM MOVEMENT STARTED

Immediately following the final passage of the franchise-ordinance by the Council, politicians opposing the company started a referendum movement. A few of their followers, officers in four civic improvement organizations, met and adopted resolutions demanding that the Council order a referendum on the franchise. The Council had announced that a referendum would be called should the people desire. The action of the four officials of the four civic clubs had no sooner been announced than the cry went up from various sections of the city that the 5-cent fare was satisfactory and that the line across the viaduct was wanted.

North Hill citizens took the lead at a great mass meeting at which resolutions denouncing the proposed referendum and supporting the company were adopted. The action was practically unanimous, only two votes out of 750 being against it. Forest Hill and other sections followed suit, the feeling developed in each case being in support of the company. Citizens having no connection with the company went from one section to another demanding that attempts to strangle railway development be stopped. The people arose in unit, denouncing politicians back of the movement and declaring their faith in the company. Volunteer speakers pointed out that the fare was satisfactory and that the cars and service were equalled in few cities of like size.

The only part the company played was to announce it was ready to begin construction work as soon as it could, legally; that is, as soon as the time limit for calling a referendum had expired. It pointed out that a referendum would cause delay.

The feeling evidenced shows rather conclusively that the citizens of Akron —car riders and property owners— want the transportation problem settled and determined to settle it even though it takes mass meetings to do it.

BUS LINES AS FEEDERS TO BE STARTED

One of the first steps in the development will be the new line over the viaduct to the North Hill-Cuyahoga Falls district, over which the Cleveland interurban cars will also be routed at great saving in power and time. The next step will be the establishment of five new bus lines as feeders to the present system. This will be done within the next sixty days.

Cars are now operated to the north over Howard Street, a narrow roadway, having a hill with a grade of 13.5 per cent. The viaduct has only a 1.5 per cent grade. Extreme care has been necessary in the operation of cars over the Howard Street hill in order to prevent accident. The precautions adopted to insure safety there have included the use of block signals and adherence to the rule permitting only one car at a time on the hill. In consequence much time has been lost in operating cars on the line and the cost of operation has been increased inordinately.

Key Route Bay Terminal Approved

The plan for improving ferry service across San Francisco Bay by establishing a terminal on Goat Island, which was recently proposed by the San Francisco-Oakland Terminal Railway, and which was referred to in the ELECTRIC RAILWAY JOURNAL, issue of April 1, has been approved by Oakland merchants and by the Oakland Chamber of Commerce. A resolution passed by the Chamber of Commerce and which is addressed to Federal authorities points out that "such a terminal will be of great commercial value to the communities on the east shore of San Francisco Bay and San Francisco proper and will bring these communities into closer relationship, resulting in mutual benefit." The resolution urges that the application for permission to construct such a terminal be given early hearings and prompt decision.

"Fourteen" Taxpayers Win

Supreme Court Renders Decision Against City Levying Taxes to Pay Operation of Railway System

The "fourteen taxpayers" won their suit, to defend the general fund of the city of Seattle from invasion by the Seattle Municipal Railway, when the State Supreme Court on April 29, handed down a decision which determines that the city cannot levy any taxes to pay for maintenance and operation of the street railway system, nor can it divert any money from the general tax fund to aid the railway by loans without a vote of the people. The decision reverses that of Judge J. T. Ronald in the Superior Court of King County, who held that the city not only has the power to levy taxes for the maintenance and operation of the railway, but that it is the duty of the city to do so should occasion arise.

DIVERSION OF FUNDS ATTACKED

Because the street railway system has been a losing venture and one which would make the return of borrowed funds uncertain, the State Supreme Court held that the city should be enjoined from borrowing from the general fund to bolster temporarily the operation and maintenance funds of the street railway. In other cases involving borrowing from one fund to another, the court has held that such a course could be followed where the income of the fund aided was assured, making return of borrowed money certain. In this case, however, the court ruled, the record of losses of the system under city operation is such as to lead the court to conclude that "the results ultimately will be that the moneys borrowed will be permanently diverted."

The fourteen taxpayers brought their suit in defense of the general tax fund early in 1921, when a loan was made to the railway from general fund moneys to aid in the payment of interest to the holders of the $15,000,000 of bonds given to Stone & Webster for the street car system. The suit was brought to enjoin the city from any further invasion of the general fund in behalf of the railway. In its defense, the city has contended that it has the power to levy taxes for the railway, but is not obligated to do so. Another suit was then brought by the Puget Sound Power & Light Company to prevent the Superior Court from adjudicating the question and in that case, Judge Neterer held that the Superior Court had jurisdiction. He was upheld by the Circuit Court of Appeals and later by the United States Supreme Court.

Louisville Is Proud of These Men

Many electric railways have organized basketball teams among their employees. All of the companies are proud of the men who compose their "fives." There is no electric railway organization, however, that is prouder of its team than is the Louisville Railway. There is every reason why it should be. The men composing the Louisville "five" played some remarkable ball during the past seasons. They won second place in the Commercial League of Louisville, with ten games won and four games lost. The men showed real action all through the season, and every time they played a goodly number of their fellow employees cheered them on. Of course a league of basketball teams among electric railways is out of the question, but if such were possible the Louisville team would undoubtedly be found well up toward the top at the end of the season if not actually at the top. That the men composing the Louisville team are a formidable looking lot is attested by the accompanying engraving. If other teams organized among employees of electric railways that are within easy riding distance of Louisville think they would like to try conclusions with the men from that city, then the Louisville men would probably be more than willing to book games for next season. The names of the men composing the team as shown in the accompanying photo are: Seated in front, C. L. Carlton; first row (seated left to right), Arthur Meyer, William Bunnell, Forest Raley and Maurice Cook; second row (standing left to right), Artis Yager, L. H. Broadus, George Ecken, Joseph Cain and William Schanzenbacker.

LOUISVILLE RAILWAY'S FAMOUS "FIVE"

Commission Recommends Relief for Railway

The Michigan Public Utility Commission has recommended that Sault Ste. Marie, Mich., furnish some relief to the Sault Ste. Marie Railway, which recently asked permission to discontinue service, setting forth that it was losing money monthly. The commission will probably grant the request unless some relief is obtained. The city has already discussed the question but has been unable to agree upon a plan for relief. It is believed, however, that the city will come to some agreement with the company rather than lose its railway line.

Cleveland Wages Go to Arbitration

Whether Cleveland street car operatives are to have their pay reduced 5 cents an hour, as proposed by the Cleveland Railway, is to be decided by a board of arbitration. The men's union, Local No. 268, by a vote of two to one, rejected the proposition of John J. Stanley, president of the company, that the agreement that was in force between the company and the union up to May 1 be continued unchanged except for the 5-cent reduction in pay. The men rejected this proposition even though they understood the refusal meant that a board of arbitration would be formed to settle the question and draft a new agreement.

The old agreement between the company and men was a closed shop contract. Company officials will insist upon the board of arbitration deciding whether any new agreement with the union is to be of a closed shop nature. Union officials now are objecting to the arbitration board considering the closed shop question, but company officials are insistent that inasmuch as the old agreement terminated on May 1 the arbitrators shall also decide whether the new agreement is to include a provision calling for the employment of only union men by the company, as has been the case heretofore.

The union is to name its arbitrator within the next few days and the company is expected to follow suit shortly thereafter. In case these two arbitrators cannot decide upon a third man within ten days, the choice is to be made by Federal Judge D. C. Westenhaver.

Any decision on wages made by the board of arbitration is to be retroactive to May 1.

Wage Conferences End in Agreement

As was reported in the ELECTRIC RAILWAY JOURNAL, issue of May 6, an agreement was reached in Salt Lake City by which the employees of the Utah Light & Traction Company accepted a cut in wages from 50 cents to 47 cents for first-year men and a cut from 57 cents to 54 cents for those longer in service. The scale accepted is about half of the cut at first proposed by the officials of the company, who opened wage conferences about a month ago. The old and the new schedules in cents per hour together with the intended rate after Nov. 1 are:

TRAINMEN

	Old Scale	Present Scale	After Nov. 1
First year's service	50	47	45
Thereafter	50	54	52

CARHOUSE AND SHOPMEN

	Per Hour	
	Old Scale	Present Scale
Painters—		
First grade	59	57
Second grade	46	45
Helpers	41	40
Carpenters—		
First grade	59	57
Second grade	46	45
Helpers	41	40
Welders—		
First grade	59	57
Second grade	46	45
Third grade	41	40
Blacksmiths—		
First grade	59	57
Hammermen	46	45
Helpers	41	40
Machinists—		
First grade	59	57
Second grade	46	45
Helpers	41	40
Armature winders—		
First grade	59	57
Second grade	46	45
Helpers	41	40
Electrical department—		
First grade	59	57
Second grade	46	45
Helpers	41	40
Barnmen and pitmen—		
First grade	52	50
Second grade	46	45
Helpers	41	40
Car cleaners	41	40

TRACK AND ROADWAY DEPARTMENT

	Per Day of 9 Hrs.	
Switch repairers	$4.50	$4.25
Welders	5.50	5.00
Track cleaners	3.65	3.25
Teamsters	3.65	3.25
Bonders and yardmen	3.65	3.25
Trackmen	3.65	3.25

Appreciation was expressed by General Manager Dicke of the manner in which the press of Salt Lake City handled these wage conferences.

Will Settle Wage Differences

Arbitrators have been chosen by the Cincinnati (Ohio) Traction Company and the Union of Stationary Firemen and Oilers to settle a wage dispute. The union's agreement with the company expired on May 1 and negotiations had not resulted in an adjustment. The men now receive 60 cents an hour. The company requested them to accept 50 cents an hour. This is a reduction of 17 per cent from the present wage, but only 4 per cent reduction from the 1919 wage of 52½ cents an hour. The company contends there has been much more than a 4 per cent reduction in the cost of living since 1919.

$218,000,000 Construction Program

Tentative Plans Announced for New Rapid Transit Construction in New York

Plans for seven subway construction projects, to cost $218,000,000, were announced by the New York Transit Commission on May 11. A total of 32.55 miles of new route, with 84.20 miles of track, is provided by this program, which calls for completion of the entire system within five years from the time construction begins.

The new lines are designed to relieve congestion on existing routes, link up new sections of the city with the main subway system and generally put transit facilities a few years ahead of traffic requirements.

Staten Island will be brought into direct rail communication with the heart of Manhattan by a tube under the Narrows, connecting with the Fourth Avenue subway in Brooklyn.

1. Corona-Flushing extension	$2,800,000	3½ years
2. Forty-second Street moving platform	6,000,000	3 years
3. Staten Island tunnel	17-21,000,000	5 years
4. Seventh Avenue-Central Park West subway extension from Fifty-seventh Street	26,500,000	3½ years
5. Long Island City-Brooklyn crosstown	24,000,000	3 years
6. Fulton Street elevated extension (subway) to lower Manhattan	28,000,000	5 years
7. Eighth Avenue-Amsterdam Avenue west side subway, Chambers to 181st Street	69,500,000	3-4 years

To the actual construction charges the Transit Commission adds the money for engineering expenses, preparation of plans and interest of funds spent until the lines are in operation, totaling $44,000,000.

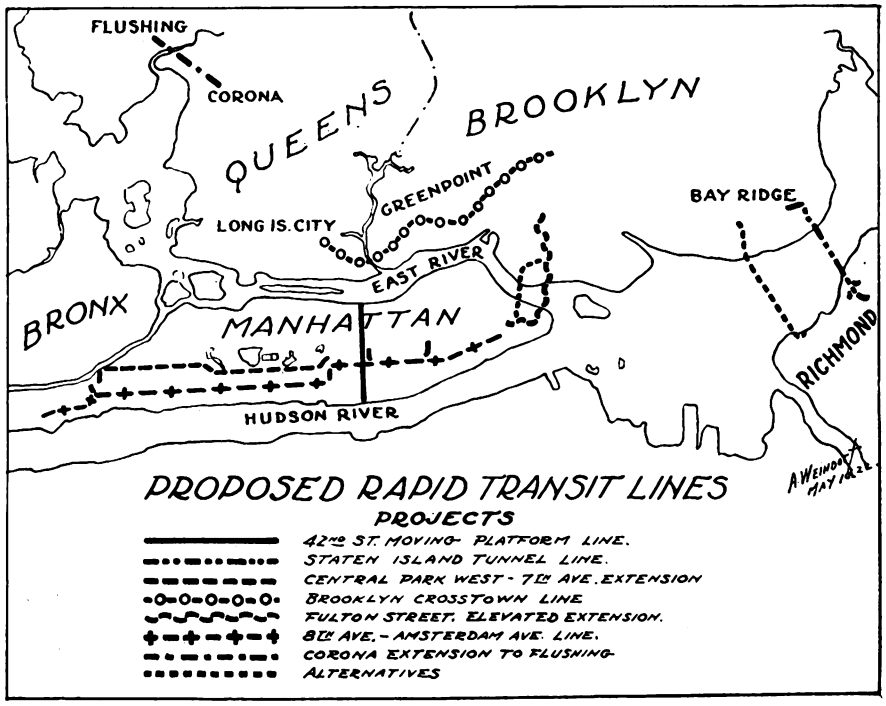
Long Island City will be linked to Brooklyn, and a direct route from Queens to the Coney beaches will be obtained by a new line from the Queensboro Bridge plaza, connecting at Fulton Street in Brooklyn with the Brighton Beach lines.

Relief for Washington Heights and west side Manhattan will be obtained by building the most elaborate subway yet dreamed of along Eighth, Amsterdam and Fort Washington Avenues, from Chambers to 181st Street. It will have eight tracks in the section from Fourteenth to Forty-second Street, affording opportunity for a loop system to take in the new Queens extension along Forty-second Street, the Fourteenth Street-Eastern District line and the Long Island City-Brooklyn subway.

The Lenox Avenue traffic jam will be relieved by extending the present Brooklyn Rapid Transit Broadway-Seventh Avenue line from Fifty-seventh Street north under Central Park West and Seventh and Eighth Avenues as far as 155th Street. This line would get Polo Grounds crowds, and the Transit Commission also explains that its construction would "hasten the time for removal of the Sixth Avenue elevated line."

Shuttle service under Forty-second Street from Grand Central to Times Square will give way to a moving platform equipped with seats, which will be designed to operate from river to river so as to make connection with the seven existing subway and elevated lines and the new Eighth Avenue line. The north and south trunk lines crossing Forty-second Street will have a total of twenty-seven tracks when this new line is built.

Continuation of the present elevated line from Corona into Flushing as a subway is fixed by the Transit Commission as the first project to be started, but it suggests that its entire construction program be started without delay, inasmuch as no new lines have been planned since 1913.



MAP SHOWING DISTRICTS OF THE CITY THAT WOULD BENEFIT BY PROPOSED CONSTRUCTION

A statement of the cost of the new lines and the probable length of time required to complete them is shown in the accompanying table.

The accompanying map shows the territory in which the new lines will be built. All of them, as previously explained, will connect with routes now in operation, but the existing routes are not shown on the map because the map with all the lines, new and old, could not be reduced to printable size.

The several new routes projected will add the following track and route mileage to the present mileage of the dual system:

No.	Classification	Length of Route in Miles	Length of Tracks in Miles
1.	Flushing extension	1.90	5.20
2.	Forty-second Street moving platform line	2.00	4.00
3.	Staten Island tunnel, either alternative	3.20	6.40
4.	Central Park West-Seventh Avenue extension	5.40	12.50
5.	Brooklyn Crosstown line	6.25	12.50
6.	Fulton Street elevated extension	2.80	5.60
7.	Eighth Avenue-Amsterdam Avenue line	11.00	38.00
	Total	32.55	84.20

With the time limitations in view that would be imposed by the time required to build new lines, the commission took up the matter of necessary new construction shortly after its appointment. It has since had under consideration a variety of routes and plans, studied out and prepared, in the first instance, by its consulting engineer, Daniel L. Turner, and from among these, has agreed upon the seven major projects previously outlined as the first to be presented. It will proceed with the formal adoption of the particular routes included, and take whatever other steps are necessary to set the actual work in motion, after opportunity has been given for full public discussion.

Wage Agreement Signed

A wage agreement was recently entered into between the management and employees of the Beaver Valley Traction Company and the Pittsburgh & Beaver Street Railway Company, New Brighton, Pa., which became effective on May 1, 1922, and which will terminate on April 30, 1923. The rate of wages for trainmen in cents per hour is as follows:

First three months	44
Next nine months	47
After one year	53
One-man car operators	5 cents additional

Under Section 1 of the General Order it is agreed that the hours of service will be made as nearly equal as possible on the basis of a maximum of eleven hours and a minimum of eight hours with a 10 per cent leeway. It is understood that the 10 per cent leeway means the total number of hours under eight hours and over eleven hours. Both the management and employees agree to avoid all controversies during the life of this contract.

Interesting Electrification Lectures Being Arranged

L. K. Sillcox, general superintendent of motive power of the Chicago, Milwaukee & St. Paul Railway, has arranged with several of the more important educational institutions of the country for a series of lectures on this property's electrification to be given by technically trained members of his staff. While the lectures primarily are given for the information of students of engineering and the faculty of the various colleges it is desired in addition that they be attended as far as possible by other persons who are interested in this subject. These lectures are illustrated by lantern slides and more than 2,000 ft. of moving picture film. No charge is made for the lectures, but it will be necessary for the organization to furnish a moving picture machine with operator, also lantern slide projecting machine with the necessary screen.

A tentative schedule of lectures on the mountain division electrification by members of the mechanical staff of the railway includes one on May 15 at Minneapolis under the auspices of the Minneapolis Traffic Club, May 17 at Columbus, under the auspices of the Ohio State University, and on May 23 at Lafayette, Ind., under the auspices of Purdue University.

The railway company has issued an interesting and instructive sixty-two-page booklet showing some attractive views of the country traversed by the electric cars, some data on transmission lines, substations, etc. A diagram showing the profile of the Great Continental Divide and Cascade Range with its electrified districts is included in this pamphlet.

Plans for Extension Announced

The first definite step has been taken toward the construction of an extension of the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad from Anderson Ferry, its Cincinnati terminal, to the Dixie Terminal in the heart of the business district. The West End Terminal & Railway Company, which will build the extension, has been incorporated with a capital of $10,000 under the laws of the State of Ohio. The incorporators are: H. Lee Early, grain merchant; Morgan Wamsley, banker; Louis B. Patterson, manufacturer. Dr. John H. Walton and Milton Sayler, attorney, who are residents of lower Ohio River towns, through which the interurban company operates.

A campaign will be launched to dispose of the preferred stock in the West End Terminal & Railway Company to patrons of the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad. Actual work of building the extension, which will be about 6 miles and which will cost approximately $750,000, will be started within thirty days. After the company is organized, the officials will apply for a franchise to operate from the City of Cincinnati. When completed the extension will be operated by the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad. L. G. Van Ness, general manager of the interurban, will supervise the construction of the extension.

Suspension of Service Threatened in Muscatine

Trouble has again broken out between the City Council of Muscatine, Ia., and the Clinton, Davenport & Muscatine Railway, a subsidiary of the United Light & Railways Company. The company on May 9 notified the city authorities that railway service would end and the dismantling of the traction system would begin on May 20 if the city persisted in forcing through a paving program.

This paving program would entail an expense of $50,000 on the company according to a letter of B. J. Denman, president of the railway. This expense, he declared, the company could not afford to bear. He offered to make repairs which he declared would put the lines in good shape for several years to come. But paving between the street car tracks and laying of new trackage the company could not and would not do, Mr. Denman stated.

The city refused to accede to the company's substitute paving and repairs program notwithstanding intimation from President Denman on April 26 that forcing through the paving program would mean withdrawal of service.

The letter from Mr. Denman, dated May 9, goes on to say that the road has for years barely been paying operating expenses and that it has never earned any revenue. The company further offers to remove its equipment prior to May 20 in case the city authorities wish this to be done.

The present controversy grew out of a new city paving program and particularly over the city's insistence that the company pave between its tracks. This situation is reviewed in a letter of last month from President Denman to the Muscatine Council.

Resolution Prohibiting Issuance of Tax-Exempt Securities Reported

The resolution introduced into the House by Representative Green of Iowa proposing a constitutional amendment prohibiting the issuance of tax-exempt securities by federal, state or local governments has been formally reported by the ways and means committee. Estimates obtained by the committee, the report said, showed that tax-free securities now amount to between $10,000,000,000 and $18,000,000,000 and that the right to issue was "a constant temptation to issue in larger amounts than is necessary."

The report said that the present system enables much property to escape taxation, unfairly discriminates between taxpayers, impedes private financing, discourages investment in new enterprises and creates social unrest.

Saginaw Settlement Plan Reported Presented

According to press advices from Saginaw, Mich., George W. Weadock, representing Otto Schupp, trustee for the Saginaw-Bay City Railway, presented to the Saginaw City Council on the evening of May 9 a proposition for settling the franchise questions arising out of the suspension of electric railway service some time ago. The proposal from the trustee came as a result of urging by a committee of citizens and other local bodies. It is understood to have included a plan for the complete elimination of jitneys, restoration of railway service and the operation of buses to the outlying factory districts by the railway. Mr. Weadock said that he would present an authoritative statement covering the proposal to the Council on May 12. On this account consideration of the whole matter was put over by the Council to that date.

News Notes

New Franchise Prepared. — Provisions for regulation of fares at the end of ten years and every five years thereafter are included in the substitute franchise for the Cleveland, Painesville & Eastern Railroad, now being considered by the City Council of Euclid, Ohio. The franchise, if accepted, will run for twenty-five years. The former ordinance, changed at the request of the Council, was for ten years. The new franchise now being considered places the fare at 5 cents in Euclid, and commutation tickets at 2 cents.

Lease Before Commission. — The Frankford Elevated lease now waits on the approval of the Public Service Commission, the document having been indorsed by the City Council and having been signed by T. E. Mitten, president of the Philadelphia Rapid Transit Company and Mayor Moore. If the commission finds no flaw in the provisions the lease will become an actuality by May 13. The lease is for a term of five years with a graduated return to the city of from 1 per cent in the first year of operation to 5 per cent in the fifth.

Dissension Over Two Fares.—A controversy has arisen over the matter of fares on the electric railways in Long Island City that appears likely to reach the courts. Following the separation of the operation of the lines of the Steinway Railway, now in receivers' hands, from those of the New York & Queens County Railway it was announced that a separate fare would be charged by the Steinway Railway with the result that passengers over that line traveling to New York would pay a 10-cent fare. The commission sought to prevent the rearrangement in fares pending an inquiry into the matter.

Financial and Corporate

Chicago "L's" Would Consolidate

Another Railway Readjustment That Makes for Corporate Simplicity in Financial Structure

The Northwestern Elevated Railroad, the Metropolitan West Side Elevated Railway and the South Side Elevated Railroad, Chicago, have filed a petition with the Illinois Commerce Commission for the right to consolidate the several companies into one corporation. These companies and the Oak Park Elevated Railroad have been operated as a joint property for some years, but have retained their corporate identity. This has involved many complications of accounting and financing.

The valuation of the several companies was fixed at $86,250,000 as of June 30, 1919, by the Illinois Public Utilities Commission, this total being made up as follows:

Northwestern Company	$24,941,887
Metropolitan Company	29,215,704
South Side Company	23,013,294
Oak Park Company	9,079,115

Between June 30, 1919, and Feb. 28, 1922, additions were made to the properties to the extent of $432,900, making the total value as of the latter date $86,682,900. The valuation made by the commission excluded property costing $711,204 owned by the company but not used in railroad business.

The Oak Park Elevated Railroad has been in a receivership since Nov. 13, 1911, and a decree has been entered ordering the sale of the property subject to the lien indebtedness of the company aggregating $5,157,862. Of this indebtedness $5,000,000 is represented by the company's first mortgage 5 per cent bonds due July 1, 1928. The Northwestern Company is liable as guarantor for the payment of the principal and interest on these bonds and the mortgage is a lien upon the north side of the union loop. The receiver of the Oak Park Company is indebted as of Feb. 28, 1922, on outstanding receiver's certificates, for power and for accrued interest in the sum of $2,984,581.

The petition states that the petitioners are assured that the holders of these receiver's certificates and other receiver's indebtedness are willing to surrender and cancel them in exchange for $2,600,000 in par amount of the capital stock of a corporation formed by the consolidation of the several companies. The petitioners believe that such a consolidated corporation should acquire the property of the Oak Park Company at a judicial sale subject to the lien indebtedness above mentioned, by issuing $2,600,000 of its capital stock to retire the indebtedness of the receivers, and by paying or assuming other liabilities of about $400,000 of the receiver.

On April 25 the board of directors of each of the companies adopted a resolution expressing a desire that the companies be consolidated into a single corporation, calling a special meeting of the stockholders for the purpose of submitting to their vote this question of consolidation, expressing a desire that the consolidated corporation acquire the property of the Oak Park Company on the terms set forth above, and directing that application be made to the commission for an order approving such consolidation and authorizing the acquisition of the Oak Park Company.

The first board of directors of the consolidated corporation would consist of five men, named in the petition as follows: Samuel Insull, Britton I. Budd, John H. Gulick, S. A. Russell and R. Floyd Clinch. After the consolidation is effected the corporation is to acknowledge and deliver two trust deeds or mortgages of its properties, one securing first lien and refunding mortgage bonds to be issued thereunder, which shall provide for a series of bonds designated "Series A," and dated Jan. 1, 1922, payable Jan. 1, 1947, and bearing interest at the rate of 7 per cent. The other mortgage would be subject and subordinate to the first lien, securing income bonds to be issued thereunder in the aggregate principal amount of $17,120,000, dated Jan. 1, 1922, payable Jan. 1, 1952, and carrying interest up to but not exceeding 6 per cent, payable only if earned. By means of these new securities, the companies would discharge and cancel the following stocks, notes and indebtedness of the several constituent companies:

(a) The entire outstanding capital stock of the Northwestern Company, consisting of 98,908 shares of the par value of $100 each, making a total par value of	$9,890,800
(b) The entire outstanding capital stock of the Metropolitan Company, consisting of 161,703 shares of the par value of $100 each, making a total par value of	16,170,300
(c) The entire outstanding capital stock of the South Side Company, consisting of 102,314 shares of the par value of $100 each, making a total par value of	10,231,400
(d) The outstanding 5 per cent note of the Northwestern Company, dated Aug. 3, 1916 (payable to the order of the company and by it endorsed in blank) in the principal sum of	290,000
(e) The outstanding 5 per cent note of the Metropolitan Company dated Aug. 3, 1916 (payable to the order of the company and by it endorsed in blank) in the principal sum of	620,000
(f) Indebtedness of the Northwestern company for electrical energy	544,683
(g) Indebtedness of the Metropolitan Company for electrical energy	1,055,959
(h) Indebtedness of the South Side Company for electrical energy	426,173
Total	$39,229,315

In exchange for the surrender and cancellation of these stocks, notes and indebtedness, the consolidated corporation would issue $17,120,000 of its income bonds, $19,172,500 of capital stock and not to exceed $1,600,000 of its first lien and refunding bonds of Series A, but only on deposit with the trustees of the first lien and refunding mortgage of an equal par amount of such obligations, as may by the terms of such mortgage be deposited hereunder as a basis for the issuance of these bonds.

Britton I. Budd, president of the several elevated companies, believes that this consolidation will so shape the finances of the companies that it will be possible to purchase 100 new cars at a cost of approximately $2,000,000. If the consolidation is effected this will be an important step in the improvement of the elevated facilities. Plans for these cars have been under consideration for some time and bids on them have been asked.

Sale of Stock to Public Successful

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., recently completed the sale to home investors of a $3,000,000 issue of 8 per cent cumulative preferred stock. The issue, which was placed on sale in June, 1921, was advertised exclusively in Milwaukee and Wisconsin newspapers and was sold out April 13, 1922. To satisfy a continuing demand from small investors, approximately $300,000 of the stock was obtained by the company from large holders and redistributed in small lots between April 13 and April 29.

According to an analysis prepared by the company's securities department, the issue is held by approximately 3,300 women and 5,000 men, a total of 8,300 individual and joint owners, of whom approximately 6,000 live in Milwaukee, 2,170 in 200 other Wisconsin cities and towns and 130 in other states.

The securities department, which also serves the Wisconsin Gas & Electric Company, an affiliated concern, is now selling the last half of that company's recent issue of $500,000 preferred 7 per cent stock. A large share of this issue was subscribed for by 450 officers and employees of the company. When this issue is sold there will be offered for sale another $3,000,000 issue of cumulative preferred stock of the Milwaukee Electric Railway & Light Company identical in character with the 8 per cent issue, except that the dividend rate will be 7 per cent in line with the declining cost of new capital for the public utility business. The issuance and sale of this stock has been authorized by the Wisconsin Railroad Commission.

The two affiliated companies serve the southeastern part of Wisconsin and now have approximately 16,000 investors in this territory and about 18,000 in the entire State of Wisconsin. Both have been pioneers in the sale of securities direct to the public.

2,491,909,178 Passengers

437 Rides per Capita in New York City—Other Interesting Facts in Commission Report

The summary of the report of the Transit Commission of New York City for the year ended Dec. 31, 1921, contained many matters of interest that it was impossible at the time to include in the article "128,321,809 More Passengers," published in the ELECTRIC RAILWAY JOURNAL for Jan. 14, page 85. This is true particularly with respect to figures of traffic handled and earnings.

At the end of the fiscal year, namely, June 30, 1921, there were under the jurisdiction of the commission seventy-one common carriers, of which fifty-eight were street and electric railways, eleven steam railroads and two stage-coach corporations.

The combined capitalization of all companies, that is, the capital stock and bonds at par value, plus certain certificates of indebtedness, etc., was $1,333,972,116. Excluding duplications, the net capitalization was $1,280,662,177, which was an increase over the year 1920 of about $59,000,000. This increase was largely due to the opening of new lines constructed by the city of New York under the dual system contracts. As soon as such lines are opened the bonds issued by the city for their construction are included in the outstanding capitalization of all the companies. The city is now represented in this list by $261,597,725, in securities. There has been some reduction in the gross capitalization of the street railroad corporations, totaling about $1,200,000, the most important items being a transfer by the Interborough Rapid Transit Company from capital to sinking fund, the retirement of mortgage bonds by the Prospect Park & Coney Island Railroad, and the payment of the funded debt of the Fifth Avenue Coach Company. It is interesting to note that the total capitalization of the several companies is nearly double the total in 1907, the year in which the Public Service Commissions were created.

The total increase of traffic on the street railroads for the fiscal year ended June 30, 1921, was 126,321,809. The traffic upon the Interborough Rapid Transit Company's subway and elevated lines increased 58,545,721 and that of the New York Consolidated Railroad Company (B. R. T.) 28,188,005, making a total rapid transit increase of 90,090,535 over the previous year, an increase of 6.33 per cent. The largest single increase was that on the subway division of the Interborough company, which was 53,287,147.

Due principally to a large increase in traveling on the lines of the Third Avenue Railway System, the Boroughs of Manhattan and the Bronx made the largest gain in the number of passengers carried upon the street surface lines. In Brooklyn, however, the surface lines as a whole showed a decrease of 14,829,624 passengers, or a falling off of 3.43 per cent. This de-

Digitized by Google

crease occurred entirely upon the lines of the Nassau Electric Railroad, which showed a loss of nearly 29,000,000. Other surface lines in Brooklyn gained more than 14,000,000. The heavy loss of the Nassau Electric Company was due mainly to the operation of the new Brooklyn line of the Interborough Rapid Transit Company and to the discontinuance of operation on a number of routes, the elimination of transfer privileges and cessation of operation of certain lines during a prolonged strike period. The Borough of the Bronx (Third Avenue Railway System) showed an increase of 13,533,516 passengers, or 14.38 per cent. This was the largest percentage of increase reported by any single system.

The accompanying tables show the number of revenue passengers reported by the different street railway systems, the population of the city and the average number of rides per capita for the fiscal years ended June 30, 1919, 1920 and 1921. They also show the street railway traffic for 1860, 1870, 1880, 1890, 1900, and for every year from 1910 to 1921 inclusive:

While the traffic showed a slight increase as above noted, the financial condition of the companies did not improve during the year. In fact, there was a large increase in the deficit. This deficit for the year ended June 30, 1920, was $10,725,522, while for the year ended June 30, 1921, it was $16,835,756. One of the three tables on page 806 shows the financial results of street railway operation for each fiscal year from 1908 to 1921 inclusive.

May Take Over Traction Line

The Joliet & Eastern Traction Company, Joliet, Ill., instead of being junked may be put in operation again if the efforts of Frankfort business men are successful. The line ceased operation between Joliet and Chicago Heights on April 15 by permission of the Illinois Commerce Commission when it was shown to that body that the road could no longer financially do business. It is said that Will Folkers of Frankfort announced that efforts would be made to buy 52 per cent of the stock of the traction line which is held by Joliet interests. He said that citizens of Frankfort at present hold about 30 per cent of the stock and that if the Joliet holdings could be purchased, the stock would be pooled and the road again placed in operation. The shortening of the road to Matteson and the use of one-man cars were also under consideration. The discontinuance of this service was referred to previously in the ELECTRIC RAILWAY JOURNAL.

Income Increases

A favorable showing has been made by the Louisville (Ky.) Railway for the first quarter of 1922 in comparison with the same period a year ago. Net income for the first quarter of this year was $167,611 compared with a deficit of $26,886 for the same period in 1921. In comparing these figures it is noted that the 7-cent fare was in effect only one month and eight days during that period in 1921. Operating revenues for the first quarter of 1922 were $1,131,106 and operating expenses and taxes were $828,710.

Securities of the railway have strengthened to a marked extent in recent weeks, reflecting the improvement in earning capacity and optimism on the part of officials of the company with regard to the outcome of the fare case litigation. The bonds have advanced steadily and are in strong demand, while the stocks, which are not listed on any exchange, are reported to be showing good advances.

Improved Conditions of New Haven Electric Properties

In its statement on the fiftieth year of operation the New York, New Haven & Hartford Railroad, New Haven, Conn., reports that its trolley properties showed a marked improvement over last year, both in increased revenue and reductions in expenses. This was made possible by the higher rates of fare with some decrease in rates of pay and cost of materials. The income accounts of the Berkshire Street Railway, the Connecticut Company, the New York & Stamford Railway and the Westchester Street Railroad for the year ending Dec. 31, 1921, are given herewith.

Illinois Central Makes First Issue of Stock

Directors of the Illinois Central Railroad have authorized an issue of $10,929,600 of 6 per cent convertible noncumulative preferred stock, series-A, subject to the approval of the Interstate Commerce Commission. This is the initial step in the financing of the vast project of a new terminal in Chicago and the electrification of the lines in Chicago. Approval of a total issue of $50,000,000 by the stockholders for this work was referred to in a recent issue of the ELECTRIC RAILWAY JOURNAL. Additional blocks of stock will be issued from time to time as the work of electrification progresses. The new stock will be offered at par to stockholders on record May 16 to the amount of 10 per cent of their holdings of common stock. It will be convertible at the holder's option into common stock after Sept. 1, 1922, on a share for share basis. It will also be subject to redemption as a whole on any semi-annual dividend date after Sept. 21, 1927, at a premium of 1.5 per cent and accrued dividends.

Road Ordered Sold by Court

Any hope that the Interurban Railway & Terminal Company, Cincinnati, Ohio, might resume operation has ended. Judge John A. Caldwell of the Hamilton County Common Pleas Court has signed an order authorizing the receiver for the interurban company, Charles M. Leslie, to dismantle the properties and sell them as junk, without further order of the court. Judge Caldwell's order was somewhat formal, as a similar order and authorization had been made by the Ohio State Public Utilities Commission.

The Interurban Railway & Terminal Company discontinued operating on March 25. Mr. Leslie said that the rails would be taken up and together with the poles and wires would be sold. All cars, motors, and machinery in power plants and other stations also will be sold. The proceeds will be used to apply to the claim of the bondholders. The discontinuance of operation was referred to in the ELECTRIC RAILWAY JOURNAL, issue of April 1.

Public Is Entitled to All Facts

Following close of arguments begun on April 25, after postponement of one day, Judge H. D. Dickinson of the District Court on May 1 made a verbal order that the Twin City Rapid Transit Company, Minneapolis, Minn., open its minute and account books for inspection by Delos F. Wilcox, traction expert for the city of Minneapolis.

This verbal order was made formal and signed on May 2. It allowed three days in which to hand over the books. The ruling was made in preparation for hearing in a mandamus suit which was set for hearing on May 12, following action instituted by the city in an alternative writ of mandamus on the theory that in mandamus proceedings the court is authorized to grant either side the privilege of inspecting the books and records involved, before the trial.

Judge Dickinson said the Minneapolis Street Railway is being operated under chapter 278 of an act of the Legislature of 1921 and under this statute the motion appeared to be fully warranted. The important provision of the statute reads: "The commission or council have the right at all times to inspect by itself or by its representatives all books, records and accounts and street railway property of any street railway in any city."

The court said:

> Laying all fictions aside the Twin City Rapid Transit Company is the actual owner and supreme authority in the actual operation of the railway system of these two cities, including the suburban lines. Behind and beyond the screen of local legal entities is the master's hand and the master's voice, which cannot be mistaken or disobeyed. In short, the Twin City Rapid Transit Company is subject to the orders of a court of competent jurisdiction for the production of important records in a case of this kind which it might have in its possession and in its control.
>
> The public is entitled to the facts. There should be no secret about it, all should be above board; it is only fair, just and right that all records should be opened up. The public pays the toll, and the statute contemplates that the public is entitled to know what it is paying for.

Records sought by the city include books of the company back to June 4, 1891, of the Minneapolis Street Railway back to July 1, 1873, and the St. Paul City Railway dating from Aug. 30. 1877.

At present the rate is 6 cents. The company has asked 7 cents with four tokens for a quarter. The decision is to be made by the State Railroad & Warehouse Commission under the new Brooks-Coleman act on an appraisal of value of the property, final hearing of which before the commission on presentation by the city and the street railway is expected by the end of July

The St. Paul and Minneapolis lines being linked in the valuation and rate proceedings there is more delay than if there were only one line. In the case of St. Paul the rate hearing has been set tentatively to begin on June 1 before the commission. This is evidenced in a similar hearing for the Duluth line, in which the commission took testimony one day, adjourned, resumed and ended the case in a short time. As yet the Minneapolis city attorney has not moved for dismissal of the mandamus proceedings which are set for May 15, but the hearing is now unnecessary.

President Horace Lowry announced on May 4 that the books of the Twin City Rapid Transit Company would be brought to Minneapolis from New Jersey, and turned over to Delos F. Wilcox, the city's valuation expert, and Neil M. Cronin, the city attorney, for examination. Mr. Lowry said:

> Our counsel feel that there is no reason for producing the books of the Twin City Rapid Transit Company as they have no bearing on the case and are private corporate records, but inasmuch as the present order takes the other view of the matter we have decided not to contest the case any further. One of the main reasons for this decision is that we want the valuation work to proceed as fast as possible and we do not want the public to believe that we are concealing pertinent facts. I hope matters now may proceed rapidly as it is impossible for the company to get in any large amount of new capital until the valuation is fixed.

Net Receipts and Traffic Increase

The total receipts of the Boston (Mass.) Elevated Railway for the month of March, 1922, amounted to $2,868,518 against $2,991,781 for the same month in 1921. The total cost of service was $2,664,186, leaving an excess of receipts over cost of service of $204,332 compared with $200,848 in March, 1921. The total revenue passengers carried in March, 1922, were 30,889,032 against 29,695,375 in March, 1921. The reserve fund required by law was restored on April 1 to the amount of $919,863.

Lower Surplus in Baltimore

The twenty-third annual report of the United Railways & Electric Company, Baltimore, Md., shows a net income of $635,231 for operation during 1921. Total operating revenues were $16,332,865 and operating expenses and taxes amounted to $11,675,440. The surplus in 1920 totalled $1,043,599. According to the report of C. D. Emmons, president of the Baltimore property, this falling off in net earnings amounting to $408,369 was due to unemployment. The company did not suffer so severely as other companies, inasmuch as its decrease for the year was only 5.7 per cent of the gross earnings.

The company put into effect some important economies such as the installation of power-saving devices, additional one-man car operation and was thereby enabled to reduce operating expenses 4.78 per cent. A saving in the matter of wages was effected amounting to between $350,000 and $400,000 per annum.

The records of the safety department show that there were 15 per cent less railway accidents during 1920 than in 1919 and 20 per cent less in 1921 than in the preceding year.

In concluding his statement President Emmons referred to the cessation of dividend payments three years ago and the diverting of available money into improvements and betterments. He said that the result of this plan would eventuate to the benefit of the stockholders.

Mr. Insull Ready to Consider Offer for Elevated Lines

Samuel Insull makes the statement that he is willing to consider the sale of the Chicago elevated roads to the municipality. Mr. Insull has made this offer in writing to the Council subcommittee which is considering transit improvements. He had been invited to attend the sub-committee's session and in acknowledging the invitation said:

> When the plans of your committee take some definite form by way of a concrete suggestion for the acquisition of the elevated roads by the city I will be glad, as I have already told your committee, to take up and consider the matter promptly.

Net Operating Revenue Drops $85,500

The Salt Lake & Utah Railroad, Salt Lake City, Utah, in its annual report for 1921 filed with the Public Utilities Commission of Utah, shows that the company cut its operating expenses by $40,500 under the operating expense total for 1920. During the same period the operating revenue fell off $126,000. Thus the net railroad operating revenue dropped $85,500 for 1921, as compared with 1920.

Gross operating revenues of the railroad were $750,000 during the year. Gross operating expenses were $516,000, leaving the net revenue $234,000. From this were deducted taxes of $71,000, which showed an increase of nearly $6,000 during the year. There were also some increases in non-operating income of the railroad, and the gross income amounted to $167,000, from which interest of $150,000 on bonds, and other interest items totaling $5,500, together with an amortization of the discount on the funded debt of $13,666, leaving the total deductions $170,773.48. The company therefore closed the year with $3,821.27 less in receipts for the year than expenditures.

After paying dividends on its preferred stocks out of its surplus, the company shows a reduction in the corporate surplus of $76,000 during the year.

The Interurban Construction Company is owner of 90 per cent of the stock of the Salt Lake & Utah, other stockholders being prominent business men of Weber, Salt Lake and Utah counties. Total investments in the line are placed at $7,700,000.

Passenger revenue produced $363,000, and freight revenue $321,000. The main line, from Payson to Salt Lake, is 66 miles long, and the Magna branch 9 miles.

Abandon Service

The Ardmore (Okla.) Railway has ceased operation and the single one-man car that had been used for some time has been locked in the carhouse. The original franchise was granted in 1903 to run for a period of fifty years. About eight months ago the line went into the hands of T. B. Snelson as receiver. It is not known whether the property will be junked or another effort made to operate it.

May Be Forced to Discontinue Service

Unless financial assistance is forthcoming at an early date it is likely that the Iron River, Stambaugh & Crystal Falls Street Railway, Iron River, Mich., will have to abandon service. This was the recent ultimatum of F. D. Sullivan, general manager, who stated that during the last two years the company had been operating at a loss. Aggregate losses of $9,000 during the past two years and an electric current bill of $1,900 were made a subject for discussion at a meeting of business men of Iron River to see if some solution could be found.

Car Riders in Toledo Pay Less Interest Rates

According to figures compiled by City Street Railway Commissioner Cann the car patrons of the Community Traction Company, Toledo, Ohio, are paying less interest a mile of track than any of the other five cities in that part of the country where the lines are operated on a service-at-cost plan. In other words, the Doherty interests, which own the Toledo property, are receiving less return per mile of track than are the owners in Cleveland, Youngstown, Rochester and Cincinnati. The comparative figures for the five cities follow:

Capital value of street railway property—Cleveland, $33,495,000; Youngstown, $4,300,000; Rochester, $19,216,000; Cincinnati, $38,067,950; Toledo, $8,500,000.

Miles of track—Cleveland, 376; Youngstown, 52; Rochester, 168; Cincinnati, 282.4; Toledo, 123.6.

Capital value per mile of track—Cleveland, $89,082; Youngstown, $82,692; Rochester, $114,654; Cincinnati, $138,372; Toledo, $68,770.

Population—Cleveland, 920,000; Youngstown, 150,000; Rochester, 297,000; Cincinnati, 401,247; Toledo, 243,400.

Population per mile of track—Cleveland, 2,420.2; Youngstown, 2,865.4; Rochester, 1,772.7; Cincinnati, 1,421; Toledo, 1,969.3.

INTEREST PER MILE

Interest per mile of track—Cleveland, $5,587; Youngstown, $5,502; Rochester, $6,307; Cincinnati, $5,847; Toledo, $4,207.

Interest charges per capita—Cleveland, $2; Youngstown, $2; Rochester, $3; Cincinnati, $4; Toledo, $2.

Total interest per year—Cleveland, $2,100,730; Youngstown, $306,912; Rochester, $1,057,098; Cincinnati, $1,650,937; Toledo, $520,000.

Each semi-annual period decreases the amount of the interest charge paid to the Doherty interests and a proportionate increase is made of payments to the municipal ownership fund. This fund, it will be shown by the commissioner's monthly report to the board of control on April 15, now amounts to just about a quarter of a million dollars.

The Cincinnati interest figures do not include payments on an unfunded debt of $510,541.

Makes Report on Electric Divisions

The electric divisions of the Boston & Maine Railroad, which include the Portsmouth Electric Railway and the Concord Electric Railways, report total revenues of $367,464 for the year ended Dec. 31, 1921. For the year ended Dec. 31, 1920, this item amounted to $403,902. Total operating expenses for 1921 were $315,464 against $357,466 for the previous year. From the net operating revenue of $52,001 tax accruals amounting to $26,766 were subtracted, leaving an operating income of $25,235 in 1921 against $23,121 for 1920.

Line Must Be Self-Sustaining

Abandonment of operation of Route No. 67 of the Philadelphia (Pa.) Rapid Transit Company, popularly known as the Zoo line, has been upheld by the Public Service Commission. The line is a single-track loop 2.48 miles in length with one-way operation.

The case was decided last September, but the opinion is just available through the printed report of the commission. The details of the case are, perhaps, not of so much general interest as are some of the remarks of the commission, in which the fundamentals are laid down that governed its action. The commission said:

> The street railway service must have steady, daily public patronage or it cannot be self-sustaining. The continued operation of one line in a general system that has not such patronage and is not self-sustaining imposes an unjust burden on the rest of the system and its patrons. These principles are fundamental in the street railway business.
>
> Sound economic principles dictate the abandonment of particular lines which cannot be made self-sustaining unless such abandonment results in real, substantial public inconvenience. The determination of the commission in this matter where the complainant is a private individual is made solely with regard to the general convenience of the public. It does not appear from the evidence that the restoration of service along route No. 67 is reasonably necessary for the accommodation of the public.

Financial News Notes

Change in Name Announced.—The name of the Madison Light & Railway Company at Madison, Ind., has been changed to the Madison Light & Power Company.

Sale Again Deferred.—The sale of the carhouse properties of the New York Railways situated in the block from Thirty-second to Thirty-third Street and Lexington and Fourth Avenues has been further postponed until June 8.

Two New Directors at Richmond.—John T. Wilson, Richmond, Va., and Daniel Stafford, New York, N. Y., have been elected directors of the Virginia Railway & Power Company, Richmond, to succeed C. B. Buchanan and Finley J. Shepard.

Net Improves.—The Winnipeg (Man.) Electric Railway for the three months ended March 31, 1922, reports gross earnings of $1,455,787, a decrease of $31,792 over the same period a year ago. The net income is given as $216,620 against $181,199 for the three months period in 1920.

Hearing on Application for Receiver Postponed.—Judge Mayer in the United States District Court at New York has adjourned until May 26 the hearing on applications made by the American Brake Shoe & Foundry Company and Clarence H. Venner for the appointment of a receiver for the Interborough Rapid Transit Company.

Extension at Increased Interest Approved.—The Department of Public Utilities has approved the petition of Worcester (Mass.) Consolidated Street Railway that it be allowed to extend for five years from Sept. 1, 1922, $500,000 of 4½ per cent bonds maturing on that date, the new interest rate to be 7 per cent.

Gold Bonds Offered.—William R. Compton Company and Bond & Goodwin, both of New York, are offering $625,000 of 6 per cent gold convertible debenture bonds of the Texas Electric Railway. The bonds are dated Jan. 1, 1917, and are due Jan. 1, 1942. They are offered at 87 and accrued interest to yield about 7.25 per cent. The St. Louis Union Trust Company, St. Louis, is the trustee.

New Offering Announced.—Bonbright & Company, Inc., Hayden, Stone & Company and the Electric Bond & Share Company are offering $5,000,000 of 6 per cent gold debenture bonds, Series A, of the Utah Power & Light Company, operating the electric railway at Salt Lake City. The bonds, noncallable for twenty-five years, are dated May 1, 1922, and are due May 1, 2022. They are offered at 91 and accrued interest, to yield about 6.60 per cent.

Want to Sell Lines.—Because the Utah-Idaho Central Railroad, Ogden, Utah, has $1,000,000 bonded indebtedness and practically no money in the bank except to meet payrolls, W. A. Whitney, general manager, told the City Council that the company would sell its lines and equipment to the city or any other company. The statement came during a discussion of the paving of two blocks on Twenty-fifth Street. The general manager said the company had not made money for five years and could not undertake the paving.

New Company Shares Offered.—It has been reported recently that the West Penn Traction & Water Power Company, Pittsburgh, Pa., has offered common stockholders of the Monongahela Power & Railway Company $7.50 a share in cash and one share in common stock of a new company to be organized for their holdings, provided at least 78 per cent of the stock accepts the offer by June 10. Proposal seems certain of acceptance as 80 per cent of the stock has already assented. Representatives of the West Penn Traction & Water Power Company have been inspecting the properties of the Monongahela Power & Railway Company at Parkersburg, West Va., and Marietta, Ohio, in connection with the offer of purchase which has recently been made.

Fare Injunction Stands

Louisville Company Wins Before Court of Appeals—Question of Confiscation May Now Be Argued

A decision of the United States Court of Appeals, sitting at Cincinnati, on May 5 was favorable to the Louisville Railway in its long fight for an increased fare. The Court of Appeals affirmed the action of Judge Walter Evans, of the United States District Court, in granting a temporary injunction to the company in February, 1921, preventing the city of Louisville from interfering with the collection of a 7-cent fare by the company. The company argued that a 5-cent fare was confiscatory, while the city argued that the franchise contracts called for a 5-cent fare.

The higher court returned the case to the district court with the suggestion that changes be made in the enjoining order, and fares be reduced if it can be shown that there has been a reduction in operating expenses which would warrant such action.

This leaves the status as regarding the public the same as when the temporary order was issued fifteen months ago. For the present the company will continue on a 7-cent fare basis, and issue the receipt check for the extra charge of 2 cents.

RECOMMENDS DISTRICT COURT HEAR CASE

The upper court refused to disturb Judge Evans' decision, but recommended that the case be heard in the local or district court on its merits as soon as possible. This will probably not be for some time, as the mandate of the upper court will not be sent to the district court for thirty days.

The principal question before the Court of Appeals was:

Is the company limited by an enforceable contract to a 5-cent fare or is there no such existing contract? The controversy grew out of the situation thus created.

The court ruled on this point as follows:

> It follows, we think, from the conclusion that the rate contracts were not extended by the ninety-nine year extensions of the railway charters, and the company, which is lawfully occupying the streets under legislative authority therefore, is not bound by a rate of fare, in fact, confiscatory, but has the right to invoke relief against the enforcement thereof.
>
> The evidence introduced by the company made a *prima facie* showing of a confiscatory rate, justifying judicial discretion in favor of the order of the court.
>
> We think the interests of both the company as well as the public, generally, will be best served by giving immediate opportunity for fully trying out the merits of the claimed confiscation.

The court said regarding charters of the group of small railways which were merged and consolidated so as to form the present Louisville Railway:

> After mature consideration we are of the opinion that whatever may have been the effect of the original rate contracts with the city, either alone or as affected by the (state) statute of 1856, or of the acceptance by the company of the constitution of 1891, such rate contracts were not extended by the act of 1886, and had expired before the present controversy arose.

It is very probable that the argument will be prolonged concerning the value of the lines and property and necessary earnings.

J. P. Barnes, president of the Louisville Railway, on May 4 made a statement to the press in which he said:

> The decision means a guarantee of good service to the city of Louisville. We will be able, after proving our value in the District Court, which we can now proceed to do, to arrange for necessary funds so as to provide improvements and equipment which has long been needed, and to rehabilitate certain portions of the property so as to give Louisville the 100 per cent service to which it is entitled and which has so long been the ideal toward which we have been striving.

BETTERMENT PLANS DEFERRED TEMPORARILY

Plans of the company for improvement will not be undertaken until the matters in hand are threshed out in the district court, and the company knows exactly where it is.

The company's contention as restated by the court in the course of its decision follows:

> 1. That no valid and enforceable rate contracts were effected by the charters of the respective railways and the amendments thereto, and the ordinances and contracts made between the companies and the city for the reason, among others, that such contracts were beyond the powers of the city and whether or not they are affected by the Act of 1876, which act, however, the company contends, of itself prevented a suspension by contract of the rate-making power.
>
> 2. That even if such asserted rate contracts were orginally valid and enforceable all expired by their terms many years ago, their life not having been protected by the extension act of 1886.
>
> 3. That even if such contracts were originally valid and enforceable and even if validly extended under the act of 1886, they were abrogated by virtue of the Constitution of 1891, and its acceptance by the railway company through the reservation to the state of the rate-making power.

In its review of the situation presented with respect to the matter of the alleged contract the decision of the court was in part as follows:

> In view of the conclusions reached as to the non-existence of rate contracts, we think the interests of both the city and the company, as well as the public interests generally, will be best served by giving immediate opportunities for fully trying out the merits of the claimed confiscation.
>
> Upon this subject we of course can have no opinion, nor are we called upon to decide what steps are necessary to be taken affecting a new rate contract. Apart from the one question of law, which we have passed upon, the entire merits of the case are open to further hearing below.
>
> We may add what is of course obvious, that the court below may properly entertain and decide any application which the city may make to modify or vacate the existing injunction, whether based on a showing of lessened cost of operation or upon a fuller showing of the controlling facts than the city has yet had an opportunity to make or upon both; and that in the absence of further rate contracts, the injunction ought not to be continued in aid of any rate higher than reasonably necessary to meet temporary conditions as they may vary from time to time.

Five-Cent Fare Contracts Upheld

For the second time within eight months the Supreme Court has upheld the 5-cent fare contracts of the city of College Park and the town of Decatur with the Georgia Railway & Power Company, Atlanta, Ga. At the time of the first decision the company redeemed all rebate slips outstanding which were given to passengers to cover the 2-cent difference pending the final decision of the court.

When the State Railroad Commission allowed the railway to charge a 6-cent fare on its lines in Atlanta, the city of College Park and the town of Decatur objected to the payment of 6 cents on those lines on the ground that they possessed contracts which provided for a perpetual 5-cent fare. Later the fare in Atlanta was raised to 7 cents by the commission while the litigation of Dectaur and College Park was pending.

HIGHER COURT AFFIRMS DECISION

In Fulton Superior Court an injunction restraining the company from charging 7 cents was issued by Judge John T. Pendleton, but a supersedeas was granted allowing the company to charge the increased fare provided rebate checks for 2 cents were given to each passenger to College Park. In similar proceedings brought in the DeKalb Superior Court before Judge John B. Hutcheson, a temporary injunction restraining the company from charging a 7-cent fare was granted. Judge Hutcheson, however, declined to grant a supersedeas permitting the company to charge 7 cents pending a decision of the Supreme Court.

Both interlocutory injunctions were appealed to the Supreme Court by the railway. The Supreme Court affirmed the decisions of the lower court and under the decision the company had the right to accept the decision or to demand a trial by jury. In order to appeal the case to their United States Supreme Court, if desired, it was necessary that company obtain a verdict from a jury and also a final decision in the Supreme Court, and it was for this purpose that the case was carried to the Supreme Court the second time. This controversy has been referred to previously in the ELECTRIC RAILWAY JOURNAL.

"Bringing In" Customers

What is considered an innovation in selling campaigns was put into effect in Houston, Tex., upon two different occasions with success and promises to continue as a medium of stimulating sales. In order to bring customers into its store—literally speaking—the Foley Brothers Dry Goods Company chartered extra electric cars on each of the eleven lines to carry free of charge all those who cared to make the trip to the city. The event was the weekly "Dollar Day," when one dollar bargains were the chief attraction.

Hearings on Five-Cent Fare Concluded

The public hearing before the Dallas City Commission on a proposal to order the Dallas (Tex.) Railway to restore a 5-cent street fare in Dallas was concluded recently. Members of the City Commission took the proposal under advisement, and it was not indicated when a decision would be rendered, nor whether the traction company would be permitted to charge a 6-cent fare or would be ordered to restore the 5-cent fare. The hearing came to a sudden and unexpected conclusion, after having occupied more than two weeks, during which time the financial standing of the Dallas Railway, its earnings and expenditures for the last several years, and other questions bearing on its earnings and earning capacity were considered.

The hearing was ordered by the City Commission when it was disclosed that the Dallas Railway directors were paying out in dividends claimed to have been earned in previous years the surplus earned under the 6-cent fare in excess of the authorized 7 per cent on the invested capital. The city claimed the traction company had been granted the 6-cent fare under the agreement that all surplus earnings would be used in street paving along its tracks, and that this agreement had been violated. It was found that more than $100,000 had been paid out in past-earned dividends from the excess earnings of the company.

Joe A. Worsham, attorney for the company, presented a short resumé of the points brought out in testimony during the hearing as the final feature of the session. He said that the company did not want to be placed in the position of appearing to make threats or of antagonizing the city officials in any manner.

The statement of William M. Holland, president of the Dallas Railway, that he believes the corporation stockholders will return the $110,000 taken from the surplus reserve and applied to unearned dividends, if the city officials will retract their charges that the company broke faith with the city in the disbursal of the funds, was the outstanding feature of the all-day session of the franchise hearing at the City Hall.

Since this is the issue about which the hearing was called, the city claiming that the company breached faith in not using the money for improvements and extensions, it is believed that the differences between the company and the city will be compromised and that some definite understanding will be made as to the disposition of the surplus in the future. Mr. Holland, however, stressed the fact that he would not commit the company on any matter until he had discussed the proposal with A. S. Grenier of New York, who has already figured in the hearing, and with the company's stockholders.

In reply to a question from Mayor Aldredge as to whether the $110,000 would be returned to the treasury, Mr. Holland said he did not think the stockholders of his company would contradict their previous decision as to the use of that particular sum.

The Commissioners expressed themselves variously concerning Mr. Holland's proposal. Finance Commissioner Blaylock characterized it as a reasonable one, and stated that a clear avenue to an understanding had been opened.

Jitneys Eliminated—Railways to Consolidate

Jitneys were emphatically turned down by citizens of Spokane, Wash., in favor of the electric railway at a special election held on May 2. The vote was 15,495 to 7,204. The charter amendment now approved will eliminate jitneys on Dec. 31, 1922, and make possible the consolidation of the local railway lines of the Spokane & Eastern Railway & Power Company and the Washington Water Power Company.

Application for a franchise to run for twenty-five years was made by the Spokane United Railways, the successor company under the consolidation, on May 5, three days after the election. This franchise was given its first and second readings at meeting of the City Council on May 8. The new company will take over trackage and equipment of both the Washington Water Power Company and the Spokane Traction Company, included in the system of the Spokane & Eastern Railway & Power Company. Parallel lines are to be eliminated according to the agreement reached with the City Council prior to the election. A 6-cent ticket with universal transfer is to go into effect on June 30 in place of the present 8-cent fare and no transfers between the two systems. Details of the jitney-railway controversy were outlined in the ELECTRIC RAILWAY JOURNAL, issue of April 15.

Recommends Car Ownership on Basis of Car Miles Run

That it will be necessary in order to get an exact distribution of fares on the interurban lines between Minneapolis and St. Paul to put in two fare boxes is a conclusion in the report of Delos F. Wilcox, valuation expert to the City Council. At present fares are collected on entrance in either city where cars are bound out and on exit on cars bound in, the same Johnson box being utilized in both instances.

He also concludes that the interests of the Minneapolis car riders will be protected if the State Railroad & Warehouse Commission in the distribution of these fares, now a subject of controversy between the two cities as to the proper allocation of expense of operation charges, will assign the ownership of the street cars on the basis of car miles run, or on the basis of the present property tax listings. He said the cars on the Twin City Rapid Transit system number 1,030, of which 572 are allotted to the Minneapolis Street Railway and 425 to St. Paul, 33 being assigned to the suburban company.

Reduced Fare Fight to Be Pushed

The fight for reduced fares in Fort Worth, Tex., will be pushed, and hearings before Judge N. A. Dodge, referee, will likely begin at an early date, according to R. E. Rouer, corporation counsel for the city. Fort Worth had dropped the fight pending settlement of the Galveston fare case, and now that the United States Supreme Court has upheld the 5-cent fare in that city, Fort Worth officials are ready to press the fight for reduction in fares in Fort Worth. The Northern Texas Traction Company has been collecting a 7-cent fare for more than a year despite all efforts of the city to force a reduction. George H. Clifford, vice-president and general manager of the Northern Texas Traction Company, has expressed a willingness that the questions of earnings of the traction company be gone into thoroughly. He says the traction company is ready to cut fares if it is found that earnings under the 7-cent fare will warrant, but declares that a cut can only be made at the expense of service, that if fares are reduced, service must be curtailed proportionately.

The hearings before Judge Dodge as referee in the Fort Worth case were begun under a former city administration, but the matter was permitted to remain in *statu quo* pending settlement of the Galveston case, as it was admitted that the issues in the two cases were almost identical.

Low Fare Measure Reappears

Rejection of the Erickson electric railway tax scheme at Seattle, Wash., has brought discussion of a 5-cent fare to the forefront of city affairs. As noted in the ELECTRIC RAILWAY JOURNAL for May 6, Mr. Erickson had proposed that the Seattle Municipal Railway be operated at a 3-cent fare and that any deficit in operation be met by taxation.

E. J. Brown, the Mayor-elect of Seattle, has pledged himself to a reduction in fare and two of the new members of the City Council are publicly pledged to work for a reduction.

It was estimated that the Erickson plan would have added $5,000,000 to the city tax levy, or nearly double it, with the consequent discouragement of new industries, and business building.

As a matter of fact the Erickson bill was erroneously called a "3-cent" fare proposition. Mr. Erickson's proposition did not state any specified fare. Councilman E. J. Erickson, father of the bill, estimated that with only the costs of betterments and extensions and payment of interest and principal out of the receipts of the lines, a 3-cent fare could be established.

There is now a clamor in the city for a reduction in fare, and a feeling that a 5-cent fare could be re-established. It has been announced that immediately after the new Council meets in June, a bill will be introduced providing for a 5-cent fare.

Personal Mention

C. M. Benedict Leaves Charleston for Des Moines

Clarence M. Benedict, vice-president of the Consolidated Railway & Lighting Company, Charleston, S. C., has resigned to take up new work as vice-president of the gas company at Des Moines, Iowa. Mr. Benedict has been associated with the Charleston company for twelve years, first as assistant secretary and assistant treasurer, and since 1917 as vice-president. He has also been general manager.

There was a banquet in Charleston in honor of Mr. Benedict and E. C. Stothart, commercial agent of the company, who is also taking up work elsewhere. Employees of the company, who enthusiastically acclaim Mr. Benedict's powers, presented to him a watch. At the banquet it was made evident what a strong hold Mr. Benedict had gained in the interests of the company, the employees and the residents of the city.

Mr. Stuart Cooper will take Mr. Benedict's place. He was recently elected a vice-president of the company. Mr. Cooper has been with the Charleston Consolidated for several years. F. A. Bailey was recently made superintendent of transportation.

C. A. Brann Studies to Please the Public

Giving the public what it wants, the ethics of which in the newspaper world has been argued since papers were first published, is to be the sole task of Charles A. Brann, head of the newly created traffic department of the Houston (Tex.) Electric Company. In the railway field there is no question of ethics attached to giving the public what it wants. Every company wants to do it. Every company strives to do it. The degree of success depends on how accurately it knows those wants.

This is the conviction of Mr. Brann, who is to find out what the public wants, then give just that.

Mr. Brann proposes to accomplish his work by talking before the clubs of the city. The company has invited all associations to have Mr. Brann discuss their service needs with them. The Parent-Teacher associations and the civic improvement clubs will be interviewed first. Thus the needs of individual sections of the city will be taken care of and the general transportation conditions built up as well. Mr Brann believes that if he takes the riders into the company's confidence both rider and company will profit.

Mr. Brann was formerly claim agent of the El Paso Electric Railway.

C. R. Firth has been appointed freight agent of the Fast Freight Line of the Public Service Railway, Camden, N. J. His headquarters are at Trenton. Mr. Firth was formerly traffic manager of the Charles Beck Company of Philadelphia, and has had long experience in the freight business.

W. H. Forse Resigns

Has Been Secretary and Treasurer of the Indiana Traction Company for Fifteen Years

After fifteen years as secretary and treasurer of the Union Traction Company of Indiana, Anderson, Ind., William H. Forse, Jr., has resigned. The resignation will take effect June 1, and thereafter Mr. Forse will devote his time to his other business interests, which include a manufacturing company in Anderson. His successor has not yet been named.

W. H. FORSE

The name of Mr. Forse suggests immediately electric railway auditing and accounting and brings to mind his continuous efforts to clarify and standardize the accounting methods of interurban railways. As early as 1907, when he was selected as one of three accountants to devise a system of accounting for interurban railways by the American Electric Railway Accountants' Association, Mr. Forse showed that he had developed methods and ideas which could not help but effect an advantageous accounting change when applied.

That he had theories and ideas and could expound them convincingly to others was plainly evident, for he was later appointed the representative of all interurban railways on the committee of five accountants, all members of the Committee on Standard Classification of Accounts, who worked to devise a system of accounting for railways under the jurisdiction of the Interstate Commerce Commission. The commission refers all questions to this committee. Mr. Forse has been a member since its formation.

It was only natural that Mr. Forse, with his highly specialized knowledge, should be elected as president in 1910 of the Central Electric Railway Accountants' Association and in 1910-1911 as president of the American Electric Railway Accountants' Association.

Mr. Forse has long been author of articles on depreciation, sinking funds and other technical subjects, but, like the guest who wasn't satisfied until he had "a leg, a wing, a thigh, and a piece more" of the chicken, Mr. Forse wasn't satisfied until he had done even greater things. He thereupon wrote "Electric Railway Auditing and Accounting," to appease that hunger for working hard and accomplishing results. This book, published by the McGraw Publishing Company in 1908, spread Mr. Forse's reputation a bit farther and intrenched him a bit deeper in the electric railway world.

While doing all these things, Mr. Forse was actively carrying on his duties with the Indiana Traction Company. He began his work there in 1903, and in 1906 was made auditor. The next year came his election as secretary and treasurer.

J. E. Cochran, for eighteen years superintendent of lines and stations on the Ohio Electric Company, Springfield, Ohio, has resigned.

Peter M. Miller, assistant treasurer of the Jacksonville (Fla.) Traction Company, has resigned to accept a similar position with the Eastern Texas Electric Company at Beaumont. Both the systems are under the management of the Stone & Webster Corporation.

Preston S. Arkwright, president of the Georgia Railway & Power Company, Atlanta, has been selected to deliver one of the four main addresses before the international convention of Rotary Clubs at Los Angeles, Cal., June 4 to 10. Mr. Arkwright will speak on the afternoon of June 8. His subject is "Business—The Rotarian's Opportunity to Serve Society."

Obituary

R. C. Leeper, superintendent of the Reno (Nev.) Traction Company, died April 27 in San Francisco, Cal.

Edward B. Cramp, who was on the staff of the Interborough Rapid Transit Company, New York, N. Y., for many years, died some time ago. He retired from active work with the Interborough company five years ago.

Robert C. Maxwell, 67 years old, retired president of the Cincinnati (Ohio) Railway Supply Company, died in Cincinnati, April 5, after a lingering illness. He retired from active business life ten years ago. Mr. Maxwell was a brother of Lawrence Maxwell of Cincinnati, an attorney, who was Solicitor-General under the administration of President Grover Cleveland.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

American Exporters Are Unduly Alarmed

German Competition in South America Not Dangerous—Feeling Toward United States Improving

While South Americans do trade with Germany, they have experienced many disappointments connected with late deliveries, inferior material, and, recently, by increases in invoice values of accepted prices, according to F. de St. Phalle, vice-president of the Baldwin Locomotive Works, in charge of foreign sales, at the ninth national foreign trade convention in Philadelphia on Thursday. This, he declared, tends to bring about greater consideration and better feeling toward the United States.

"The future holds out bright prospects for South America and for the United States," said Mr. de St. Phalle. "South America will develop at an increasing rate because it is the most attractive and richest of the thinly populated sections available. In addition to the future development of South America being greater, a larger proportion of this development will be financed and carried out with the assistance of the United States. Economic factors governing the movements of exchange are now better understood in South America and the many loans recently issued from New York to South American countries, coupled with the rising tendency of exchange, have greatly improved the feeling. In the future South America looks to increasing growth carried out to an increasing extent with the assistance of American financial, engineering and business co-operation, all of which is being prepared for at this time.

"With the general recovery of trade, South American exchanges may be expected to rise; some of them have already done so materially. The Argentine will unquestionably return to gold exchange within a comparatively short time."

Mr. de St. Phalle does not believe that everything connected with the United States export trade to South America has been poorly handled; on the contrary, he thinks that great progress has been made and will continue to be made. South America, in his opinion, offers the best field for exportation for the United States today and should receive the most careful consideration of exporters. A notable rise in wealth and efficiency is taking place there now. The future is exceedingly bright but cannot be taken advantage of without hard and efficient work on our part. Purchasers in South America know their business and expect service. They know good service when they receive it, and a good healthy business can be built up on the basis of faithful service just as it has been done in the United States.

Illinois Central Raises Funds to Electrify

The Illinois Central Railroad asked the Interstate Commerce Commission today to authorize the issue by it of $10,929,000 in preferred stock, which it will sell to procure funds for beginning electrification of its lines in and around Chicago. The total cost of the work, which the railroad has decided to put under way, the application said, will be $86,000,000, a part of which will be financed by preferred stock issues and the balance taken from earnings.

Copper Price Advances

Copper displayed a firmer tone in the market and leading producers advanced their price to 13¼ cents a pound, the highest price reported in several months. The high record of this year was 13§ on Jan. 3. The advance bears out predictions of last week that, as soon as all the 13-cent metal held by small dealers was disposed of, there would be a hardening of prices. Producers expect the price to reach 15 cents or more before the turn of the half year.

Large Wood Preserving Company Organized

Organization of the Baker Wood Preserving Company of Washington Courthouse, Ohio, was completed the first of May with the incorporation of the company for $300,000. The company, which was formed for the purpose of purchasing, creosoting and selling ties, piling, lumber, etc., is headed by C. E. Baker, who is also president of the Springfield & Washington Railway, operating between Springfield and South Charleston, Ohio. The other officers are: Will E. Dale, vice-president; Langford Johnson, secretary-treasurer, who with M. S. Daugherty, J. M. Baker and Attorney N. P. Clyburn comprise the board of directors.

The company already has on hand orders to keep the plant operating at capacity for several months. The plant at Washington Courthouse covers fifty-five acres of land, of which fifty-one acres are devoted to storage. It has also contracted for extensive timber acreage in southern Ohio and Kentucky. It is expected that more than a million ties will be handled by the company during its first fiscal year. It was necessary to install 6 miles of track to take care of the switching which will be necessary around the plant.

The company purchased a huge metal treating tube from the Worthington Pump and Machinery Company of Cudahy, Wis., which will be used in the treatment of ties. This tube is now being installed. Some idea of the size of the tube may be gleaned from the fact that it required four flat cars for its transportation in one section from Wisconsin to Ohio. The giant tube is 144 ft. long and 7 ft. in diameter and weighs 175,000 lb.

The tube has a capacity of 1,400 ties in eight hours. The ties are loaded on sixteen tramcars and pushed into the tube, which is then sealed. Five thousand gallons of creosote oil is then turned into the tube under pressure of 200 lb. The oil is kept at a temperature of 190 to 196 deg. It requires four hours for the complete treatment of "each batch." Storage tanks with a capacity of 250,000 gal. of creosote oil have been erected on the company's property.

American Equipment for France and Italy

Copper and electrical manufacturing companies are expected to profit measurably by the decision of the managements of leading French roads as well as some in Italy to electrify their lines. Owen D. Young, vice-president of the General Electric Company and chairman of the Radio Corporation of America, returned this week from abroad with considerable information on those plans. Practically all of the new rolling stock of French roads will be electric, he said, and the Paris & Orleans has recently placed an order for about $14,000,000 of electric locomotives and other equipment, a portion of which will go to the Westinghouse and the General Electric companies. Italy, he said, is making rapid strides in that direction and is converting her water power into electrical energy as never before. Copper men are particularly gratified by that development because of the huge copper surplus in this country a year or so ago; a large proportion has since been sold and most of the remainder is in the hands of the Copper Export Association for shipment abroad.

Metal, Coal and Material Prices

Metals—New York	May 9, 1922
Copper, electrolytic, cents per lb.	13.00
Copper wire base, cents per lb.	5.25
Lead, cents per lb.	4.90
Zinc, cents per lb.	5.387
Tin, Straits, cents per lb.	30.625
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$5.625
Somerset mine run, Boston, net tons	3.375
Pittsburgh, mine run, Pittsburgh, net tons	1.85
Franklin, Ill., screenings, Chicago, net tons	3.00
Central, Ill., screenings, Chicago, net tons	2.00
Kansas screenings, Kansas City, net tons	2.625
Materials	
Rubber-covered wire, N. Y. cents per lb.	5.75
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$1.97
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	96.00
White lead, (100-lb. keg), N. Y., cents per lb.	12.25
Turpentine (bbl. lots), N.Y., cents per gal.	92.00

Digitized by Google

Rolling Stock

Portland-Lewiston Interurban Railway, Lewiston, Me., has now on order two WH304 railway motors complete for spares and one Sheffield-40 motor section car.

The Interstate Public Service Company, Indianapolis, Ind., recently ordered from the American Car & Foundry Company three box cars which will be used to take care of additional freight business.

Interstate Public Service Company, Indianapolis, Ind., has placed orders and equipment is in process of construction for five double-truck, single-end, one-man safety cars weighing 24,000 lb. each; also for six new stock cars and fifteen new box cars of 60,000 lb. capacity each.

Georgia Railway & Power Company, Atlanta, Ga., recently placed an order for twenty forty-eight-passenger double-truck cars which can be used for either city or interurban service. They are equipped with multiple-unit control. The trucks have 26-in. wheels and the equipment comprises four 35-hp. motors. All of the trucks and ten of the bodies are to be furnished by the McGuire-Cummings Company, Chicago, and the remaining ten bodies will be built by the Cincinnati Car Company.

The Elevated Railroads, Chicago, Ill., are planning to purchase 100 new cars for use on the various lines. These will probably be of an all-steel design, very similar to the 250 arch-roof steel cars purchased in 1914 and 1915. Bids have been asked for on these cars, though their actual purchase is probably contingent upon a consolidation of the several elevated companies into a single corporation, for which a petition to the Illinois Commerce Commission was made on May 2.

Track and Roadway

Portland-Lewiston Interurban Railway, Lewiston, Me., is now engaged in raising the grade of the track an average of 12 in. for a distance of about four miles.

Interstate Public Service Company, Indianapolis, Ind., has placed orders for 1 mile of new 80-lb. A.S.C.E. Section T-rail with angle bars complete and for special track work amounting to $4,108.

Toronto (Ont.) Transportation Commission was scheduled to begin on May 8 the rehabilitation work on the section of Bloor Street between Spadina on the east and Ossington on the west. King Street between Church and York was to be thrown open to traffic on May 9.

Worcester (Mass.) Consolidated Street Railway is planning to start shortly on the replacing of rails and the general overhauling of the road bed on various lines along its system in Worcester. Its own "gang" will do the work, which will cost about $200,000.

Brooklyn (N. Y.) Rapid Transit Company is working on the reconstruction of the Jamaica Elevated Line between Alabama Avenue and Cypress Hills to permit the operation of trains made up of the subway type of cars on the Jamaica line east of Alabama Avenue.

Hannibal Railway & Electric Company, Hannibal, Mo., has received permission to remove its tracks from St. Mary's Avenue and has been granted a new franchise to extend its lines to within 5 ft. of the city limits on Pleasant Street over a new route. The new line starting from Chestnut Street and Lamb Avenue will practically parallel St. Mary's Avenue a block south and west.

Savannah (Ga.) Electric Company, to give better service and to enable the Daffin Park crowds to be handled more efficiently, will construct 1,400 ft. of track on Ott Street from Anderson to Thirty-fourth Street and thence to the present track on Waters Road. This will provide virtually a double track between Ott and Anderson Streets and Thirty-fourth and Waters Road. This construction work will start very soon, together with work on Bay Street in preparation for the paving work contemplated there.

Power Houses, Shops and Buildings

Portland-Lewiston Interurban Railway, Lewiston, Me., has recently purchased and is now installing one 500 kw. railway synchronous converter, 600 volts d.c., and the complete station equipment for its operation.

Texas Electric Railway, Dallas, Tex., has opened its new interburban depot at Van Alstyne, Tex., which was erected to take the place of the station destroyed by fire on Dec. 24, 1921. The new station is of brick, considerably larger than the former building.

Union Street Railway, New Bedford, Mass., has let the contract for the installation of a large turbo-generator unit converter and condenser in its Harbor Front power plant. The turbo-generator will have a capacity of 2,500 kw., and the converter will have 2,500 kw.

Los Angeles (Cal.) Railway will tear down its two-story brick building at Division 1 which housed the first electrical equipment of the system. The space will be used for storage track. Additional trackage will be laid to relieve congestion which has been a problem at the Division 1 carhouse for some time. Tracks and switches will be arranged so that cars will pull in and out from Central Avenue.

Baton Rouge (La.) Electric Company has announced plans for the installation of a 1,500 kw. unit at an estimated cost of $180,000. The present capacity is 1,500 kw. Approximately $34,000 will be spent for miscellaneous short extensions to the gas and electric meters. Improvements will also be made at the power station and gas plant. The construction program for 1922 amounts in all to approximately $250,000.

Northern Ohio Traction & Light Company, Akron, Ohio, has announced that it will start at once to increase its power and light production and distribution facilities, at a cost of approximately $175,000. A three-phase primary circuit will be installed in the West Hill district, a feeder will be added to the South Akron station, and the Kent power feeder will be extended from Monroe Falls to Kent. Underground conduits are also to be installed.

Franchise

Texas Interurban Railway, Dallas, Tex., has been granted a franchise to build its line entering the city of Dallas either on Forney Avenue or on Second Avenue. The Forney Avenue route was asked by the Dallas Railway while the Second Avenue route was asked by C. W. Hobson for the interurban company. The interurban company officials asked for the route on Second Avenue with a view to using the tracks of the Dallas Railway already on that street, while the officials of the Dallas Railway wanted the interurban to build its line on Forney Avenue and then to lease its tracks to the local traction company for street car service.

New Incorporation

West End Terminal & Railway Company, Cincinnati, Ohio, was recently incorporated with a capital stock of $10,000. The incorporators are H. Lee Early, Morgan Wamsley, Louis B. Patterson, John H. Walton and Milton Sayler. Elsewhere in this issue details of the plans of the company are given.

Trade Notes

Track Specialties Company, New York, N. Y., has announced the appointment of W. B. Mallette as agent in the territory of St. Louis, Mo. He will be located at 3883 Wyoming Street, St. Louis.

Poughkeepsie Paint Company, Inc., has been reorganized with John L. Hinkley, president; Frank B. Lown, vice-president; Charles A. Brooks, treasurer, and John A. Nilan, secretary. This company will push the sale of "Filkote," which is a sanding filler well adapted to car painting.

Economy Electric Devices Company, Chicago, Ill., is furnishing a graphic form No. 341 which is used for plotting data and statistics. The sections provide for five co-related curves or groups of curves by months for five years and so separated as to facilitate comparisons and ready analysis. The sheet is letter-size and will blueprint.

Getting to the Real Source of Good Service

THE basic reason why railway managers take such keen interest in educational work is because they realize this fact: Assuming that he has good health, an employee's usefulness depends on his competency of head and hand. The first step in securing competency is to select intelligently among available prospects; the second is to train employees to do their work better.

Assuming that employees have been well selected, what next? Here is where practice differs, and where it lags behind precept. Some companies devote attention to education systematically, even going so far as to employ a director of education. Others are bewildered by the magnitude of the job and do not know where to begin. Still others are in between these extremes. There is need of a formulation of educational principles for the convenience of all railway companies, so that they may take account of stock, educationally, and lay their plans accordingly with due regard for local conditions as well as general principles which are involved.

The need for such a syllabus of the subject the committee on education of the American Association will attempt to meet this year. The committee finds that there are three fundamental requirements of a program: First, present non-technically trained employees should be under training; second, provision should be made for trade apprenticeship, and, third, co-operation with technical schools should be fostered to provide a supply of specially trained recruits. Much is being done already along these lines, but, compared with the magnitude of the electric railway industry and the urgency of the present and prospective need for more and better directive talent, the progress made so far is small.

Canadian Association Expanding Its Activities

THE program for the Quebec meeting of the Canadian Electric Railway Association, which occurs early next month, marks a forward step in the progress of this virile organization. Arrangements have been made to display in adequate fashion the exhibits of the associate members of the association, the exhibit space and furnishings for the spaces being donated. The exhibits are to occupy in many ways the place of honor at the convention, the theory of the management being apparently that nothing better can be done for the industry than to call attention to its physical achievements.

Last year the association welcomed to its Ottawa meeting representatives of the manufacturing industry, and the result was highly pleasing to the railway's representatives. In fact, it is not too much to say that they were delighted with the contributions to the discussions and to the good fellowship of the convention which were made by the erstwhile outsiders. The outsiders are such no longer, but now form an integral part of the association.

The Canadian Association has a problem which is quite distinct from that of the American Electric Railway Association, in giving unity to an industry in which there is a strong leaning toward municipal ownership and operation. Further, its constituents are distributed through a territory of magnificent distances east and west. Compared with the American Association the Canadian Association is small, and probably always will be, but the necessary limitation on its size is compensated for by intensity of interest in countrywide transportation problems.

The Bacharach Bill— Pro and Con

THE Bacharach bill now before the House judiciary committee is attracting more than passing interest from various classes of people. At the next hearing on the bill, scheduled for May 23, Mayor Thompson of Chicago will make his "appearance," following the lead of his "presidential timber" friend, Mayor Hylan of New York City, who presented his arguments on April 25.

Naturally the public utilities are interested in this bill, whose effect would be to impede them in efforts to protect their investments when threatened. The bar and the judiciary of the country are also interested because they see that it opens up some very fundamental legal and constitutional questions. The public service commissions at first favored the bill for it ostensibly strengthens their positions, but on more mature deliberation most of them probably realize that it would impede utility development. State politicians sense another "State's rights" question. And the local politicians of a utility baiting nature see in the hearings being held an opportunity to gain a little more publicity for their rantings.

A good deal of talk about this bill has been going on without there being a very clear conception of its provisions or of the arguments pro and con. What it aims to do is to remove from the jurisdiction of United States district and circuit courts all cases involving public utility rates; in other words, these courts could no longer claim jurisdiction in injunction proceedings or otherwise in rate cases or orders proceeding from public utility commissions or state courts. Such cases would be restrained from following any other course than that specified in the particular state in question. Appeal naturally could be had finally to the Supreme Court of the United States on questions of law, but this would admittedly limit the determination of all questions of fact to state courts, for appeal to the United States Supreme Court may be made on questions of law, *i.e.*, of error of procedure, only.

Digitized by Google

As regards the general purposes of the bill, those who favor it argue that rate making is a state legislative function and that the present action of Federal courts in granting injunctions against utility commission orders in rate cases defeats the purpose of all state efforts along such lines. Furthermore, that by their assumption of jurisdiction on questions of fact, they cause cases to be all gone over again, refusing to act on records made before state courts and commissions, but starting each case *de novo*, thus causing double cost to the state for the litigation.

Those who oppose the legislation have made no particular effort to present a definite case, but William Chamberlain of Cedar Rapids, Iowa, on March 28 and William L. Ranson of New York on April 25 offered some forceful arguments against the bill. Others have also appeared, but the statements of these two were particularly clear. The time which would necessarily be consumed in getting any relief from a confiscatory commission order, following the procedure of the bill, would be very great, it was argued. This would frequently be so serious that the utility would fail during the litigation. With this sort of a condition facing utilities, money for necessary development would be almost impossible to secure.

But most important are the legal and constitutional questions involved, and it was to these points that Mr. Chamberlain devoted most of his attention. The bill, it is claimed, would be unconstitutional for it would seem to prevent the operation of the "no confiscation" amendment of the Federal constitution. From the standpoint of the company, its only interest in Federal court procedure is that it knows the Federal court is there, in case of necessity, to enforce this constitutional provision upon which safety of investment rests. Proponents of the bill say that this duty of enforcing no confiscation would merely be transferred from Federal court to state court, but the opponents point out the extremes to which such a theory might lead if applied to other classes of cases.

In the testimony and cross-questioning on these particular features of the bill, a number of most interesting facts were brought out with reference to the function of the inferior Federal courts and their history from early days are traced. It was argued, on the one hand, that with the exception of the Supreme Courts they are the creatures of Congress and that Congress may define their jurisdiction; but the opposing argument shows the uselessness as well as the detriment of any such attempt. As Mr. Chamberlain says, while Congress may technically have the power to take such action, it does not have the right to do so.

It would seem that the most the Bacharach bill could do, if enacted, would be to cloud the issue and clog the machinery, for the only function of the Federal court in such cases is to prevent confiscation, and no Bacharach bill could actually nullify the constitutional provision in that regard.

Actually, the bill is based upon a fallacy. Of the total number of utility cases decided by commissions, an exceedingly small number only find their way, for any reason whatsoever, into the Federal court. This record is a commentary upon the effectiveness of commission regulation as now constituted and shows how seldom the right of appeal to Federal courts is even thought justified. The facts in the case will win in determining the recommendations of the judiciary committee and some of the best witnesses against the bill are some of the country's mayors who tell why they want it passed.

It is interesting to note in this connection the publication within the last few days by the New Jersey Utilities Association of a paper read at the November meeting of that organization by Ralph J. Baker of Harrisburg, Pa. Mr. Baker upholds in general the right of review by the Federal court and points out many of the legal limitations of state public service commissions.

National Chamber of Commerce Meets in Washington

SOME electric railway men may think that the meeting of the Chamber of Commerce of the United States at Washington this week is not of great concern to them because the general subject for consideration at the meeting was "European Conditions and Their Effect on American Business." At first sight it may be admitted that European conditions do seem to be pretty far removed from the business of local passenger transportation. Nevertheless, this is an incorrect view to take of the Washington meeting, for at least two reasons.

One of these is that the electric railway industry, perhaps more than any other, solicits patronage from every class in the community, so that it is very deeply interested in any matters which seriously affect their prosperity. This is so to such an extent that its gross receipts or their rate of increase may be considered as a gage of the average business conditions in the community which a company serves. Hence, questions like those which the National Chamber of Commerce has been discussing this week have an indirect but no less certain influence on electric railway prosperity.

A second, and perhaps more direct, bearing which the European situation has on electric railways lies in the fact that its problems are largely financial in character and so are bound to have their reflection on our own financial markets and to increase or decrease the rates which all borrowers here have to pay for money.

It is this intimate relation which electric railways have with business in general which makes it most appropriate for them to take not only an interest but an active personal part in all movements, both local and national, to improve general business conditions. This they can do probably in no more effective way than through their own local chambers of commerce, which are usually the centers of constructive business thought in their respective communities. By such participation they will not only help all lines of business, and consequently their own, but they will establish connections with the leaders in commercial thought in their own city which may be of help at a later time in their own problems.

It is only about two years ago that the National Chamber of Commerce, through one of its committees, gave a great deal of time and intelligent consideration to the problems of the electric roads. The report of this committee and the later referendum of the entire chamber helped to a clearer understanding by the public of the railway situation. This willingness of the Chamber to help in the best way possible—a study of the situation—should not and will not be forgotten by the electric railway companies in their future relations with the Chamber.

Reclaiming Old Railway Motors at a Cost that Pays

Most Motor Failures Are Traceable to Mechanical Defects—The Jigs and Tools Used and the Operations Followed in Rebuilding Old Motors on a Quantity Basis Are Described

BY WILLIAM H. HAYNES
In Charge Mechanical Operations in Shop of Kansas City (Mo.) Railways

OVERHAULING and maintenance of electric railway motors is a very serious and expensive proposition if not done properly, especially on a system that has a number of different types of motors, some of which are very old and inefficient. Where designs have been changed or where different sizes of machined fits on the frames and bearings are used and not held to standards, the problem is further complicated.

A great many of the motor failures occurring on the road can be traced back to poor standards of machine work and poor fitting of the frame parts. One common fault is the improper fitting of the armature housing into the frame. This permits the housing to become loose and to wear both the housing and frame to such an extent that the armature will vibrate. This in turn causes sparking at the commutator, loosening of the brush-holders and, most serious of all, fractures of the coil insulation which are eventually followed by burnouts. In fact, most of the failures on old railway motors are traceable to mechanical defects of some description.

The financial condition of many electric railway systems at the present time does not permit of the purchase of new motors to replace the worn-out ones. The result is that motors are continued in operation which have reached the point of service where the failures are so frequent and the maintenance is so high that the question of just what procedure should be followed becomes very difficult to answer.

On a property where a comparatively large percentage of the total motor equipment is in a worn-out condition, the ordinary makeshifts of hand machine work, shimming, etc., will not take care of the failures. With that situation existing in Kansas City, it was believed that a complete set of jigs and fixtures could be designed so that a large number of motors could be completely remachined on a quantity basis at a cost per motor that would warrant the design and manufacture of the many

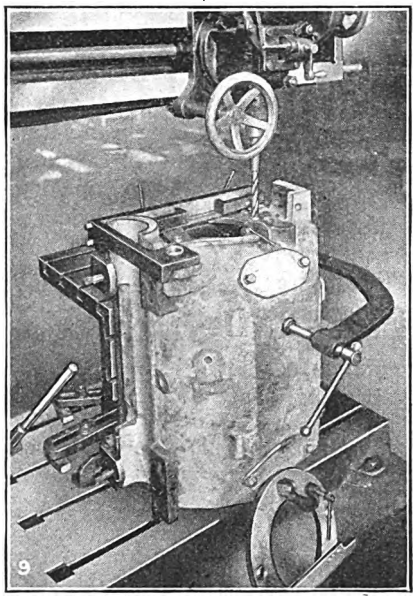
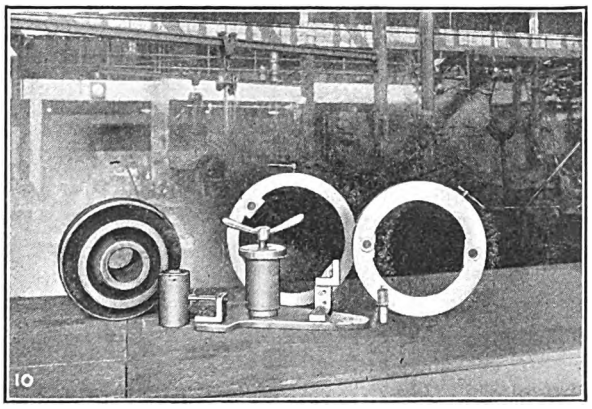
tools required in the various machining and finishing operations. In the particular instance in mind, the motors to be revamped were the G.E.-57, 67, 70 and 80 types. For the purpose of this article the writer will give the detail information as applied in the complete reclaiming and overhauling of an old type of motor, which was worked up and tested out and has proved to be in practically as good condition as when new. Of the several types worked on, the G.E.-70 motor will be used as the illustration, because it has more machine work on it than the others. At the same time it will also give an idea as to what is required in the way of jigs and fixtures for the other types. Furthermore, the G.E.-70 motor uses armature housings whereas the other types do not. The only change that was made from the original standard was in the axle bearing fit, which had to be made larger.

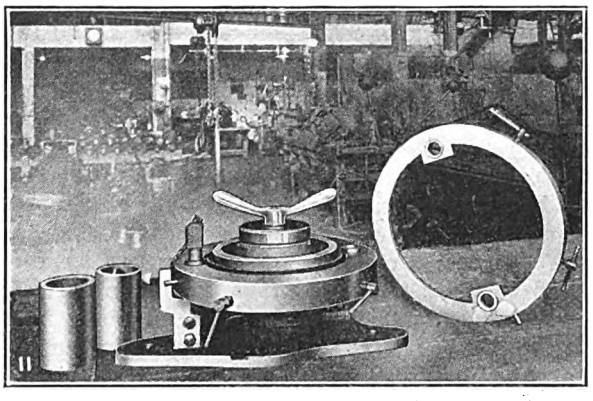
The various operations in this reclamation program were as follows: (1) Remove all fields and electric fixtures. (2) Clean frame thoroughly. We use sand blast. (3) Weld all cracks in the four housing bolt holes and other bolt holes that may be worn. (4) Plane ⅛-in. off each half of the frame. (5) Bolt the two halves together with a ¼-in. shim between them. (6) Place the frame in the fixture on a horizontal mill, bore housing fits first, pole piece seats second and axle fits third. (7) Redrill the housing bolt holes by jig, and tap out to size; also drill other bolt holes that were welded. After all burrs are filed off, case cleaned out and serial numbers stenciled on, the frame is ready to be assembled again and tested.



No. 9—Drill Jigs in Place Ready for Redrilling of Frame



No. 10—Drill Jigs and Fixture for Redrilling Bolt Holes in Armature Housing



No. 11—Armature Housing Set Up for Redrilling

Explanation of Details

In operation 3, the welding, if done by an electric welder, will prove more economical and make just as good a weld as by other methods. Care should be taken to build up the worn places that will not clean up during the machine operation, such as the support for gear cases.

In operation 4, the planing of each half to the depth of ⅛ in. trues up the field frame split, gets under all wear and brings the field frame back to a perfect fit. This is, of course, necessary, both mechanically and electrically. This planing operation allows the two halves to come close enough together to permit the reboring of the housing fits to the original standard. The gear case support on the motor case, which is usually badly worn by the gear case becoming loose, will also be brought back to normal shape. As the two halves are so different, it is necessary to have two planer fixtures to set each half up. Illustrations 1 and 2 show the two planer fixtures. Illustrations 3 and 4 show the frame halves set up in each fixture. These fixtures are so constructed as to make the set-up very quick and accurate as the half rings seen in illustrations 1 and 2 make the part self-aligning. The rings are hinged to the bed pieces to permit the frame to slide into place when making the set-up.

In operation 5, the bolting of the two halves together with a ¼-in. shim between allows the top half to clamp the armature housing tight so there is no chance for the housing to rock back and forth. This shim is removed after the machine work has been done, giving the necessary clamping effect in final assembly.

In operation 6, the complete frame is placed in the fixture on the horizontal mill. Illustration 5 shows the fixture and No. 6 shows the work set up ready for boring. This fixture is self-aligning and does not require the use of a measuring tool in the set-up, although where frames are worn very badly, it is a good plan to check all over before doing any machine work as it may be necessary first to build up a badly worn place by welding. This should, of course, be done before the machine work has been started, as the frame may warp.

This fixture also has two measuring arch bars, one on each end, which when clamped in place give the exact radius the housing fits are bored to; and by setting the boring tool up to this measuring bar, it will bore to the correct size. This is a big time saver as it does away with try fits. The lower radius of the housing fit has about twice the bearing surface as the upper part on a G.E. 70 motor. This makes it necessary to cut over half the bearing surface before one is able to measure across the diameter with a pair of calipers. Hence, using the measuring bar, which has a set size on it, does away with all waste time.

The housing fit is bored first as it is the largest and the frame is less likely to move while boring the smaller sizes. Any movement would result in bearings

Digitized by Google

not being parallel, which, of course, is essential to a smooth running motor.

In operation 7, to redrill the housing bolt holes the upper half of the frame is removed and the lower half having the bolt holes is clamped on the fixture shown in illustration 7. This is a very simple but effective fixture and makes a very accurate job. This redrilling outfit consists of one fixture and three drill jigs—one jig to drill holes for the pinion end housing, one for the commutator end housing and one for the gear-case bolt hole. Illustration 8 shows the frame clamped in place ready for drill operations and No. 9 shows the drill jigs placed ready for drilling.

In most cases it will pay to reclaim the armature housings and this has developed into a comparatively simple operation. The most important two things to consider are the outside fit of the housing and the bearing fit. The outside fit is gained by turning down and shrinking on a band, to be turned down to standard, and by using a snap gage which is the only positive way for accurate measuring in quantity production. The bearing fit can be brought back to standard by boring and brazing in a piece of seamless tubing and reboring to the standard size again. Illustration 10 shows the drill jigs and fixture for redrilling bolt holes in the armature housing. This fixture is used for both housings, which is accomplished by changing bearing fit bushings. There are two drill jigs, one for pinion end and one for commutator end. Illustration 10 shows the housing before any machine work had been done. No. 11 shows the housing placed in the fixture with the drill jig in place ready for the drilling operation.

When stamping a new serial number on the overhauled frames it is a good plan to stamp the number on all the bearing caps, and care should be taken to replace the same caps whenever taken apart, as the slightest variation in fit of bearing will cause trouble. This will happen when bearing caps are switched.

Proper Motor Testing Is Important

The testing of the motor when assembled is a very important operation as it may save a lot of lost time, due to armature or fields breaking down. Testing a motor with no load on it does not give a satisfactory test. In this shop, the motor to be tested is coupled to a generator, or another motor acting as a generator, and the generator given a load through a bank of grid resistors. This load on the motor will cause any weak parts to show up, thereby saving the time of installation of the motor on a truck, if it is in a condition that it would go down on the road.

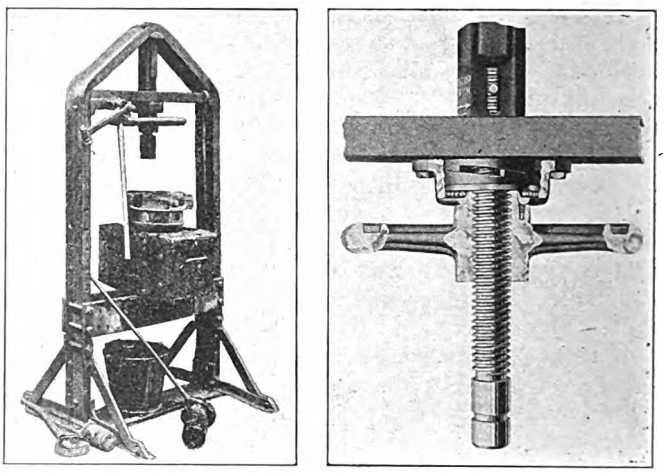
As will be readily seen from the foregoing a considerable outlay in jigs and fixtures is involved in this program, and besides the fixtures, a planer, boring mill and radial drill press are necessary. The cost per motor depends on the number handled, and a low cost cannot be obtained unless the whole proposition is handled on a quantity production basis.

With the fixtures and machine tools described and three operators on constant production, excluding the welding operation and motor assembly, two motors per day have been produced. As the motor is practically as good as new when completed and tested, the cost of the job per motor can be easily justified. From the experience already gained, it is planned to design and build like jigs and fixtures for all types of motors on this property and incorporate this work as a part of the regular maintenance. As soon as a motor frame reaches the point of wear that all parts cannot be kept securely and accurately bolted in perfect alignment, it will be removed from service and reclaimed by this scheme of operations.

Convenient Press for Forcing Bearings Out of Housings

THE accompanying illustrations show the equipment used at the Federal Street car shop of the New York State Railways in Rochester for pressing bearings out of their housings. A Weaver forcing press of 28-ton capacity is used and the housing is placed on a special wooden block 12 in. x 12 in. x 21 in. with a 6½-in. hole in the center and a ¼-in. iron top plate. This wooden block is provided with end handles for convenience in lifting.

The press used is made by the Weaver Manufacturing Company of Springfield, Ill. The frame is made of one solid piece of 5-in. 9-lb. high carbon channel steel bent to proper shape. The top is reinforced by a rigid truss brace construction, which prevents its springing under severe load. A hand wheel 15 in. in diameter with a



At Left, Forcing Press for Removing Armature Bearings; At Right, Quick Release Washers and Ball Bearings

screw 2 in. in diameter gives a range of movement of approximately 12 in. The width between frame uprights is 32 in., the height over all 72 in. and the theoretical leverage 1,500 to 1 with the lever in the lower notch and 3,000 to 1 in the upper notch. The floor space occupied is 3 ft. x 3 ft. The bolster which supports the wooden block consists of two heavy steel plates rigidly bound together by large spacing spools. Its height can be readily adjusted by inserting bolts through holes provided in the framework.

A feature of the press is the mechanism provided for quick release. This is shown in the detailed illustration. The two large cam-faced washers or truss bearings under the horizontal brace permit the pressure to be released easily by one reverse stroke of the lever. As the pressure on the screw is developed by carrying the wheel to the right these cam-faced washers tend to climb one upon the other. The angle of the cam faces is such that they will not back off, however severe the pressure may be. The reverse stroke of the lever will reverse their action, regardless of the amount of pressure upon them, releasing the pressure on the screw and permitting it to be spun up quickly by the hand wheel. The press weighs approximately 400 lb. and can be readily moved about the shop. Its construction is such that it is unnecessary to bolt it to the floor.

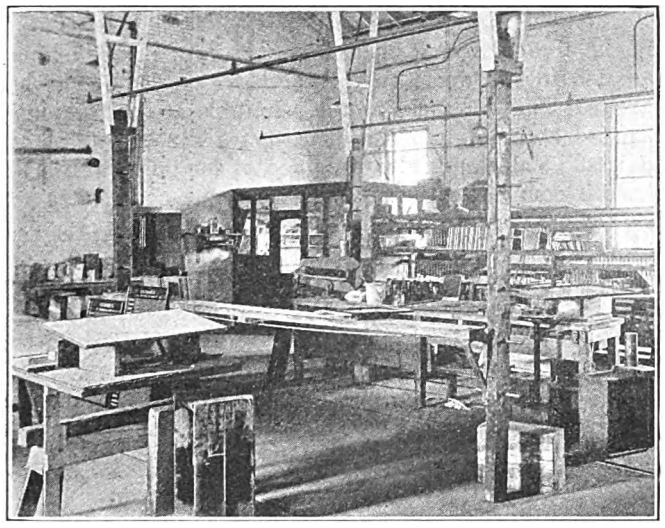
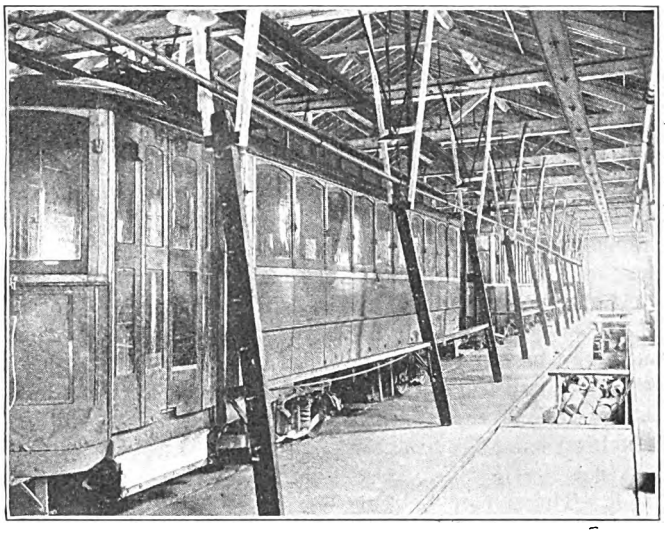
Improved Paint Shop Facilities in Rochester

Permanent Scaffolding Which Is Quickly Adjustable to Any Height, Air and Gas Piping with Convenient Outlets for Burning Off Paint from Cars and an Effective Lighting System Are Some of the Features of the New Paint Shop of the New York State Railways

CROWDED conditions at the St. Paul Street shop of the New York State Railways, in Rochester, led to the remodeling of a carhouse at the Federal Street shop for use as a paint shop. The building used is 175 ft. long x 50 ft. wide and has four tracks running the entire length of the building. This gives a capacity of sixteen cars. Excellent lighting conditions are afforded by windows along the two outside walls. As the building is a considerable distance from other adjacent shop buildings, there is no interference with the light. The two outside tracks in the shop are provided with pits, although this is not considered essential for a paint shop. These pits were in place in the building as originally used for storage of cars.



FOREMAN'S OFFICE AND SECTION OF PAINT SHOP USED FOR SIGN PAINTING



ARRANGEMENT OF SCAFFOLDING, LIGHTING AND SPRINKLER SYSTEM BETWEEN TRACKS

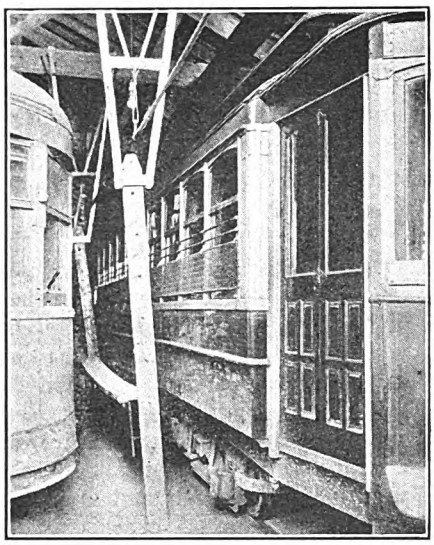
The foreman's office is located in one corner of the building and is partitioned off by the use of car doors. This makes a very attractive office and at the same time permits the foreman to see what is going on outside through the many glass windows. Immediately adjacent to the foreman's office is the sign painting and lettering department. All work of this character for the entire Rochester system is done here.

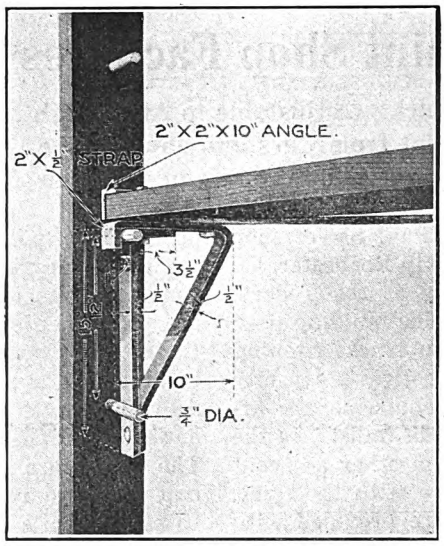
PERMANENT ADJUSTABLE SCAFFOLDING PROVIDED

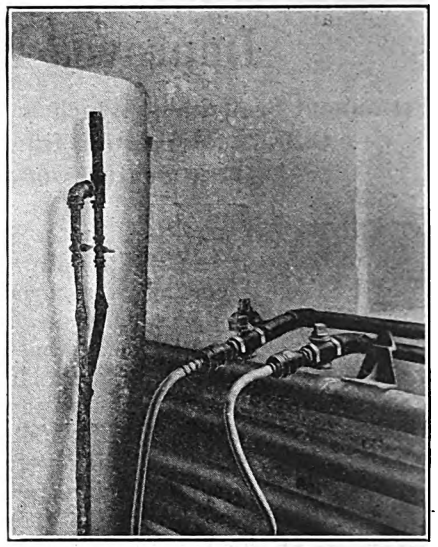
One of the most novel and at the same time convenient features of the paint shop is the arrangement of scaffolding for facilitating the painting of the sides of cars. This scaffolding, while permanent in construction, permits of both vertical and sidewise adjustments so that the staging on which the painters stand can be raised to any height as desired. The uprights which support the scaffolding are of wood 3 in. x 6 in. in section and supported at the top by saddles. The bottom end is free so that it can be moved in or out from the car body as desired. The top supporting saddles for the uprights come on a level with the tops of the windows in the cars, and a framework well braced reaches from this point to the overhead structure. For supporting the plank on which the workmen stand the upright is provided with seven projecting rods. These rods are ¾ in. in diameter and 12 in. long and project out on either side of the upright. They are spaced 12 in. apart, so that adjustments of the scaffolding can be arranged to height in even feet from 2 ft. above the floor level up to 14 ft. The top location is seldom used, however, as it is not required for ordinary car painting. The planks are 10 in. x 2 in. x 14 ft. long, and have a half inch rod running the entire length and arranged so as to form a truss for the planks. A bracket of the construction shown in one of the accompanying illustrations is bolted to each end of the plank. A top projection which has a hook fits over the top of the two rods in the uprights which serve as a support, and the lower end of the drop bracket rests against the lower rod. This provides a secure fastening and at the same time one which can be quickly changed as conditions warrant. In raising the staging the workman lifts first one end and then the other up to the next higher support. The brackets are made in two pieces of 2-in. x ½-in. wrought-iron straps. The ends of the planks are protected by 2-in. x 2-in. x 10-in. angle irons. These angles serve to give a firm foundation for the bolts which fasten the brackets and at the same time protect the ends of the planks so that they will not be split through handling. Uprights for supporting the scaffolding are arranged between adjacent tracks, and as shown in one of the accompanying illustrations the same scaffolding can be used for work on two cars at the same time.

At the end of the shop, which is provided with entrance doors, uprights are installed against the walls between adjacent doors. These come between the tracks, and the uprights are provided with rods the same as in the other parts of the shop so that the scaffolding can extend entirely to the doorway. This makes the entire length of the shop available for car-painting.

Digitized by Google







AT LEFT, A SINGLE ROW OF SCAFFOLDING PERMITS PAINTING OF CARS ON TWO SIDES. IN CENTER, BRACKET CONSTRUCTION FOR PLANKING SUPPORT OF SCAFFOLDING. AT RIGHT, HOME-MADE BLOW TORCH AND CONNECTIONS TO AIR AND GAS PIPING

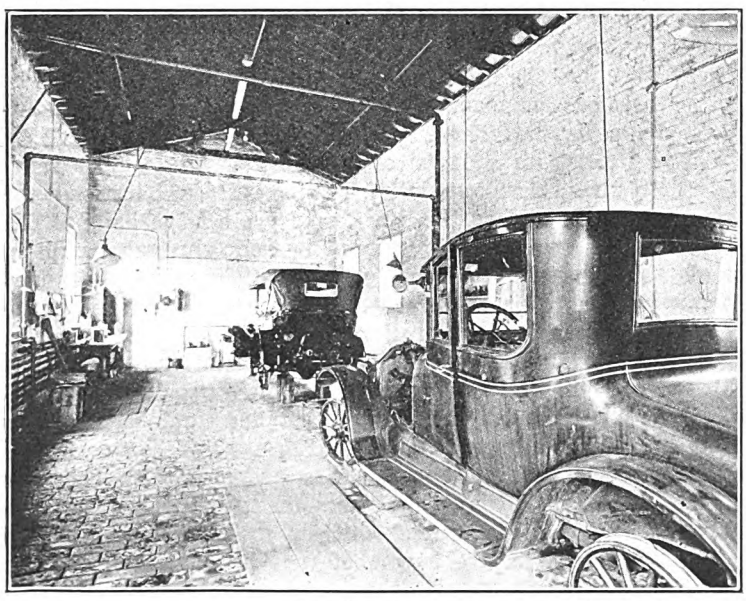
The artificial lighting for the shop is provided by sixty-five 75-watt lamps. These are arranged in five rows, one between adjacent tracks and one along each side wall. The lamp bulbs are frosted at the bottom to prevent glare and the fixtures are also provided with reflectors. In height the lights come about on a level with the car roof. This lighting system gives ample light during the darkest season of the year, so that reliable and accurate work can be done.

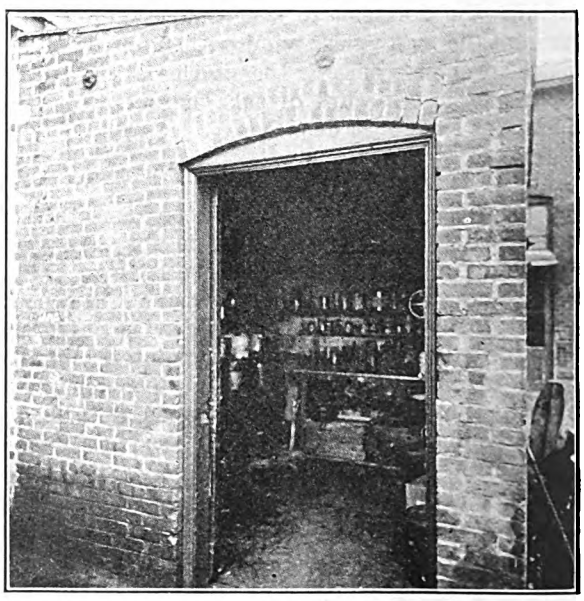
Another convenience provided in this shop is a system of air and gas piping for attachment of hose so that paint can be burned off the sides of cars. Two rows of ¾-in. pipe run the entire length of the shop on each side wall. Outlets are provided at convenient distances for attaching the hose as shown in one of the accompanying illustrations. "New Thor Perfect" hose couplings are used. These can be connected and disconnected instantly by a straight pull on the sliding sleeves. It is not necessary to twist them to remove the coupling, as the bevel jaws separate as soon as the locking shoulder moves back. The bevel jaws and locking shoulders are heavy with large bearing surfaces, which give extreme durability. A home-made torch constructed of ⅜-in. pipe is used for burning off the paint. As shown in the accompanying illustration the two lengths of hose are led to two arms on the torch which come together at *tee*. Shut-off cocks in the ⅜-in. pipe are conveniently located and regulate the quantity of air or gas as required. Valves are also provided at the point where the hose is coupled to the pipe. These have no handles and can only be turned by a wrench.

An efficient heating system is necessary in a well-constructed paint shop. The heating system in the paint shop of the New York State Railways consists of banks of steam pipes which run the entire length of the building on each of the side walls. Each bank consists of eight 2-in. pipes. The temperature of the shop is kept at about 70 deg. Fahr., as this temperature is considered best for drying and also is not uncomfortable for the workmen.

As may be seen from one of the illustrations a sprinkler system for fire protection is installed. The outlets for this sprinkler system come about on a level with the car roofs. Five lines run the entire length of the shop, one between each pair of tracks and one along the side walls.

The paints are not kept in the paint shop at night, and during working hours only the necessary quantities





AT LEFT, AUTOMOBILE PAINT SHOP. AT RIGHT, PAINT STORAGE DEPARTMENT

Digitized by Google

which are required while the painting is in progress. A paint storage building has been constructed adjacent to the paint shop which is entirely fireproof and isolated to prevent any danger from fire.

A building immediately adjacent to the paint shop is used for painting automobiles owned by the company. An interior view of this is shown in one of the accompanying illustrations. This is a well-lighted building and has steam pipes installed along the walls the same as the paint shop. The building is 20 ft. x 50 ft., and approximately thirty cars are painted here each year..

Getting Rid of Hard Spots

With Rigid Construction, Hammer Blows from Trolley Wheels Produce Hard Spots, So the Problem Is to Soften the Blows by Providing a Flexible Type of Construction

BY G. H. MCKELWAY
Engineer of Distribution Brooklyn (N. Y.) Rapid Transit Company

THE line engineer has, for many years, been trying to improve the hangers used for attaching the ears to span or catenary wires or to troughwork in an effort to eliminate what are generally spoken of as "hard spots" in the line. Under spans a partial remedy was early found in the practice of "tight trolley and slack span," in which the trolley wire was run and kept under considerable tension while the span wire was allowed to sag to quite an extent between poles.

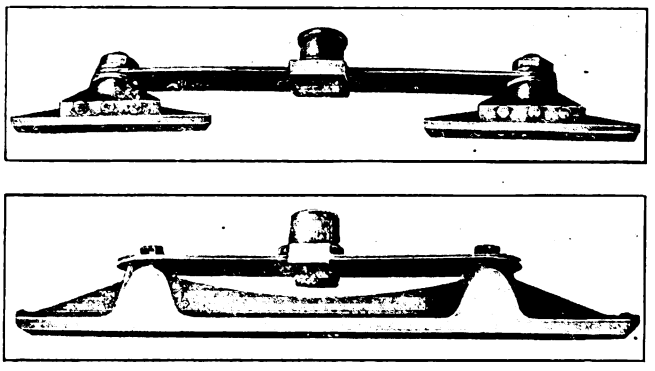
This plan worked so well that in order to prevent the hammer blows from the trolley wheel when the hanger was rigidly attached to some inflexible object, as, for instance, a bracket arm or piece of trough, the same construction has been attempted there, and except in a few cities this has become standard under mastarms, although not, as yet, looked on with favor for troughwork, on account of its high first cost and cost of maintenance. With catenary construction, not only are the blows softened by the long span of the catenary wire between fixed supports, but the hangers are, in many cases, made with long loops where they hang over the catenary, so that they can rise and fall with the trolley wire without having to lift the weight of the catenary.

Such hangers as are now used with catenary construction could not well be used under spans or bracket arms as they would move along the span or arm and cause the wire to get out of alignment, so that there has been no marked improvement in the methods used with these types since the substitution of the short piece of span wire instead of the direct attachment of the hanger to the mastarm. The use of some sort of a spring, either attached to or made a part of the hanger, is an old idea but one that has not received much attention until the last few years. More than twenty years ago attempts were made to reduce the force of the blow by means of a spiral spring contained in the hanger, which spring surrounded the stud and was compressed when the trolley wire was raised by a passing car. This type of hanger never came into general use even on lines where there were many mastarms or much troughwork, as the hangers cost more than the ordinary type in the first place and were difficult to maintain on account of failure of the springs.

The first use of a flat spring in combination with a hanger, so far as the writer has heard, was a "home-made" affair consisting of a standard round top hanger, sprung in on a span, with a thin piece of flat spring steel with a hole drilled in each end of it, fastened to the stud of the hanger by means of a nut and with a bolt through the hole in the other end, the ear being screwed on to this bolt. This construction apparently worked satisfactorily and gave no trouble so far as its maintenance was concerned. Its appearance, however, was against it and it was later discarded for that reason and not for any failure of the hanger itself.

It could not have been used so well, however, under trough as on the span. In the former location there would have had to be enough bend in the spring to prevent the wheel from touching the stud of the hanger as it passed and this bend would have suspended the wire so far below the bottom of the trough that there would have been a probability that, if the wheel should leave the wire, it would ride on the trolley and tear out the supports or damage the car equipment before the car could be stopped. The lowering of the plane of the wire would also lead to the danger of the pole fouling both the wire and the overhead structure supposed to be protected by the trough, unless the trough siding was made deeper than usual.

A few years ago the Ohio Brass Company brought



AT TOP, FLEXIBLE EXTRUDED EARS; AT BOTTOM, SPRING TYPE HANGER

out its flexible extruded ear, consisting of an ordinary hanger to which is screwed a boss, through an opening in the bottom of which is run a strip of steel spring having a short, extruded metal ear fastened to each end of it. The two short ears, each 5 in. long, and mounted with their centers 10 in. apart, act practically as a single ear 15 in. long but with its most flexible portion in the center instead of at the ends. Many of these ears have been put into service on spans as well as under trough, and satisfaction with them has been reported by users from various parts of the country.

In order to avoid the maintenance of the two short ears instead of the single longer one, which has been urged as an objection to this type of ear, an attempt was made on one system to substitute for the Ohio Brass construction a modification consisting of two mine hangers attached to the bottom board of the trough, supporting between them a flat steel spring to the center of which was attached an ordinary straight line ear. Although the stud of one of the hangers passed through a slotted opening in the spring instead of the closely fitting round hole used with the two ears, this construction was not successful and trouble was experienced due to the springs breaking. This, however, might not have occurred if the grade of spring steel had been more carefully chosen.

Digitized by Google

Quite recently the Drew Electric & Manufacturing Company brought out a spring ear using only a single ear clinched on to the wire. This ear, which is shown in one of the illustrations, has what might be called two bosses, between which is held the piece of spring steel, to the center of which is attached the single hanger which supports it. With this ear, as with the one just described, one of the holes in the strip of steel is slotted instead of being round.

The same company is producing what it calls a "cushion ear"; that is, one with the center 5 in. of the groove hollowed out to a depth of about ⅛ in. more than at the ends. It will be seen that until the wire has been driven up into the groove to a point where it is held solidly against the top of the hollowed out portion there should be no pounding on the wire directly under the hanger and but little, if any, wear upon the wire. Sections of such an ear cut open in the center, after having been up for some time, and having undergone considerable wear, showed the wire in the central portion still unworn and still protected by the lips of the ear which had been clinched around it. The lips in the center had evidently been worn away to a slight degree, but as this occurred the wire was forced further up into the vacant space in the ear above it and the rolling action of the wheel clinched more of the walls of the groove around the wire so that the latter remained still untouched by the wheel at that point.

A rather curious circumstance in connection with this cushion ear was that shortly after it had been placed on the market the writer described it to an "old timer" who had been a railway lineman for thirty years or more and was informed by him that "in the old days" he had installed just such ears, although they have not been used for many years, so many that they were now supposed to be a new development. The ears, he said, had given good service and he knew of no reason for abandoning them unless they had been superseded by something which could be manufactured more cheaply.

Copper Salts Improve Casein Glue

IT HAS been found that copper salts added to casein glues greatly increase their resistance to moisture and also make them more durable when exposed to the action of molds and fungi. Casein glues containing copper are nearly as moisture resistant as blood albumin glues.

In the preparation of copper-casein glue at the Forest Products Laboratory, Madison, Wis., 2 or 3 parts by weight of copper chloride or copper sulphate are dissolved in about 30 parts of water and are added to every 500 parts of the ordinary casein, lime and water glass glue. The copper solution is poured into the glue in a thin stream. The violet-colored lumps formed at first by the coagulation of the glue by the copper solution are reduced by stirring vigorously for about fifteen minutes, and a smooth violet-colored glue results. It is necessary to add the copper salts after the other ingredients are thoroughly mixed, in order to obtain beneficial results. Copper added to the casein before the lime and water glass is ineffective.

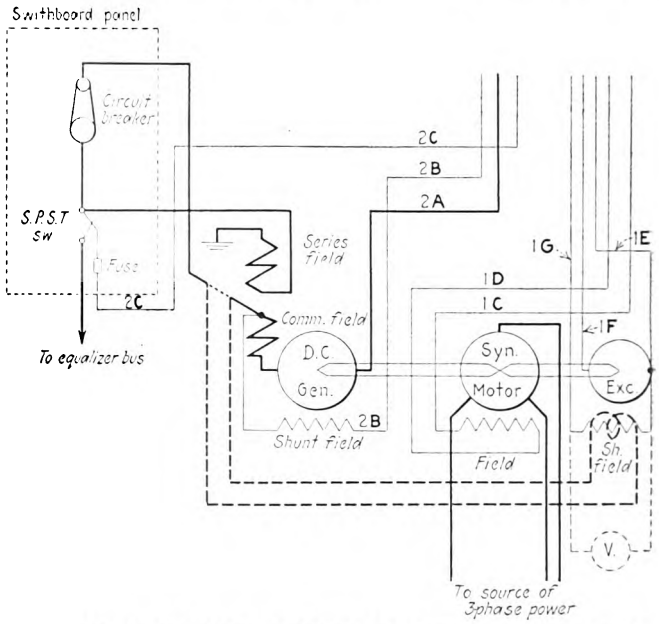
Glues containing little lime are especially improved by the addition of copper. A low-lime glue with copper may be as resistant to moisture as a glue with more lime in it, and copper does not shorten the "life" or workability of the glue as much as more lime would.

Inexpensive Compound Winding for Synchronous Motor Exciter Field

One Turn of Wire on Each of Two Poles of Exciter Field of 750-Kw. Motor-Generator Set Eliminates Regulation Difficulty in Substation of Oakland, Antioch & Eastern Railway

THE Oakland, Antioch & Eastern Railway is equipped with 750-kw. motor-generator sets, with 11,000-volt motors and 1,200-volt direct-current generators, the motors being of the self-starting synchronous type. Due to overloads on these sets as high as 200 per cent, the overloads being of widely varying character, it was found to be necessary for the operators constantly to be regulating the machine during overload periods. The difficulty was overcome by taking one turn of the negative lead of the generator around each of two poles of the exciter. These exciters are of the non-interpole type, of 18 kw. capacity, and tests showed that during the overload period it was necessary to raise the exciter pressure 40 volts.

The accompanying diagram shows how the series winding for the exciter field was cut into the generator circuit. While the arrangement shown is not altogether new, it is of interest to substation operators having difficulty with violent load fluctuations, because the work



SYNCHRONOUS MOTOR-GENERATOR SET WITH SERIES TURNS ADDED TO EXCITER FIELD

Key to Wires Reaching Beyond Bounds of Diagram:

At top of diagram, left to right—*2B* to direct-current circuit breaker through rheostat; *2A* to direct-current circuit breaker; *2C* to voltmeter; *1G* and *1F* to exciter field rheostat; *1E* to switch for connection to *1C* (which see); *1D* and *1C* through rheostat and two-pole switch to *1F* and *1E*, circuit shunted at switch with field discharge resistance.

Heavy wires at bottom of diagram go to main circuit direct or through auto-transformer, depending on supply line voltage.

was done in this case at a cost of $80 per machine, including the purchase of a voltmeter for the exciter circuit.

The motor-generator sets are now operated as follows: With no load on the generator the exciter voltage is 85 and motor operates at unity power factor. At full generator load the power factor is 90 per cent, leading current, and at 150 per cent overload the power factor is 98 per cent, lagging current. Under the last-named condition, the exciter voltage is 129.

CRANE CAR READY FOR SERVICE

Crane Cars Solve Snow-Removal Problem

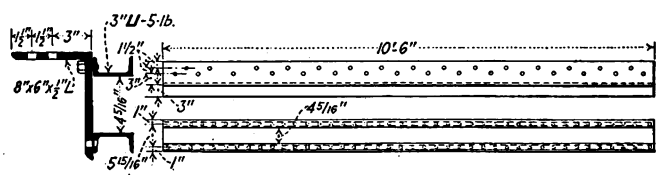
Three Crane Cars Designed by the Third Avenue Railway, New York City, for General Track Repair and Handling and Transporting of Miscellaneous Materials Have Been Used to Increase Snow-Fighting Equipment by the Addition of Wings

IN THE VICINITY of New York the principal difficulty encountered in the operation of street cars during and immediately after snowstorms has of late years been the increasing use of the street car tracks by automobiles. After the street railway company has cleaned its own tracks and before the municipality has had a chance to remove the snow from the roadways adjacent to the tracks, the street car tracks have been the only path open for the automobiles. This condition has been particularly troublesome on lines operated by underground conduit, for on these lines a stalled auto truck on the street car track prevents the operation of the conduit cleaning devices, which must be operated to keep the conduits from clogging up with snow.

On the theory that if you want a thing done the best way is to do it yourself, the Third Avenue Railway concluded that it had to clear the roadways adjacent to the car tracks, as well as the car tracks, if it did not want its lines blocked by the auto traffic using the tracks. For this purpose a steel snow wing, which would clear a path 12 ft. from the side of the car, was mounted upon one of the company's crane cars and tried out in the winter of 1920-1921. The results obtained from the trial were so satisfactory that it was decided to purchase three additional cranes and snow wings and apply them to three standard flat cars, so that there would be four cars available for this roadway cleaning service for the winter of 1921-1922. In operation it was found that this steel snow wing was able to clear the highest drifts encountered, running up as high as 6 or 7 ft., while running at speeds up to 20 m.p.h., the only limit to the speed within this range being the distance on the side of the roadway that the snow could be thrown. In running through congested streets, where the snow could only be pushed back a few feet, it was necessary to operate slowly. When running through the open country, where there was no limit to the distance the snow could be thrown, the plow could be operated at the highest speed of which the car was capable. The snow wing was made heavy enough so that it would shear off any piles of dirt or other removable obstructions encountered, though the usual care was necessary to prevent collision with fixed obstructions, such as curbs and elevated railway columns.

While the depth of the several snowfalls in the vicinity of New York during the winter of 1921-1922 was not great, the Third Avenue Railway was enabled to remove the snow from the roadways adjacent to its tracks wherever this was necessary. This, of course, does not refer to those streets on which elevated structures are located. It is the confident expectation that with this equipment the company will be able to cope with the most severe snowstorm that is likely to occur in the vicinity.

Accompanying illustrations show details of construction used for remodeling three flat cars so as to provide for the installation of cranes and also to provide necessary attachments and reinforcements for adding snow wings to be used during the winter season. As designed, these cars can be used for



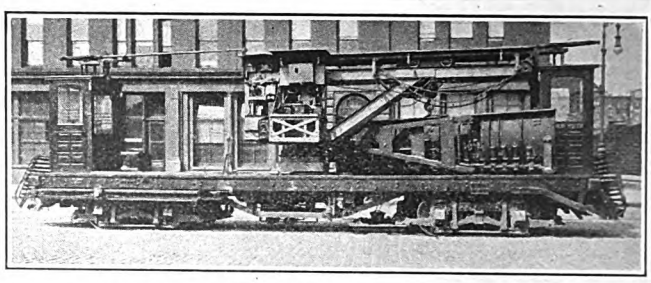
STEEL GUIDES FOR SLIDE BLOCK OF SNOW WING

general track repairs and the handling and transportation of miscellaneous railway material at all times, and during severe winter conditions when additional snow-fighting equipment is required they can be used for snow removal. The design provides for necessary attachments so that snow wings can be added and thus the snow-fighting equipment of the railway can be increased considerably.

These cars were constructed from flat cars by reinforcing the frame and body construction by the addition

Digitized by Google

of steel members, and the trucks were rebuilt so as to give a much stronger construction with heavier springs and supporting members. An operating cab was added at each end, an attachment on both sides for the addition of snow wings was incorporated and a crane equipment furnished by the Chesapeake Iron Works of Baltimore, Md., was mounted in the center of the car. These cars are 34 ft. 4 in. over bumpers and 7 ft. 7 in. wide over floor. The sides were reinforced by 5-in. x 5-in. x ⅝-in. angles and the center portion of the car was strengthened by substantial steel cross members and trusses.

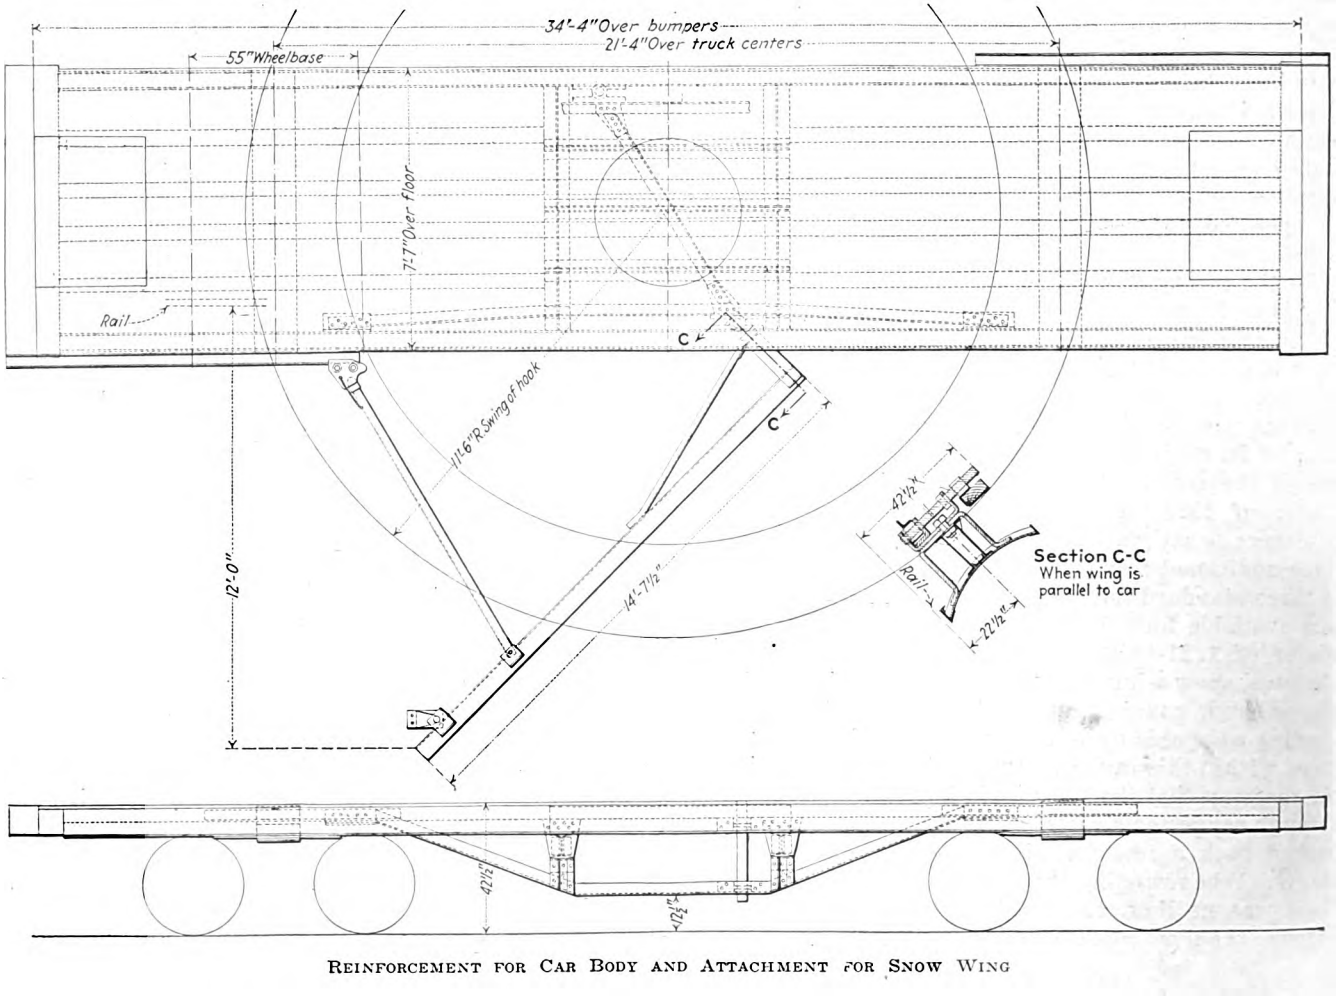


WING LOADED ON CAR FOR TRANSPORTATION

The construction and attachment of the snow wings required considerable thought, and details of this are given in the accompanying drawings. The face of the wing consists of a ⅜-in. steel plate, 14 ft. 7½ in. long. This is bent to a radius of 3 ft. ½ in. and in its finished form has a width of 40 in. The supporting framework of this wing consists of two 6-in. x 4-in. x ¾-in. angles running lengthwise at each edge with 2-in. x 2-in. x ⅜-in. angles for cross-members spaced from 14 in. to 15½ in. apart. A further strengthening channel support is provided which runs from the center of the wing back at an angle to the supporting end. This extends back a distance of 16½ in. from the back side of the wing, and gives a firm supporting base for attaching to the car framework. A detail of the brace for this snow wing is also given, together with the steel guide which has been added to the side of the car for supporting this. As at present arranged, this wing can slide along the side of the car for a distance of approximately 10 ft., and the wing will fold in alongside the car to clear any obstructions which may be encountered. The slide block at the supporting end of the brace can be moved along the side of the car by means of an endless chain which passes around the drum of an ordinary hand brake staff.

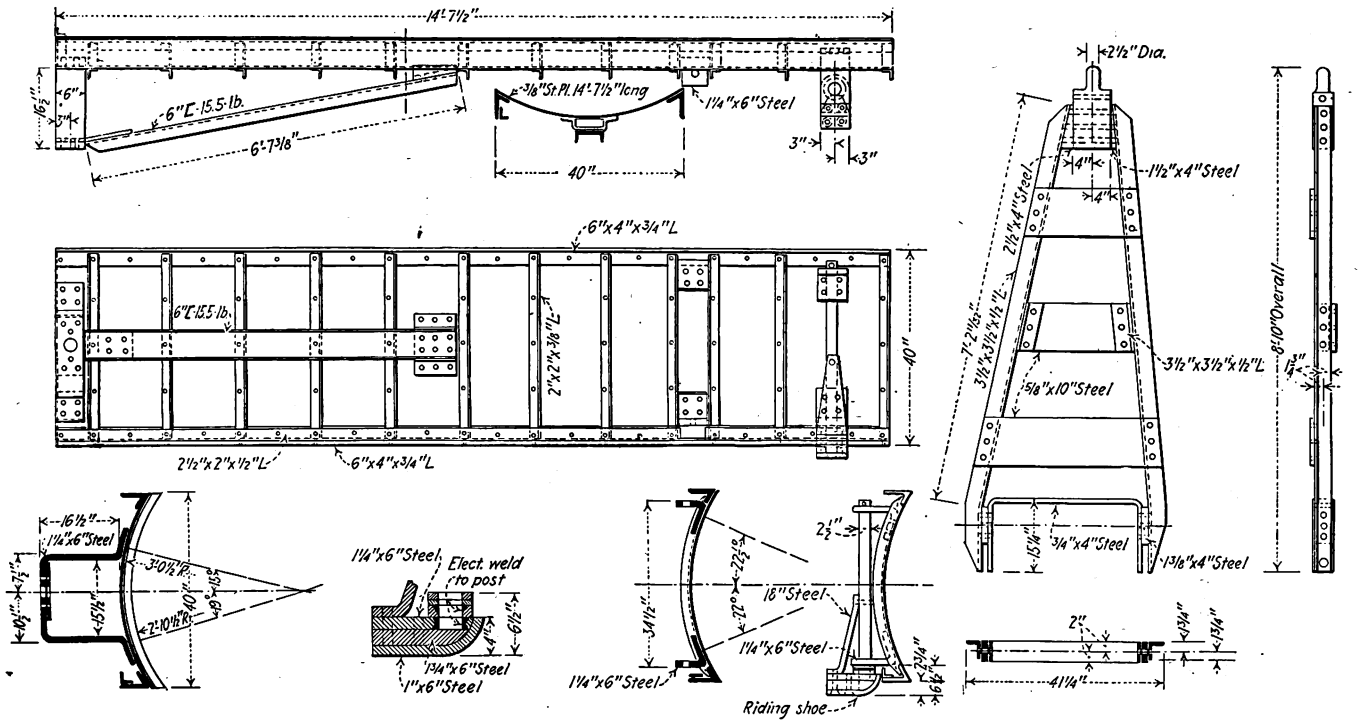
The outside end of the snow wing is provided with a riding shoe. This is made up of steel plates and keeps the bottom edge of the wing a distance of 2¾ in. above the pavement. The construction of this riding shoe is shown in the accompanying details. In the accompanying illustrations the lower edge of the wing is shown with attachments which can be forced back should they strike an obstruction. Springs are provided on the back of the wing to keep these in position. This type of construction was used on but one wing. The others have wooden projections which will be knocked off if a sufficient obstruction is encountered. The idea of this arrangement is to provide a construction that will give way instead of transmitting strains that might injure the wing.

The crane mounted in the center of the car provides for the handling of the snow wing in an efficient manner. The current for operating the crane is obtained



REINFORCEMENT FOR CAR BODY AND ATTACHMENT FOR SNOW WING

Digitized by Google

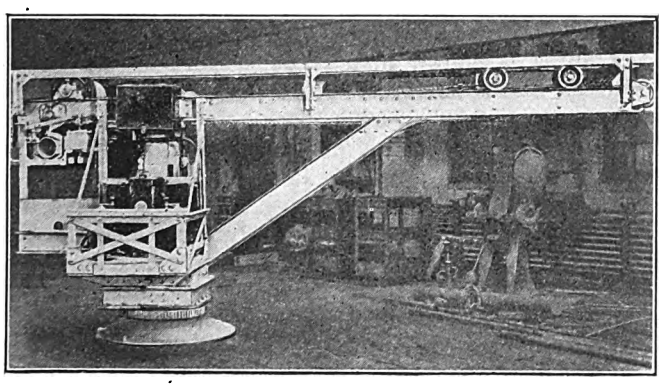


DETAILS OF SNOW WING, SHOE AND BRACE

from the regular contact system of the railway, which is used to operate the car. The crane motors are designed for a range in voltage from 360 to 650 volts. The low value was considered advisable to provide for emergencies during stormy weather where an exceedingly large drop in voltage might be experienced. The crane has the three movements, hoisting, trolley and revolving; each movement being operated by a separate motor and controller. The controllers are conveniently located in the operator's cage which is attached to and revolves with the crane frame. General Electric Company's motors are used. A 10-hp. motor is used for the hoist and two 3½-hp. motors for the trolley travel and for rotating the crane. The speeds provided for the crane under full load are hoist 26 ft. per minute, trolley travel 50 ft. per minute, and rotating two revolutions per minute. The hoisting motor is provided with full magnetic and dynamic braking. The revolving frame is supported and revolves on a stationary steel casting column which is held down to the special framing in the car body and is designed to perform all functions with a load of 3 tons supported at a radius of 11 ft. 6 in. from the center of the steel casting column.

One of the principal features of this equipment is the clearance in which the crane operates. The height from the top of the track rails to the top of the crane is but 11 ft. 9 in. and an effective hook travel of 9 ft. is obtained. The distance from the center of the column to the extreme rear end and to the extreme side of the operator's cage is but 4 ft., giving clear track space for passing cars. The extreme radius of the boom is 14 ft. and the effective radius of the hook is 11 ft. 6 in. The column base occupies a space of 4 ft. in diameter, and the clear height is 2 ft., which is available above the car floor alongside the column.

In addition to providing a very efficient piece of snow-fighting equipment, these crane cars have exceptional value for handling and transporting all classes of heavy railway material, such as poles, motors, controllers, car trucks, rails, etc.



GENERAL VIEW OF CRANE USED

Safeguarding Gasoline from Stray Railway Currents

THE National Fire Protection Association has recently given some attention to the prevention of fires in gasoline tank cars caused by electric sparks. The association states that this danger may be guarded against by insulation of spur tracks from main tracks carrying electric current, or by suitable grounding and interconnection, permanent or temporary, of rails, cars and oil-handling pipes and equipment.

The following rules were prepared by the association to cover this case:

1. On all side-track installations, where tank car shipments of gasoline or similar products are to be handled, and where there is danger from stray electric currents, an electrical connection must be made between the car or track and loading or unloading pipes before the loading or unloading operation is begun. This may be provided for temporarily by a portable conductor attached to the metal tank band of the car or permanently by protected cable or strong wire securely attached to the nearest rail on which the car stands.

2. All oil-siding rails must be insulated from other tracks when such sidings have a direct connection to tracks equipped with an electrical signal system or used by electric locomotives.

3. Such bonding connections must be frequently inspected to insure that they are in serviceable condition.

Equipment and Its Maintenance

Short Descriptions and Details of New Apparatus of Interest to the Industry. Mechanical and Electrical Practices of All Departments

Using Bitulithic Waste as Ballast

The Hutchinson (Kan.) Interurban Railway Took the Contract for Removing Old Pavement and Used It for Ballast in Reconstructing the Track Bed

WHEN the city of Hutchinson, Kan., called for bids on the work of removing a layer of bitulithic pavement from the surface of one of its streets which was to be repaved with brick the Hutchinson Interurban Railway, which has a track along this street, entered the competition, secured the contract for the work, and also was given the privilege of using the material taken up as ballast for the track bed. In most cases where the bitulithic material is taken up after it has been worn out on the street it is purely waste material, but it proved excellent ballast and of great value to the electric railway company. The bitulithic material is composed of 97 per cent crushed rock and 7 per cent coal tar.

This work was done on Avenue A East, from Main Street to Pershing, a distance of eight blocks or 4,592 lineal feet. The street is 24 ft. from curb to rail, the track being in the middle of the pavement. The material was first pried loose from the concrete base by means of bars, broken by sledges, and run through a crusher which reduced it to particles of about 1 or 1½ in. in diameter. The crusher was a machine of the oscillatory type, mounted on a low-wheeled truck with a Westinghouse 323-A railway motor. The crusher itself was borrowed from the Carey salt plant, where it is used to crush defective salt blocks.

The power to run the crushing apparatus was taken direct from the trolley wire by means of a wire run up along a light pole. The whole apparatus was moved whenever it was desired to allow a car to pass.

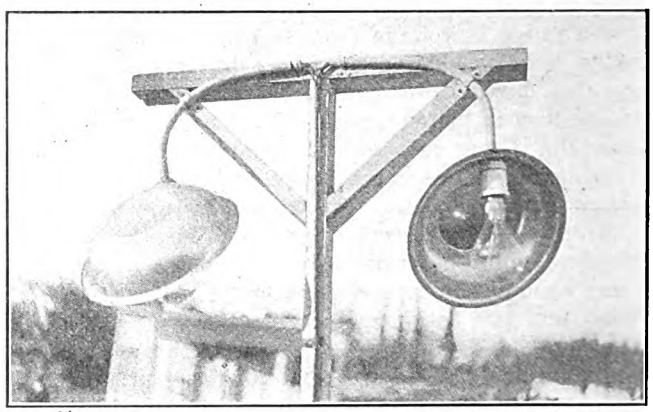
A large part of the work was done at night, because the heat in the daytime caused the material to run together, impeding the crushing. It crushed best at a temperature of 40 deg. Fahr. or below. During the day a stream of cold water was kept playing on the pavement, to keep it as brittle as possible. During the night light was provided by clusters of five lights each, mounted on tall standards, and drawing electricity direct from the trolley wire. Reflectors behind these clusters concentrated the light. By this method the work proceeded as well at night as during the daylight.

The street produced about 1½ yd. of ballast on the track for each lineal foot. The crushed material remaining is now being stored for future use. The company maintained a full crew and crushed about 3½ to 5 yd. an hour.

The roadbed was prepared by excavating to a depth of 5 in. below the ties, giving about 14 in. of ballast to the ball of the rail. All ties used were treated with carbolineum. The ballast was thrown in after being crushed and tamped thoroughly until there was no movement of the rail. On top of the bitulithic ballast a 2-in. mat of rock asphalt was laid, bringing the top of the ballast and mat to about ¾ in. below the top of the rails. The track is of standard width and the ballast was put in for a width of about 12 in. on the outside of the rails.

Emergency Lighting Equipment for Track Rehabilitation

THE accompanying illustration shows a lighting stand of cheap construction used by the Toronto Transportation Commission for lighting track construction work. The reflectors consist of two tin basins with holes punched through one side for bringing through the



LIGHTING STANDARD FOR TRACK RECONSTRUCTION

leads to the lamp. Two of these units mounted on a wooden framework form a lighting unit, and the reflectors, when placed as shown above, provide a good distribution of light. The fixture is rugged and if one is knocked over during construction and damaged the loss is of small consequence.

Timber Preservation Grows in Importance

THE increased demand for permanent timber structures is shown in a recent report of the Service Bureau of the American Wood Preservers' Association. More than 2,400,000,000 board feet of timber for various purposes was pressure treated in 1921 by the 122 wood preserving plants in operation throughout the United States, thereby surpassing the 1920 record by nearly 17 per cent. Approximately equal amounts were treated with coal-tar creosote and with zinc chloride, the standard wood preservatives.

To treat this wood 51,375,360 lb. of zinc chloride, with an absorption of ½ lb. per cubic foot, and 79,384,326 gallons of creosote, with an absorption of 5 to more than 20 lb. per cubic foot, were required.

A Practical Example in Track Replacement

Some Actual Calculations and Results Are Given Which Were Encountered in Replacing a Lorain Spiral Turnout with an A.E.R.A. Switch Easement

BY SAMUEL STRIEZHEFF
Way and Structures Department,
Brooklyn (N. Y.) Rapid Transit Company

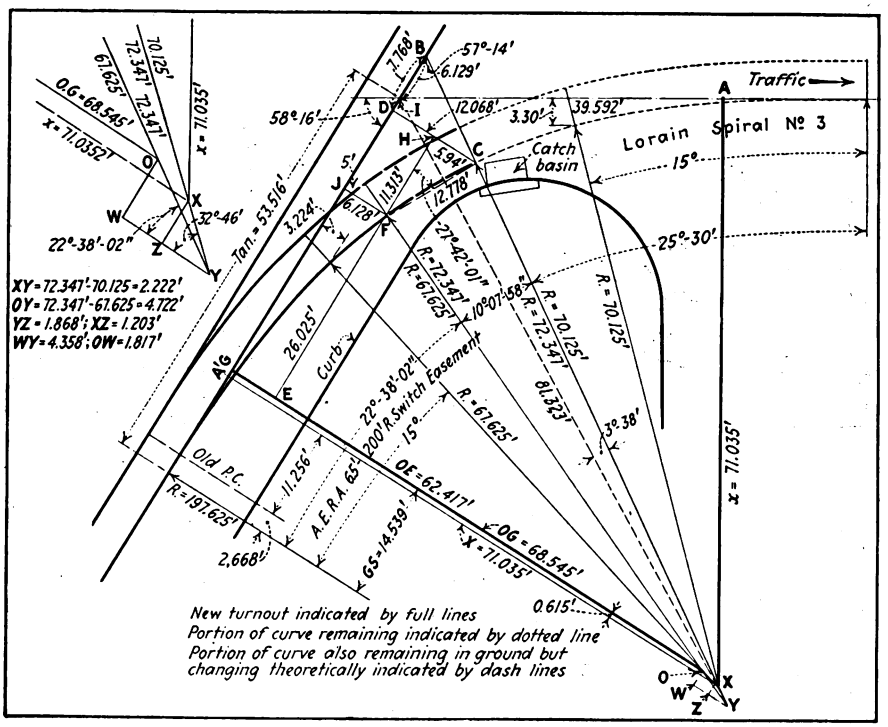
ON A RECENT job the problem of replacing the turnout portion of a curve containing a Lorain switch spiral with one having an A.E.R.A. switch easement presented several practical considerations. In this case it was desired to disturb as little of the remaining portion of the curve as possible. As the track passed very close to a sewer catch basin, as shown in the accompanying diagram, an approximate point *C* was tentatively established, just beyond the sewer basin, and the angle of the arc of the dotted portion was found, by scaling, to be 25 deg. 30 min. It was then necessary to select the proper A.E.R.A. easement and the immediately abutting radius for the new turnout so as finally to connect the dotted portion with this turnout by means of curve *FC* of the intervening radius. It was advisable to keep as near to the old radius as possible so as to eliminate the replacing and rebending of this *FC* portion.

A study of both A.E.R.A. easement and Lorain spiral tables revealed the fact that 15 deg. of the 6.5 ft.—200-ft. radius A.E.R.A. switch easement *A* terminates with an *X* offset to tangent equal to 3.224 ft., while a similar 15 deg. arc of Lorain switch spiral No. 3 has an offset of 3.30 ft., thus creating a practically similar condition for the plain curve abutting either on the easement or the spiral. It was then evident, without any preliminary calculations, that it would be best to select such a radius for the plain curve portion of the turnout itself as would closely approach the radius of the old spiral No. 3 turnout. A value of $R = 67.625$ ft. was picked out as one of the "recommended practices" given in the A. E. R. A. table. That much done, it was necessary to calculate the mathematical properties of the new turnout and of the dotted portion which remained unchanged, so as to locate their respective terminating points, *F* and *C*, for these latter would then be the ends of isosceles triangle *FYC*, the vertex angle of which would equal the arc of dash-line portion of curve of as yet unknown radius.

The Lorain spiral tables give the requisite $x = 71.035$ ft. and with half of the intersecting tangent angle of 58 deg. 16 min. the hypothenuse *XI* of right triangle *AXI* is found to be equal to 81.323 ft. By extending the radius line *XC* to the point *B* on the intersecting tangent the triangle *BXI* is obtained. Of this the side *XI* is known. All three angles are also known because the angle at *X* equals the difference between half of the intersection angle and the angle *AXC* of the portion remaining in the ground, while the angle at *I* equals the angle of intersection (58 deg. 16 min.) plus half its supplement. Then the angle *B* is easily found. It is opposite the known side *XI*. We, therefore, obtain *BI* equal to 6.129 ft. and *BX* equal to 84.477 ft.

Now by subtracting the radius *XC* of the dotted curve we obtain *BC* equal to 14.352 ft. Considering this as the hypothenuse of the triangle *BCD* with angles known, we find *DB* equal to 7.768 ft. and *DC* equal to 12.068 ft.

We have thus located the point *C*, which is the termination of the dotted remaining portion, with relation to the point of intersection of tangents and to the tangent at the end of easement *A*. Now taking up the A.E.R.A. easement which is to replace the old Lorain spiral turnout up to the end of the 5-ft. frog arm, we find that amount of arch that will include the frog arm



TURNOUT AS RECONSTRUCTED

equal to 22 deg. 38 min. 02 sec. terminating at point *F*. This portion is still unattached, as it were, and our duty now is to join it to the remaining portion through the medium of the unknown *FC* portion. With the radius *OF* of the easement known and used as the hypothenuse of the triangle *FOE*, of which the angle at *O* equals the arc of the entire turnout (22 deg. 38 min. 02 sec.) we find *EF* equal to 26.025 ft. (which we shall use later to obtain our tangent distance) and *OE* equal to 62.417 ft., which subtracted from the *OG* given in the tables leaves $EG = FJ = 6.128$ ft., this being the tangent offset of the terminating point *F* of our new turnout. Now we have to find the radius of the connecting portion *FC* and also locate definitely the point of tangency of the easement relative to the point of intersection of tangents, the Lorain spiral tangent naturally remaining unchanged.

If we project the values for *JF* on *DC* just found and subtract it from the latter we obtain *HC* equal to 5.94 ft., which we consider as one side of the right triangle *HFC*. The angle at *F* is equal to the angle of the entire easement *A*, plus half of the vertex angle of the isosceles triangle *FYC*, which in turn equals the

Digitized by Google

difference between the angle of the intersecting tangents and the sum of the arcs of the dotted line and full line portions, namely, 58 deg. 16 min. — (25 deg. 30 min. + 22 deg. 38 min. 02 sec.) = 10 deg. 07 min. 58 sec., this being the arc connecting the dash-line portion. Half of this equals 5 deg. 03 min. 59 sec. and added to 22 deg. 38 min. 02 sec. gives the angle at *F* equal to 27 deg. 42 min. 01 sec.; with *HC* known. We then find *FH* equal to 11.313 ft. and *FC* = 12.778 ft., this being the base of the isosceles triangle *FYC*. We now find *YF* = *YC* = 72.347 ft., which is the radius of dash-line portion of curve.

The only thing remaining is to find the new tangent distance. By simply adding *GS* (as per table), *EF*, *FH* and *DI* we find the tangent equal to 53.516 ft.

The interesting feature about the dash-line portion *FC* is that as the radius is so close to the old replaced radius, there is no necessity for taking the old rails of that portion out of ground and replacing them with others of a new radius. It is necessary only to force the ends of old rails at *F*, ⅜ in. toward the tangent to meet the new turnout. It is also interesting to point out the simplicity of checking the foregoing calculations. Checking is, of course, necessary.

It is evident from the diagram that the point *X* (which is the center of the original plain curve abutting Lorain spiral on each end) remains in the ground in the same theoretical location and that *O* becomes fixed relative thereto, so that all we need to prove is that *WZ* equals the difference between the Lorain spiral *X* distance 71.035 ft. and the A.E.R.A. easement *OG* distance 68.545 ft., both being projected from the same tangent. Study of the sub-diagram at the left in the illustration will show that in the triangle *XYZ* we know *XY* and the angle at *Y*, therefore we easily find *YZ* = 1.868 ft. and *XZ* = 1.203 ft.

The same sub-diagram also shows us that in right triangle *OYW*, we know *OY* and the angle at *Y*, and so we find *WY* = 4.358 ft. and *OW* = 1.817 ft. Now subtracting *YZ* from *WY* we get *WZ* = 4.358 ft. — 1.868 ft. = 2.49 ft., which is exactly equal to 71.035 ft. — 68.545 ft. = 2.49 ft.

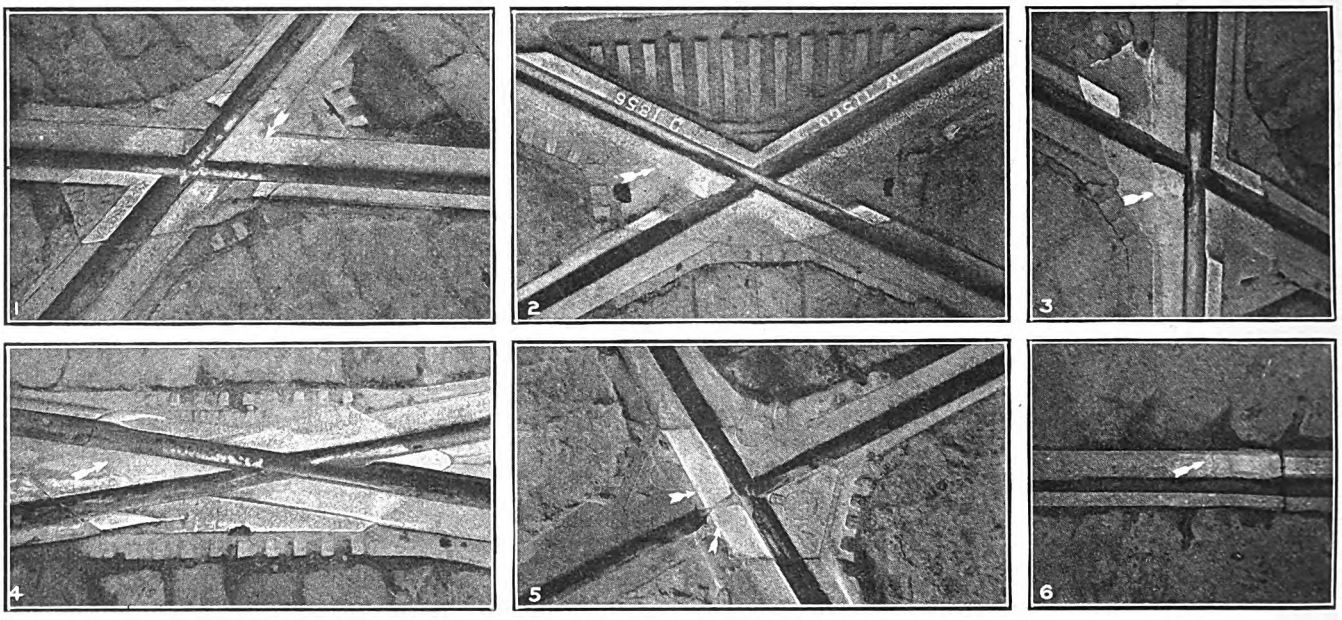
We can also prove our tangent distance by subtracting *XZ* from *OW* and obtaining 0.615 ft. We then subtract this from *A'I*, which is equal to *AI* on the other tangent, and get 39.592 ft. — 0.615 ft. = 38.977 ft., and adding to this *GS* we get 38.977 ft. + 14.539 ft., = 53.516 ft., the new tangent.

Manganese Centers

Manganese Welding of Special Work in Syracuse Shows that Successful Results May Be Obtained if Repairs Are Made with Particular Care and Before Trackwork Is Badly Battered

BY H. E. BEAN
Engineer Way and Structures,
New York State Railways, Syracuse, N. Y.

DURING the summer of 1921 some welds were made on manganese special trackwork at the intersection of South Warren and East Genesee Streets in Syracuse. The accompanying illustrations show the condition of this trackwork after nearly nine months service. There are no appreciable depressions on these frog points and the results secured so far have been very satisfactory.



FIGS. 1, 2, 3 AND 4—WELDED SPECIAL TRACKWORK AT THE INTERSECTION OF SOUTH WARREN AND EAST GENESEE STREETS, SYRACUSE
FIG. 5—THROUGH-RUNNING RAIL WITH JUMP FROG ON UNUSED TRACK AT SOUTH SALINA AND WATER STREETS, SYRACUSE
FIG. 6—ORDINARY WELDING OF STRAIGHT RAIL

Referring to the illustrations, the welds on the castings shown in Figs. 1, 2 and 3 were made about Aug. 1, 1921. The welding in each case began near the point indicated by the arrow. The wear since the welds were made is about what would be expected from new castings, there being a slight tendency of the metal to flow, but no apparent brittleness, cracking or spalling off.

The weld on the casting shown in Fig. 4 was made Feb. 20, 1922. This weld was made necessary by the breaking out of the entire frog point back to the point of the arrow. All of the frogs shown in Figs. 1, 2, 3 and 4 are located at the intersections of South Warren and East Genesee Streets in Syracuse.

The weld on the hard center in Fig. 5 was made to give a through-running rail on the main line track with a jump frog condition on the cross track. This crossing is at South Salina and Water Streets in Syracuse, and the filling in was made possible by the fact that the cross tracks are seldom used and then only for the

Digitized by Google

storage of an occasional car which has become disabled in service. Fig. 6 shows a weld made on straight rail and indicates the result of ordinary track welding. In this case the weld was made at a coupled joint and, while the picture does not show it, the surface of the rail across this joint is in perfect condition.

The car movements over the frogs shown in Figs. 1, 2, 3 and 4 are about 391 daily, or for eight and one-half months since August 1 there have been approximately 99,800 car movements. The car operations over the frog of the casting shown in Fig. 5 have been at a rate of about 415 daily or a total of approximately 105,000 since the weld was made. It will be noticed from the illustration that the flanges of the wheels have made some depression in the welded metal, but there is still sufficient running surface on the rail head aside from the flange bearing, which in some instances is built up and ground.

METHOD OF MAKING THE WELD

In regard to the method of carrying out the work and of applying these welds to the special trackwork a very important factor is cleanliness of the parent metal. In this work we are now using a dilute solution of nitric acid. This acid has been cut with zinc to avoid the ill effects on the hands of the operators. The fumes from this acid, caused by welding, are disagreeable, and we are now experimenting with a neutralizing alkali in an effort to eliminate this objection. This, of course, is done after the acid has cleaned the metal to the desired extent. Wire brushing is also used to eliminate the scale or deposit of other foreign matter on the work.

The electrode used for depositing the metal is about a 15 per cent manganese coated electrode of ¼ in. diameter. This is applied by means of a resistance outfit, special care being taken to insure that the proper amount of current is used. This is generally less than is used on straight work by approximately 50 amp.

Frequent quenching of the weld by means of water applied directly or with a wet mop appears to have a toughening effect on the deposited metal. The method of applying the layers of material is varied according to the shape of the weld and the judgment of the welder. On welds which are nearly square a criss-crossing of one layer upon another is generally used.

Care should be taken particularly to maintain a short arc, thereby allowing the molten metal to pass from the electrode to the work with a minimum of contact with the air. This reduces the oxidation to a minimum. A long arc has a much greater tendency to sputter and to move from one side of the electrode to the other, while the short arc has a much greater tendency to remain globular in form and to accomplish the required result. The retention of manganese in the deposited metal can be determined approximately by the comparative color of the two metals after grinding. Where the results are good it will be found almost impossible to observe the line of demarcation. Grinding is important, of course, in order to secure as smooth operation as possible. It is of course impossible to secure satisfactory results from welding frogs that are so badly battered that there is insufficient foundation upon which to start. When there is a notable depression due to battering, welding will prevent excessive pounding and will be less costly as well as giving better results if done immediately rather than if put off until loosening of the hard center or other failures occur.

Determining Penetration of Wood Preservatives

THE effectiveness of any wood preservation treatment is measured very largely by the depth to which the preservative penetrates. This can be determined by the following tests, which are used by the U. S. Forest Products Laboratory, Madison, Wis.

The presence of creosote oil is indicated by the dark discoloration, and the degree of penetration may readily be determined by taking a sample at a point free from checks and other imperfections and at a considerable distance from the end. This may be done either with an ordinary ½-in. bit, or with an increment borer, which brings out a core of wood that shows in cross-section the depth of penetration and is easily examined. The observation should be made at once, because the oil spreads rapidly over the cut surface. In order to prevent infection, the hole in the treated piece should be tightly closed with a creosoted plug.

As zinc chloride is colorless, the depth of penetration of this preservative must be ascertained by chemical means. After cutting the stick in two or getting a sample with the increment borer, the freshly cut surface is dipped for not to exceed ten seconds in a 1 per cent solution of potassium ferrocyanide, and the excess solution is removed by blotting paper. The sample is then dipped into a 1 per cent solution of uranium acetate, and dried. The treated portions will be whiter than the natural wood, and those untreated will have a dark red or a maroon color. This method does not give very sharp contrasts on wood which is reddish in color, like red oak, but otherwise is very satisfactory and affords a permanent record.

Another method (developed by Galen Wood) consists in spraying over the freshly cut surface a mixture of equal parts of a 1 per cent potassium ferrocyanide solution, a 1 per cent potassium iodide solution and a 5 per cent solution of soluble starch. This colors the treated portion a very dark blue, but does not affect the untreated wood. Although the color fades in time, it may be brought back by spraying again.

Sodium fluoride is colorless, and no satisfactory method of showing its presence in wood has been devised.

Mercuric chloride is also colorless, but dipping the wood in a solution of hydrogen sulphide turns the treated area black.

As individual pieces may show an abnormally high or low degree of penetration, sufficient number of tests should be made to obtain a fair average. Samples should be taken at a considerable distance from the ends of the stick, in order that they will not be affected by the heavy longitudinal penetration from the ends.

Tighten Commutators Under Pressure While Hot

A TYPOGRAPHICAL error occurred in the article by John S. Dean on "Revamping Old Railway Motors," which was published in the April 15 issue of ELECTRIC RAILWAY JOURNAL. The original manuscript read: "Care should be taken to tighten the commutator while hot and under pressure." As published the word "hot" appeared as "not," so that the sentence read "tighten commutator while not under pressure." The Westinghouse Electric & Manufacturing Company has advised that it strongly advocates the tightening of

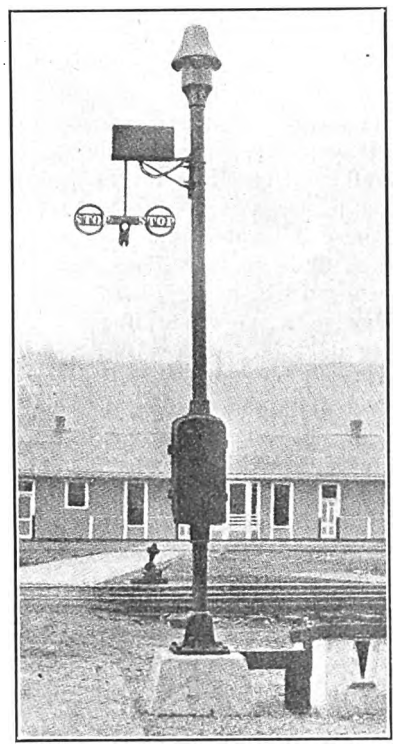
Digitized by Google

commutators while they are hot and at the same time while they are under pressure, as experience has shown that more satisfactory results are obtained if this method is followed.

What's New from the Manufacturers

Safety Crossing Signal

THE accompanying illustration shows an installation of the Adler safety crossing signal. It consists of two disks mounted on opposite sides of a vertical shaft and suspended above the highway. Normally when the crossing is clear the disks are held with their edges to the highway by an energized magnet. On the approach of a train the magnet is de-energized and the vertical shaft revolves through an angle of 90 deg. by gravity and the disks face the highway. Supplemental to the disks are hooded red lamps which flash on the approach of a train. These lamps flash about sixty times a minute and, due to the fact that the filaments have no time to cool off, there is always a glow in the lamp during the interval between flashes. The period of illumination is considerably longer than the period of semi-darkness. The design of the banner is similar to the traffic semaphores used by police departments in most large cities.



CROSSING EQUIPPED WITH SAFETY CROSSING SIGNAL

The mechanism consists of a crank which is connected to the upper end of the vertical shaft, on one side of which is connected a solenoid and magnet and on the other side a counterbalancing adjustable weight. The solenoid upon being energized turns the shaft so as to clear the signal, and the signal when clear is held in that position by a high resistance magnet, which when de-energized allows the signal to turn to "stop" by action of the counterweight. Thus in case of failure the signal will assume its "danger" position.

The operation is as follows: The flashing light operating on an open circuit is connected to its electrical source through the back contact of a track relay. The solenoid and magnet controlling the banner, which operate on a closed circuit so as to display the warning by gravity, is connected to the same electrical source through the front contact of the track relay. An approaching train, de-energizing the relay, will cause the banner to be displayed by cutting off the current from the holding magnet, and at the same time the flashing light will be displayed by making a connection from the electrical source to the lamps through the back contact of the relay. In addition to this method of operation, the signal can also be controlled by trolley contactors or by track instruments. Ball bearings are used throughout and all working parts are inclosed.

Venting Protection for Renewable Fuses

RELIABILITY in renewable fuse construction has been sought through the development of a fuse with the Shurvent construction by engineers of the Westinghouse Electric & Manufacturing Company. This construction acts on the principle of baffles and retards the flow of gas sufficiently to maintain enough pressure within the cartridge to extinguish the arc, and it also allows the gases to leave the fuse only after they have been cooled to a temperature that eliminates hazard of fire or of personal injury.

Shurvent fuses have a series of fixed washers at each end of the casing. These washers are channeled to form air chambers and they are connected to the inside of the casing, to each other and to the outer air by staggered openings. The hot gases follow these courses more readily than along the threads, but they will be retarded sufficiently to accomplish two purposes—effective quenching of the arc in the casing, without damage to the casing itself, and cooling of the gases so that they will leave the fuse at a safe temperature.

In the knife-blade type the links are solidly bolted to the copper terminals. In the ferrule type fuse the only parts to be removed for renewal are a cap and a washer from each end, while only one ferrule and the loosening of the screws at the other end are necessary in the renewal of the knife-blade type. These screws are permanently fastened to the end washers so that they cannot be dropped and lost.

New Air Gun for Maintenance Work

A NEW brass air gun has recently been placed on the market by Jenkins Brothers, New York, manufacturers of valves. Special attention has been given in the construction details to prevent air leakage. A renewable disk with which the air gun is fitted is made to form a perfect contact on the seat and takes up the wear of frequent usage.

AIR GUN FOR BLOWING OFF EQUIPMENT

This type of air gun is suitable for blowing off various pieces of electric railway equipment, such as motors, controllers, and the like, as well as for blowing off chips, filings and trimmings, etc., in machine shops and woodworking mills, and everywhere that a blast of air is required.

Economics of Car Maintenance Through Modern Shop Practice*

Equipment and Methods Which Were Found to Be Successful by the Texas Electric Railway Are Described and S ome Costs of Maintenance Are Given

BY WALTER SILVUS
Superintendent of Equipment Texas Electric Railway, Dallas, Tex.

A VERY important fact in economical maintenance is efficient, careful inspection, preferably on a mileage basis, but if this is impracticable, on a daily, weekly or semi-weekly basis. This work can be taken care of much better by the day crew than at night, the difference of efficiency being fully 25 per cent. Ideal shop layouts are a myth, never just what we would like, and it is necessary to make the best of existing conditions, improving them as money becomes available for this purpose. However, there are a few pieces of equipment which are indispensable on a medium-sized property if we would make a good showing in our maintenance work.

One of the most important pieces of equipment which can be installed in a shop is an electrically operated box crane spanning the repair tracks and serving all the machines. This should be of such capacity as to lift one end of the heaviest cars, so as to remove the truck, carry the trucks and motors to any part of the shop where it is most convenient to make repairs and handle axles, wheels, armatures and all heavy materials brought in for machining.

A machine not usually found in railway shops which I consider a strong link in the chain of economy is a motor-driven wheel grinder using two 4 in. x 24 in. carborundum wheels. This machine will remove a 2-in. flat spot from a pair of cast wheels in three-quarters of an hour and true up the tread and flanges on steel wheels in from one to three hours. It does not require a skilled operator and can be operated in connection with another machine, which makes the labor cost very low. One pair of grinding wheels will grind from 100 to 120 pairs of wheels. The use of this machine in connection with the electric welder has enabled us to get 1,000,000 car-miles out of our 37-in. steel wheels. These wheels have been in service eight and one-half years and some of them have already made more than 700,000 miles. The rolling movement of the wheel tread against the rail and the action of the brake shoes against the tread and flange create a very hard wearing surface which the carborundum grinding wheel does not destroy, while the lathe tool must necessarily go beneath this hard surface and remove from $\frac{5}{8}$ to $\frac{3}{4}$ in. of metal in order to build up a full flange.

The electric welding machine is a money saver. For this particular line of work we have secured the best results with a motor-driven, 20-60-volt, 200-amp. generator mounted on a truck, so that it can be moved to any part of the shop or yard. With this machine we build up the flanges on steel wheels and grind them to their original contour, build up worn-out knuckles and make them last almost indefinitely, weld broken coupler heads, build up axle collars and pinion fits on armature shafts, patch and weld gear cases, brake heads, axle caps, journal boxes, trolley poles, truck and motor frames and many other parts of the car, frequently without removing the part, thus saving the cost of a new part plus the expense of removal and replacement.

Bronze bearings and malleable iron can be handled more successfully with the oxyacetylene outfit, although the expense is greater and it is not as desirable on account of the extra hazard. Both of these appliances have their limits, but if once used around the shop they will be found almost indispensable thereafter.

The installation of a universal, motor-driven, punch, shear, bar, tee and angle cutter, capable of shearing $\frac{7}{8}$-in. plate, cutting 2-in. bars, $4\frac{1}{2}$-in. angles and 4-in. tees and punching $1\frac{3}{8}$-in. holes in $\frac{7}{8}$-in. plate resulted in an actual saving of $10.80 per day on our payroll and in addition enabled us to handle considerable track material which had formerly been taken to outside shops. One paving job we have in mind, requiring the use of 5,300 tie plates, showed a saving of $556.50.

TOOLS FOR WORKING SHEET METAL USEFUL

Since the advent of the steel car, machinery and tools for working sheet metal are almost indispensable, but we find very few electric railway shops with this equipment. The equipment for a moderate sized shop should consist ordinarily of a combination splitting shear and punch, square shear, rolls, crimping and beading machine, folder, brake, drill press with detachable electric drill and a varied assortment of hand tools suitable for this class of work. Tools and machines of this kind are very essential for the repair and manufacture of water coolers, ventilators, smoke jacks, toilet accessories, water pails, oil cans, signs, metal dashes, side sheets, etc.

A system operating 100 cars or more should have the usual complement of lathes, drill presses, boring mill, wheel press, bolt and pipe threader, power or steam hammer, shaper, emery grinders, woodworking machines, electric and air drills, riveting hammer, air compressor, and if special trackwork is built or repaired to any extent a planer and milling machine can be used to good advantage. A generous assortment of good serviceable hand tools is just as essential as good machines; it is the poorest kind of economy to compel workmen to use wornout tools or tools unsuited to the work.

A great many articles have been published in recent years in regard to dipping railway armatures and motors in insulating paint and varnishes. For the past eight years we have used a shop-made paint-spraying machine for the purpose of spraying insulating paint in the interior of motors and field coils and on armature windings and cables. We believe it is possible to coat these parts in this manner and get a better penetration than with any other method, as the operator is enabled to force the paint into any part of the motor he desires and in any quantity. Motor frames and armatures treated in this manner do not hold the dust like those not treated and any dirt accumulating in the motors between inspection periods is very easily blown out by compressed air.

The cost of painting car bodies can be brought back to a pre-war basis by the use of paint-spraying machines and enamel paints for exteriors and ceilings of cars. A change from flat colors, varnish and brush to the enamel system requires constant supervision at the beginning, as the painters do not take readily to it for various reasons. In the first place it upsets their old theories and practice of car painting and secondly the enamel is more difficult to apply than flat colors and varnish and to the painter's eye the car does not present as good an appearance when completed as if painted by the old system. It has been demonstrated to our satisfaction that an enameled job, either on steel or wooden cars, furnishes better protection to the surface and looks better at the end of two years service than a flat color and varnish job at the end of one year. When the enamel system is used it is not practicable to use gold leaf, but 40 cents worth of imitation gold striping color will take the place of $15 worth of gold leaf and ninety-nine persons out of a hundred who ride the car will not notice the difference.

An apprentice boy can learn to operate a paint-spraying machine in a few hours and with a few days practice can do as good work as a high-salaried painter. Priming coats, which in our opinion are the most important of any applied to the car, can be put on more effectively with a machine than with a brush as the spray gives a better penetration than a brush in the cracks and nail holes, therefore holding the putty and surfacer much better than with the brush method. The following coats can be applied as satisfactorily as with the brush with a saving of approximately 50 per cent in labor:

For a burned-off job it is our practice to give the car a priming coat, puttying the nail holes and cracks the day following; to give it a second coat of flat lead the third day, followed up with one or two coats of surfacer, brushed on as heavy as it can be

*Abstract of a paper presented at the meeting of the Southwestern Electrical and Gas Association, San Antonio, Tex., May 3-6, 1922.

Digitized by Google

handled and smoothed out with a glazing knife. When sanded down this is followed by two coats of color enamel, numbered, lettered and given one coat of clear enamel. Five of the seven coats are put on with a paint-spraying machine.

In order to get good results through the use of the sprayer it is necessary to keep the enamel paints at a temperature above 75 deg. while in use. The compressed air must also be free from moisture and oil. These machines are very useful for spraying under trolley boards, roof mats, steps, pilots, trucks, couplers, tanks, etc., requiring only a fraction of the time that would be required if done with a brush.

A slight loss of material is sustained by the use of the spraying machine which is unavoidable, but a greater loss (approximately 6 per cent) in the average paint shop is due to the paints and varnishes drying up when left exposed to the atmosphere. These skins and leftovers can be reclaimed at a slight cost by the use of a grinder costing less than $25, which can be bolted to the line shaft and run when a sufficient amount of material has accumulated. It requires no attention other than filling and emptying the containers and the product is suitable for the use of the carpenters on all concealed work, floors, mortises, etc.

USE PLENTY OF LUBRICANT

If any extravagance in the business is justified we believe it is in the lubrication of cars. Hot boxes are usually ascribed to lack of oil, but whatever may be the cause they are very exasperating both to passengers and operating men. Delays due to this cause result in a direct loss in revenues and are not a good advertisement for the service. Extravagance should not be carried so far as oiling the right-of-way by oil dripping from the boxes, but the proper amount of lubricants should be determined for each class of equipment and the oiling periods spaced so as to eliminate this trouble as far as possible.

Appliances for saturating packing around carhouses and shops as a rule are subject to improvement. In order to saturate waste properly and drain the surplus oil out of it it is necessary to bring the temperature of the oil to about 175 deg. Steam heat is not usually available for this purpose, but a hot water heater can be bought at slight expense and connected to the vats by suitable coils and pipes and will be found very satisfactory. Two vats should be provided, one for saturating new and one for old packing. This equipment, combined with a good filter, will aid materially in reducing the bearing, babbitt and lubrication expenses.

In this connection we have used no tin-base babbitt metal for the past five years. We believe we get just as good service out of a lead-base metal on our heavy motors as we formerly did with a tin-base metal costing more than twice as much.

Gear replacements on some railways are an expensive item in the maintenance column. Gears properly lubricated should last as long as the motors. We have in service gears and pinions on our heavy interurban cars which have been running since 1911. They are still in excellent condition, although for a period of two or three years we had in use a very poor quality of gear lubricant.

First Meeting of Committee on Welded Rail Joints

THE committee on welded rail joints, organized recently under the auspices of the American Bureau of Welding, held its first meeting at the United Engineering Societies Building, New York City, on May 10. The organization of this committee was undertaken, at the request of the committee on way matters of the American Electric Railway Engineering Association, by the Bureau of Welding. This body is the advisory committee on welding research and standardization of the American Welding Society and of the Division of Engineering of the National Research Council.

At the New York meeting the chairman, Prof. G. K. Burgess, Bureau of Standards, Washington, D. C., presided, and the importance of the work of the committee and the interest displayed therein were attested by the large attendance, some twenty-four members out of a total of thirty-seven being present. Those in attendance, in addition to the chairman, were: E. M. T. Ryder, vice-chairman; William Spraragen, secretary; R. C. Cram and H. M. Steward, members of executive committee, and F. L. Abbott, H. P. Bovard, Alex. Churchward, C. H. Clark, G. E. Doan, Prof. D. D. Ewing, C. F. Gailor, H. H. George, C. H. Jewett, H. F. A. Kleinschmidt, E. J. McIlraith, E. C. Price, H. W. Pinkerton, H. J. Tippett, E. Vom Steeg, A. P. Way, W. W. Wysor, G. L. Wilson and F. A. Weymouth.

The meeting approved the action of the American Bureau of Welding in its appointment of the chairman, vice-chairman, secretary and executive committee, who have served during the preliminary organization period. The following officers were elected to serve for the ensuing year: Prof. G. K. Burgess, chairman; E. M. T. Ryder, vice-chairman; William Spraragen, secretary; C. A. Adams, R. C. Cram, E. J. McIlraith, H. M. Steward, G. L. Wilson and W. W. Wysor, executive committee.

The vice-chairman reviewed the progress made to date and presented Progress Report No. 1, which contained a printed summary of the replies made by the members to the four inquiry schedules covering information on the state of the art and investigations to be undertaken in each of the following types of rail joints: Cast iron-welded joints, electric resistance-welded joints (bar welds and butt welds), electric-seam-welded joints (carbon electrode and metallic electrode), and thermit-welded joints.

Discussion of each of these types of joints was introduced by members previously selected to lead the discussion and the particular features of each joint which seem to need further study were brought out in the general discussion. The various tests which may be necessary to compare the relative merits of the joints were then considered and it was concluded that each type of joint should be made up with the use of Association Standard 7-in. grooved girder rail, Class B, and that three test specimens of each type of joint should be prepared by users and by manufacturers. The following tests are to be made to destruction: tensile test, drop test and cross bending test.

A plan of a proposed rotary service testing machine was presented by W. W. Wysor, together with an estimate of its cost and the cost of operation. The proposed machine would cost about $14,000 to build and operate for one year. With this machine, accelerated wear tests of joints could be conducted and within a few months the wear of several years could be effected. The development of such a device, or some other service testing apparatus, involves the question of finance. Further consideration of the matter was left to the executive committee.

Mr. McIlraith presented plans of a proposed impact testing apparatus for testing full sized specimens, having rail heads planed down to simulate several years of wear. Prof. Ewing called attention to a device which had been used for somewhat similar tests at Purdue University, and which might be available for some of the desired tests. The executive committee is to investigate the apparatus and test methods and formulate plans following the receipt of information as to available funds.

All members agreed to prepare full-sized test specimens, and manufacturers' representatives stated their belief that the rail needed would be furnished by their companies. A tentative budget of the expenses of the committee for one year shows the need for at least $15,000 and the members were requested to advise the secretary within the next two weeks as to what financial assistance the committee might expect from the companies represented. It is hoped by the committee that all of the companies will agree to contribute a pro rata share of the annual expense as the benefits to be derived from having authoritative information on the welded rail joint problem should be worth untold sums to each company.

Tie Spacing in Fort Worth

IN THE abstract, printed in the May 6 issue of the ELECTRIC RAILWAY JOURNAL, of the paper read by R. G. Taber, at the San Antonio meeting of the Southwestern Electrical & Gas Association, an error appeared in Table II on page 756. The number of ties per mile should be 2,650 instead of 2,262.

Digitized by Google

California E.R.A. Elects New Officers

AT THE annual meeting of the California Electric Railway Association, held in San Francisco on May 8, the following officers were elected for the ensuing year: President, W. E. Dunn, vice-president Los Angeles Railway Corporation; vice-president, William von Phul, president Market Street Railway; executive board, W. E. Dunn, W. R. Alberger, William von Phul, Paul Shoup and John A. Britton. W. V. Hill continues as manager.

A resolution signed by all present expressed to Mr. Alberger, the retiring president, their "very great appreciation of his direction of affairs of the association during the most troublesome period of the history of the electric lines of California."

There was a tone of optimism in the discussions, centering around the fact that, in spite of increased operation costs, burdensome franchise requirements and jitney competition, there have been no receiverships during the past few years.

New England Street Railway Club

THE May meeting of the New England Street Railway Club will be held at Manchester, N. H., on May 25, 1922, to observe the fiftieth anniversary in the street railway industry of E. C. Foster, president Manchester Traction, Light & Power Company.

There will be a trip by trolley cars around Manchester in the morning. In the afternoon there will be a meeting at the Massabesic Lake Theater, at which Frank E. Webster, vice-president and treasurer Massachusetts Northeastern Street Railway, will read a paper on "History of Street Railways and Power Development in New Hampshire." This paper will be followed by a musical comedy.

New Jersey Utilities Prints Mr. Baker's Paper

ONE of the interesting papers at the last convention of the New Jersey Utilities Association, held in Atlantic City, Nov. 18-19, 1921, was read by Ralph J. Baker of Harrisburg, Pa., on "The Right to Judicial Review of Commission Action." The association voted to print the paper and copies are now available in the form of a pamphlet of 44 pages.

Mr. Baker first discusses the historical basis of regulating commissions and their status in law and in government. On this point he declares that the American system of government was long considered as divided into three branches, the judicial, the executive and the legislative. If these are regarded as completing the cycle, commission government can be considered as belonging to the executive branch. Practically, however, it partakes so much of the features of all of the other three, and yet is none of them, that Mr. Baker thinks it could well be assigned a distinct position.

In his review, the author also considers whether the legislature may confer upon the commission the power to determine whether its own rates are confiscatory, and in general the extent to which federal and state courts may review the question of whether they are reasonable.

Meeting of Chamber of Commerce

THE tenth annual meeting of the Chamber of Commerce of the United States was held in Washington this week beginning on Tuesday and concluding on Thursday. General sessions were held in the morning and in the afternoon there were sectional meetings of the following groups: Civic development, domestic distribution, fabricated production, finance, foreign commerce, insurance, natural resources production, transportation and communications.

The subject of the meeting as a whole was "European Conditions and Their Effect on American Business" and most of the addresses were on some phase of this subjct. The speakers included President Harding, Secretaries Hughes and Hoover and many men prominent in industrial finance and railroad work. The American Electric Railway Association was represented at the meeting by a delegation with L. S. Storrs as chairman. As this paper has to go to press while the final session is in progress, the results of the election cannot be given until next week. The council nomination for director of the National Chamber of Commerce from the fifth district included John W. Shartel, vice-president Oklahoma Railway.

Practically all of the speakers at the convention stressed the close relation between American business and the European financial situation. These recommendations included stabilization of exchange, adjustments of the budgets of the nations of Europe so as to make the income equal to the outgo, definite settlement of the German reparation question and the return to normal business conditions in Russia. The speakers in general declared business conditions in this country to be on the upgrade.

Statistics on Prices, Wages and Fares

A CHART showing the fluctuation in wages, railway fares and the wholesale prices of commodities formed part of a paper presented at Nashua, N. H., on March 16 before the Merchants' Association, Rotary Club and other organizations in that city by Walter H. Burke of Stone & Webster. The chart is reproduced on this page.

The address by Mr. Burke was an informal one but put in clear language the predicament of the electric railways brought about through the higher cost of materials and labor and only a slightly increasing average fare. He also pointed out the evils of jitney competition.

In commenting upon the need for more capital in the industry, Mr. Burke said that in normal pre-war times about $250,000,000 a year had been estimated as the amount required, in addition to that needed to meet maturing obligations. With construction costs 50 per cent higher in the future and with the large amount of work which the companies should have done during the past six years but could not finance, he said the amount now needed was possibly twice as great as that just quoted. In the interests of all, a considerable part of this at least should be raised by the sale of common stock, rather than by the sale of senior securities.

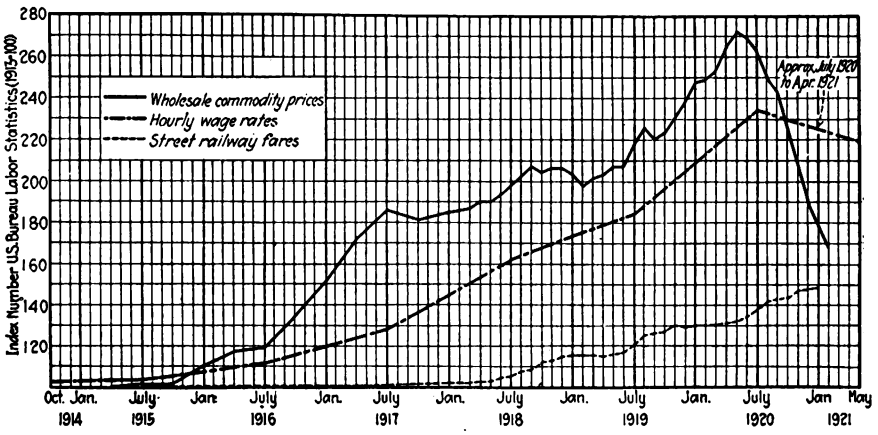

CHART SHOWING CHANGES IN WHOLESALE COMMODITY PRICES, HOURLY WAGE RATES AND STREET RAILWAY FARES

American Association News

High-Water Mark at Hartford

THE Connecticut Company section held its May meeting at Hartford on the eleventh. The meeting began at 5 p.m. in the Wethersfield Avenue carhouse with an open-air concert by the Connecticut Company Section Band. Next a dinner, prepared by the ladies of the Hartford Division, was served to 248 persons in the carhouse auditorium.

Digitized by Google

After dinner S. W. Baldwin introduced Mayor Kinsella of Hartford, who compared former with present day car service, which he stated was in general very satisfactory.

Then came short talks by the following: N. J. Scott, who reviewed his first year's work as manager of the Hartford Division; Ralph Martin, traffic engineer, who spoke on "Checking of Traffic by Street Observation"; H. Jackson Tippet, division engineer, and F. P. McKaig, roadmaster, of the Hartford Division, who spoke on "The History of Track and Pavement Construction"; Leslie Spraggon, supervisor of equipment, whose subject was "Railway Equipment and Shop Efficiency"; Joseph F. Berry, formerly attorney for the company, who related some amusing court experiences, and L. S. Storrs, president of the company, who emphasized the slogan: "Better Service for the Public."

Way Committee's Third Meeting

THE Engineering Association committee on way matters met in New York City on May 11 and 12. Vice-Chairman H. H. George presided. Present also were C. A. Alden, V. Angerer, S. Clay Baker, R. C. Cram, W. R. Dunham, Jr., E. B. Entwisle, H. Fort Flowers, C. F. Gailor, E. P. Roundey, F. Tingley, W. W. Wysor, C. H. Clark, G. E. Doan, H. F. Heyl, E. J. McIlraith, H. M. Steward and George L. Wilson. The topics considered were as follows:

The sub-committee on curved contours for wheels presented with its report several drawings illustrating its views with respect to its proposed compound fillet connecting the tread and flange. These will be included in the final report, together with a monograph, by Mr. Flowers, on the theoretical and practical questions involved. This sub-committee also reported (with drawings) on proposed flanges having a uniform thickness compared with those with graduated thicknesses. Conference with the equipment committee had indicated a belief that the proposed flanges are impracticable from the manufacturing standpoint.

On arc-welded joints, a sub-committee explained the results of the research made in conjunction with the committee on welded rail joints (see report on page 834, which showed that there is no uniform method of making arc-weld joints. Plans for a testing machine, with cost estimates, was presented by Mr. Wysor, and they were in general approved. Copies of "Progress Report No. 1" of the committee on welded rail joints were distributed by Mr. Ryder. Messrs. McIlraith and Doan also discussed the subject of fatigue tests of metals as applied to welded joints.

Under the topic of wood preservation a modification in the recommended specifications for creosote oil made last March by the A.R.E.A. was recommended for adoption in the similar specifications recently adopted by the Engineering Association.

Under "revision of specifications for girder rails" reports presented indicated that the committee's proposed substitution of the impression test for the drop test is practicable.

No action was taken with respect to standardization of branch-off frogs.

The sub-committee on electrolysis next presented a report which was accepted.

As to a tie-rod specification, one which was proposed was referred back to a sub-committee for revision.

On substitute ties a progress report was presented with a recommendation that the subject be continued next year.

The last topic discussed was co-operation with the American Society for Municipal Improvements on the design of track construction for paved streets. So far a meeting of the committees concerned has not been arranged.

The committee adjourned to meet, probably, in Quebec, on June 1 and 2. Following the meeting the committee witnessed a demonstration in Jersey City of thermit welding of rail joints done in accordance with a new procedure which the manufacturers have perfected.

Educational Syllabus Planned

THE outstanding feature of the meeting of the American Association committee on education, held in New York City on May 15, was the following: It was agreed that the report for this year should consist of an outline of a complete educational program for an electric railway property. This will follow the topics listed in a questionnaire recently sent to all company members. The several subtopics will be treated by different members of the committee.

Another item considered was the publication in *Aera* of a series of "theses" prepared by members of the committee, each giving his own point of view with regard to the subject. A number of these "theses" were presented at the meeting. Examples of these are given in brief abstract below:

One member presented a complete outline of co-operative courses for assisting men already employed, and for training electric railway executives by giving college men practical training during their student days. This plan is proposed by the Massachusetts Institute of Technology. It comprises two parts: (1) For the skilled workman and minor executives, a two-year evening course entitled "The Lowell Institute Course for Industrial Foremen." (2) For the training of higher executives, a five-year co-operative course for electric railway engineers.

The first of these offers to men employed during the day with electric traction companies, and already familiar with practical details, the advantage of scientific instruction in the fundamentals of electrical engineering. The second course will be similar to the co-operative courses already in successful operation for training electrical engineers for manufacturing industries and large power companies.

Another "thesis" summarized the situation as follows:

Like all great industries, the electric railways of the country have for many years felt that they should do something to insure a better quality of new recruits for the several branches of the business and also to train those already in the service more effectively to perform their duties. Obviously this is a broad field for endeavor, and results can be secured only if there is intense conviction as to the needs for educational activity, and a capable personnel behind the movement.

The American Electric Railway Association has appointed a committee on education to act as a clearing house for information as to what has been done and is being done along educational lines by electric railways, and to formulate plans which will be helpful in furthering this essential work. The efforts of the committee can succeed only if there is enthusiastic co-operation all along the line.

This phase of the work of electric railways naturally divides itself into the following parts:

(a) Co-operation with educational institutions, technical and otherwise, with a view to letting young men know about the opportunities in the electric railway field, and encouraging the offering of such courses of instruction as will best fit young men for this field.

(b) The training of young men who have been accepted for employment by the electric railways with a view to enabling them to become adapted to their duties promptly and to fit them for promotion.

(c) Teaching the various trades which are represented in electric railway operating practice.

Previous educational committees of the American Electric Railway Association have attempted to do work along all of these lines, although in general not in a comprehensive way covering the whole situation. At one time a cadet system for engineering graduates was recommended, and it was tried out on a considerable scale by one or more railways with good success. Another year a correspondence course was conducted.

This year the plan is to prepare a report which will "give a cross-section" of the educational work of the electric railways of the country. That the work is important no one will deny. The practical problem is how to get the required co-operation.

The New York meeting was attended by these members: Edward Dana, general manager Boston Elevated Railway, chairman; T. S. Wheelwright, Richmond, Va.; W. H. Timbie, Boston; M. B. Lambert, Pittsburgh; E. J. Blair, Chicago, and H. H. Norris, New York.

Chamber of Commerce Delegates

THE American Electric Railway Association is a member of the Chamber of Commerce of the United States, and is entitled to send ten delegates to the annual meeting of the chamber. Although there were on the program of the chamber this year no papers of direct railway interest, President Todd appointed ten delegates to represent the association at the annual meeting in Washington this week and an equal number of alternates. A meeting of these representatives was held at the Washington office of the association on May 16. Those present included L. S. Storrs, chairman of the committee, and Edward Dana, Boston; J. N. Shannahan, Hampton, Va.; E. J. Blair, Chicago; John N. Hanna, Washington; W. J. Harvie, Syracuse; Calvert Townley, New York; K. A. Simmon, Pittsburgh; Charles C. Peirce, Boston; H. W. Blake, New York, and L. T. Blaisdell, Washington, representing J. R. Lovejoy, New York. These representatives attended meeting of the national chamber and will present a report upon the meetings to the executive committee of the Association.

$400,000 for Improvements

Saginaw Lines Would Be Rehabilitated Under Franchise Plan Now Before Council

Reorganization of the Saginaw-Bay City Railway, in the bankruptcy courts since Aug. 10 last year, is proposed through the granting of a twenty-five-year franchise to the trustee, Otto Schupp, as far as Saginaw is concerned.

The members of the Council conferred on May 16 with Mr. Schupp and it was practically decided that before anything further is done, the citizens transportation committee, which made a demand on Feb. 14 for the resumption of electric railway service, present to the Council an initiatory petition calling for a submission of the franchise to the electors.

There are five main points in the proposed franchise as follows: Time of grant, twenty-five years; the rate of fare, twenty tickets for $1, four tickets for twenty-five cents, 10-cent cash fare; universal transfers, motor bus auxiliary and elimination of all competition. The company is to be relieved of paving requirements except the necessary ballast in the roadbed because of the use of the streets for cars.

Proposed Plan Is the Best Possible, Says Schupp

The reorganization of the company, Mr. Schupp said, contemplated the issuance of 10,000 shares of common stock of no par value, the issuance of $584,000 of first mortgage 5 per cent bonds to replace outstanding Saginaw Valley Traction Company bonds, and additional bonds in an amount sufficient to rehabilitate the property and purchase buses to serve factory districts not touched by electric railway extensions at the present time.

The proposed new company would be operated by the Commonwealth Power, Railway & Light Company, Mr. Schupp said, independent of any of the present local utilities owned by that organization. He even went so far as to say, "in offices apart from their present quarters."

The entire plan is for Saginaw only, and Mr. Schupp told the Council that the new company proposed to spend at least $400,000 in betterments and in repairing the present right-of-way and the installation of new trackage in two main streets this year and one next year.

Settlement of the question, which has been before the city since the suspension of railway service, is necessary now because of the paving program of the department of public works, which includes a trunk line road that has been made a Federal and state aid project, from Hartsuff Street at Genesee Avenue to the southerly city limits, a distance of more than a mile. Under the plan the outside sources pay for 20 ft. of the pavement. The city is very anxious to secure this assistance. For more than half the distance the tracks of the company run along the side of the street and the state and Federal engineers want the tracks placed in the center of the road.

In discussing the various phases of the question, Mr. Schupp said the proposed franchise was the best possible if those who were putting their money into the venture were to get anything back and "they told me," said Mr. Schupp, "when I was in New York if the deal did not go through to close up the property."

Employees Suggest Wage Cut—Company Refuses to Accept

The employees of the Paducah (Ky.) Railway recently volunteered to accept a reduction in the existing scale of wages which has been in effect since the war. The company is managed by Stone & Webster, Inc., who also operate the Paducah Electric Company. It has been the practice of the management to inform the men each month of the financial result of the operation of the property and to pursue a policy that will thoroughly acquaint the men with the problems of operating a street railway.

Lately, due to the business depression, the earnings of all the lines of the system have fallen considerably below those of the same period last year. The loss in revenue was a matter of discussion at the weekly meetings of the men. The company did not accept the offer of its men for the reason that it feels the present depression is more or less temporary and with such splendid co-operation it hopes soon to regain a measure of prosperity.

Supreme Court Remands Covington Case

In the United States Supreme Court on May 15 Justice McReynolds handed down a decision reversing the action of the District Court for the Eastern District of Kentucky in the case of the South Covington & Cincinnati Street Railway vs. the City of Newport, Ky. In this case the city of Newport ordered the railway to remove overhead cables. The railway resisted, contending that the order was unconstitutional as it impaired its obligations under its contract with the city and taxed its property without due process of law. The District Court dismissed the action for want of jurisdiction, but the Supreme Court in the McReynolds decision reversed this action and remanded the case to the Kentucky court for further proceedings.

New Schedule Accepted

Boston Elevated Cuts Wages Two Cents on July 1 and Two Cents on Jan. 1 Next

Members of the carmen's union of Boston, Mass., have accepted a cut in wages amounting to 2 cents for six months from July 1 to Jan. 1, 1923, and 2 cents more from Jan. 1 to July 1, 1923. In his announcement General Manager Dana of the Boston Elevated said that the board of trustees amicably adjusted the wages upon the same principles as those upon which the adjustment was made a year ago and that the trustees have been assured of the continued co-operation of the employees affected in the effort to operate the system efficiently and economically in the interests of the car riders. These principles, upon which the cut was made, follow:

1. The fact that although a substantial decrease has already taken place in many items affecting the cost of living, that cost is not yet upon any settled basis, so that it is peculiarly a fitting time to put in practice the belief of the trustees that to be consistent they should be as deliberate and conservative in following the cost of living when it is upon a downward trend as in following it when it is in an upward movement.
2. The fact that they thoroughly appreciate the co-operation that the men have given to the management during the past year. The existence of this spirit has financial as well as other value in the conduct of this service.
3. The fact that as public officials they are in charge of a public business and should be careful not to follow any other rule than that of a full fair wage for work that is earnestly performed.

The new schedule of pay for the men in the employ as stated officially in an announcement of the company in cents per hour is as follows:

CONDUCTORS' AND MOTORMEN'S RATES

		Present	July 1, 1922 to Jan. 1, 1923	Jan. 1 to July 1 1923
Minimum	three months	52	50	48
Intermediate	nine months	58	56	54
Maximum	thereafter	65	63	61
ELEVATED MOTORMEN'S RATES				
Minimum	three months	61	59	57
Intermediate	nine months	62	60	58
Maximum	thereafter	67	65	63
ELEVATED GUARDS' RATES				
Minimum	three months	56	54	52
Intermediate	nine months	57	55	53
Maximum	thereafter	60	58	56

Mr. Dana's statement says that the maximum rate for conductors and motormen on July 1, 1922, will be 63 cents and on Jan. 1, 1923, 61 cents. The basic rate reached on Jan. 1, 1923, will be a maximum reduction of 6 per cent. A corresponding reduction will be made in all other rates. On the pay for one-man car operation he says that the differential rates paid to operators of one-man cars is reduced 20 per cent, the new rate being 8 cents an hour in addition to the regular rate.

All Detroit Lines Now Municipally Owned

City Takes Over Entire Local System of D. U. R. Without Confusion—Department Heads of Municipal System Given Jurisdiction Over Enlarged System—D. U. R. Employees Taken Over Except About 200

AT 12:01 A.M. MAY 15, the railway system owned and operated by the Department of Street Railway, City of Detroit, was suddenly increased by purchase of the city lines of the D. U. R. from 90 to 363 miles of single track line, the number of cars was jumped from 428 to 1,457, and the 1,000 employees became 4,000, approximately. This significant change, marking the transition of a great private enterprise into a municipal undertaking, took place quietly and free from confusion as the hands of the clock passed the zero hour.

The innumerable details incident to the transfer had apparently been so thoroughly foreseen and prearranged for and the offices of the Department of Street Railways on that eventful day May 15, were so peaceful and calm that it was difficult to sense anything out of the ordinary in the course of that day's business.

Former D. U. R. Employees Now City Men

In general, Detroit United Railway employees engaged in the city service were largely taken over by the city except for department heads and those filling about two hundred other positions of various kinds and degree of importance. All department heads of the municipal system became the corresponding heads of the enlarged system and they received salary increases commensurate with their increased responsibilities. On the other hand, the D. U. R. department heads and sub-heads fared not so well, several resigning, others receiving substantial salary reductions and still others losing out altogether, as the scope of the system narrowed down to a strictly interurban property. The city attempted to take care of the D. U. R. employees just as far as practicable, bringing them over at the same or increased salary and wages.

In several trades the rate of wages was increased a few cents to equalize differences between the D. U. R. and municipal scales. Trainmen, for whom the D. U. R. had proposed a new reduction in wages, were transferred with the same working conditions and the same rate of wage (60-cent maximum) and assured there would be no change, at least for some time to come. As their seniority was by lines, they were placed on the boards in the same positions previously held. The municipal system was simply made one division of the whole, now comprising seven divisions, and named the Shoemaker division. All of the former division superintendents and assistant superintendents were retained in their positions. Simultaneously with the transfer of the property on the morning of May 15, thirty-six new car schedules were placed in effect and one important route extension was made. Various other schedule and route changes are also contemplated in the near future for the general betterment of the transportation facilities, whereby ideas of the D. U. R. and municipal officials along this line will be put into effect. It is also contemplated that the Myrtle Street line will shortly be operated with one-man safety cars, sufficient cars of this type being available to replace the single-truck, two-man cars now used.

TERMS OF PURCHASE CONTRACT WITH PRIVATE COMPANY
Approved April 17, 1922
Effective May 15, 1922

Price	$19,850,000
Down payment	$2,770,000
Payment method:	
Bond issue of $4,000,000, authorized to make down payment and buy current stock of supplies.	
Installments, semi-annually	$500,000
Interest	6%
Balance	10 years
Tracks	273 miles, 90% paved
Cars	1,029
Real estate, value approximately	$8,000,000
Power stations:	
Two, furnishing 50% of total supply.	
Interurban rights:	
Running rates fixed by Board of Arbitration. Rights can be terminated on two years' notice.	
Total combined systems:	
Miles	363
Cars	1,457

Department Moved Bodily

One of the most difficult problems in connection with the property transfer was the moving of the department which receives, sorts and counts the receipts as turned in from the locked fare boxes. This department finished its work at the D. U. R. offices on the Sunday receipts, which belonged to the private company, at about 4 p.m. Monday. Between that time and 9 a.m. the following morning the three coin sorters and eight Satley coin counting and wrapping machines were moved to the new office building just being built for the department of street railways and set up and made ready for operation when the accounting department employees reported for work Tuesday morning, Monday's receipts belonging to the city.

It requires many thousand words in the legal documents to describe the property purchased by the city, but a general idea of it can be rather briefly summed up as follows: The city took over practically all the track and overhead within the city limits except that serving freight terminals and otherwise used in strictly interurban business. All freight terminals were retained by the D. U. R. The city received all substations, air stations, carhouses, battery stations and the two power houses. It received all of the Highland Park shops except the paint shop and the 15 acres of ground on which it stood, separated from the other buildings in the shop group by Third Avenue.

More Than 1,000 Cars Taken Over

The rolling stock purchased comprised 173 single-truck closed motor cars, 592 double-truck motor cars, 196 double-truck trailers and sixty-eight service cars, or a total of 1,029 cars. The city had previously taken over 105 double-truck motor cars and twenty-three double-truck trailers in connection with the purchase of 30 miles of the line built by the D. U. R. under the day-to-day agreement. This brings the total cars purchased from the D. U. R. up to 1,157, which, added to the 250 safety cars and fifty Peter Witt cars previously owned by the city, makes a grand total of 1,457 cars on the present system. The D. U. R. retained 170 single-truck closed cars, fifty double-truck trailers, eighteen double-truck motor cars and all single-truck open cars. The last named are being burned.

The retention of the paint shop by the D. U. R. will require the city to build a new paint shop and shop office and stores building (275 x 237 ft.) in the immediate future. There is ample ground space adjacent to the other shop buildings for this purpose. The second floor of the present paint shop is being fitted up to serve to house the general offices of the D. U. R., which will be moved from the interurban terminal building downtown to this outlying location immediately. A 150-ft. addition will be built in order to provide shop facilities adequate for the interurban system.

Catching Up With Deferred Maintenance a Problem

Among the immediate tasks of the municipal railway organization will be the work of picking up deferred maintenance on track, line, power facilities and rolling stock, for which a budget is being worked out. On rebuilding the worst portions of the property, the department officials will go to the limit of the financing arranged. For example, a rough survey indicates that from 12 to 15 miles of double-track overhead will have to be rebuilt at once. As to rolling stock, 200 new cars are needed immediately. The D. U. R. has purchased two-thirds of its power requirements from the Detroit Edison Com-

Digitized by Google

pany. These contracts expire July 1, 1922, and the Edison company has declined to renew the agreement to supply all of the energy required. The municipal system has been buying all its energy from the Edison company and the Public Lighting Commission has exceeded its capacity and is also buying from the same source. Hence the power problem, taking into account these various requirements, is pressing and some plan will probably be devised within a month or two which will likely involve a new source of supply.

Thirty-Year Controversy Brought to an End

ONE is fairly lost in the moves and counter moves that have been made in the Detroit situation. For thirty years railway matters there have been in the public eye. Some day no doubt a historian will arise who will set down the record of events for posterity, but unless that historian is a disciple of the romantic school the product will be pretty dull reading. If the time is not too remote when this work is begun then a story ought to result that would be enthralling. The man who does the task, however, will need to get back of the facts to the persons who directed the various moves and disclose if he can the actuating motives. Perhaps some such account will be made available when the record of the life of Mayor "Jim" Couzens is written. Just now the problem is to sketch the outstanding moves in recent years, keep within reasonable bounds of space and guard this record from becoming dull and deadening.

Municipal Ownership Suggested Thirty Years Ago

Mayor Couzens had several forerunners in his campaign for municipal ownership in Detroit. Way back in the '90s none other than Tom L. Johnson, in conjunction with the late Mayor Hazen S. Pingree of Detroit, is discovered urging municipal ownership in Detroit. The necessary legislation for the purchase of the railway by the city was passed, and the bill was signed by the Governor. Prospects were pleasing for the accomplishment of this end, but the Supreme Court of Michigan declared the municipal ownership law to be unconstitutional. Then the holding company idea was hit upon, the proposal being for the city to buy the system and turn it over for private operation. The sale price was fixed at $16,000,000, but Mr. Johnson was accused of an attempt to bleed the city. In consequence of this the Council became frightened, the negotiations were broken off, and the ordinance permitted to die. There in brief is the record of what is believed to be the earliest attempt to accomplish the end which Mayor Couzens has achieved. Tom L. Johnson is dead and all but forgotten except in Cleveland, but out on Woodward Avenue in Detroit there is a statue of Hazen S. Pingree.

What a different story the closing chapters have been in the negotiations now concluded when they are compared with the attempt by Mr. Johnson and Mr. Pingree to bring about municipal ownership. The answer is found not in the fact that Mr. Johnson, who waged a bitter war later in Cleveland, was not the equal of Mayor Couzens, but that Mayor Couzens and the forces aligned on the side of municipal ownership in Detroit were aided and helped by circumstances that worked materially in their benefit. The record of these is found very largely in the weapon which the city was able to bring against the company on account of the expiring franchises. On every side after the final court decision, the Detroit United found itself confronted with threats of the remorseless use of the ouster. The company had become a trespasser on many streets through the expiration of its franchises. It was operating on sufferance under so-called day-to-day agreements. The Supreme Court decision in the famous Fort Street Case, pretty well sounded the fate of the company that even a change in ownership could not avert. More than a year ago Alexander Dow and others with a record of getting on well in Detroit and other cities where they own and control utilities made themselves factors in the councils of the company, but it was too late. Finally the Canadian interests in the company asserted themselves with the result that the negotiations were concluded upon which the sale has been accomplished to the city at the price of $19,850,000, with an initial payment of $2,770,000 and $500,000 semi-annually.

The Beginning of the End

The concluding stage of the agitation against the company was begun in 1918. "Jim" Couzens had recently accepted some $30,000,000 from Henry Ford for his interest in the Ford Company. With the great bulk of this sum invested securely in municipal bonds Mr. Couzens cast about for something to do. The bug of political office stung him. He was overcome with a desire to become a champion of the people. Well, there was the job of Mayor. Somebody had to fill that office. Why not "Jim" Couzens? So Mr. Couzens proclaimed himself a candidate. Now proclaiming yourself a candidate is one thing. Getting yourself elected is another. A politician with a burning desire for office would have proceeded by formula to attain the desired end. A mere citizen imbued with the same ambition had to pursue a different course. And "Jim" Couzens did it. At that time the Detroit United Railway was charging a 6-cent fare. James Couzens with his private auto close at hand boarded a Detroit United car. He tendered the conductor 5 cents. This the conductor refused to accept. Plain Mr. Couzens stepped off the car to the tune of clicking cameras while newspaper men made notes. "Jim" Couzens had accomplished his end. The conductor who refused the 5 cents remained a conductor, but a few months later Detroit recorded its gratitude to Mr. Couzens by electing him Mayor. The battle was then on in earnest.

But before this "Jim" Couzens had felt the political urge. He had previously been a member of the city street railway commission. Later Mayor Marx appointed him police commissioner to clean up Detroit. He cleaned it up, too. Once when a strike had seemed certain on the Detroit United Railway Mr. Couzens had threatened to turn on the streets of Detroit the entire production of the Ford factory to carry the people if the railway men went out. This was a terrible threat. Luckily for Detroit Mr. Couzens was not called upon to put the threat into execution. Once before when the railway had attempted to collect 6 cents and the crews had stalled the cars in the streets "Jim" Couzens as Police Commissioner arrested the crews.

"Jim" Couzens had promised the people municipal ownership if he was elected. As one of the early moves toward that end Mayor Couzens started the construction of a city-owned railway system in territory not served by the Detroit United. The record of the progress of that undertaking had been written from week to week in the ELECTRIC RAILWAY JOURNAL. Some of the outstanding technical features of that construction have also been described in these pages. As explained previously it is the organization that was built up to run these lines that will operate the combined lines now.

Municipal ownership might have come eventually even if Mr. Couzens had not been elected Mayor. Whether or not it would is something for the prophets to fight about. Mayor Couzens entered on the building of the municipal lines only after the voters had turned down the proposal of the Detroit United to sell for about $31,000,000. It must not be supposed, however, that the city is now getting for $20,000,000 all that it would have got under the $31,000,000 offer. Far from it. In the first place it is several years now since that offer. Meanwhile the property has deteriorated, for the company could hardly be expected to be lavish in expending money on a system that was confronted with such great uncertainty as to its future. Moreover, the company has retained for the use of its interurban lines certain valuable properties that were included in the original offer of $31,000,000.

Meanwhile, "Jim" Couzens came up for re-election. He won by 30,000 where before he had only a few thousand majority. Things began to happen at once. The battle of the Detroit United for the preservation of its rights had been fought through the courts. The Supreme Court had said that the franchises for the Woodward and other important lines had all expired. An offer was made by the city for the lines. It was considered by the company to be so low as to be ridiculous. The answer of the city was: Sell out or

*M—Formerly with municipal railway.
†D.U.R.—Formerly with Detroit United Railway.

get out. In accordance with this ultimatum an ouster ordinance was passed, but it was never executed, for the negotiations were soon begun which have terminated in the present sale.

Here is the record of some of the principal moves made since 1918, arranged in chronological order:

In July, 1918, the Detroit Street Railway Commission reopened negotiations with the company for the purchase of its properties upon some agreeable basis.

On Feb. 12, 1919, the company declined the city's offer to purchase the lines within the 5-cent zone for $29,653,936.

The company shortly thereafter made a counter proposal that the city lease the properties at an annual rental of $2,000,000. This was rejected by the city officials and the Street Railway Commission.

On March 10, 1919, an agreement was reached between the company and the city officials for the sale of the company's properties to the city at a compromise price of $31,500,000. The voters rejected this proposal at the election on April 7 that year.

On April 4, 1920, an ordinance providing for service-at-cost was defeated. This plan provided for combining the city-owned lines and the private lines.

In February, 1921, the United States Supreme Court validated the municipal ownership ordinance and reaffirmed the right of the city to order the D. U. R. off streets where its franchises had expired.

Last fall the ouster ordinance was passed by the Council, but the forcing of the company from the streets where franchises had expired was delayed pending renewal of the purchase negotiations.

On Dec. 15, joint operation over certain of the company's lines and certain of the city's lines was begun.

On Dec. 22, 1921, 29½ miles of Detroit United lines were taken over by the city following arbitration in which the price for these lines was fixed at $2,297,700.

On April 17, 1922, the voters approved purchase of the company's lines for $19,850,000.

On May 15, the lines were taken over, in accordance with the general terms noted elsewhere in this account.

With respect to fares, these were changed from time to time under authority from the courts and in accordance with agreement with the city. The record of all these moves and counter moves forms a basis for a separate history the importance of which has now become mostly a significance of the hour.

This story, as a story, would not be complete without further reference to the attempt to arrange for service-at-cost grants in Detroit as a way out of the situation that developed there. Mayor Couzens flatly refused to commit the city to the service-at-cost plan. Despite this, however, Detroit just narrowly escaped an arrangement similar to the one which has proved so advantageous in Cleveland. The service-at-cost proposal for Detroit had a strong following, but Mayor Couzens proved obdurate. He refused to put the plan to referendum. The company, however, went right into the hall of the Common Council with its proposals. The Council inclined toward the plan, passed the necessary enabling resolutions and ordinances, but these the Mayor promptly vetoed. The Council then moved to pass the measure over the Mayor's veto. That body nearly succeeded in doing so. It was only the vote of a single Councilman that prevented this measure from going into effect.

The sale of the properties in the city to the city will leave the Detroit United Railway with 600 miles of interurban lines. Including real estate, cars, overhead equipment and valuable rights in Flint and Port Huron, the 600 miles will, if city payments totaling $19,850,000 are applied to reduce the "cost of property" account, stand on company's books at slightly less than $40,000,000.

Applying city payments to reduce the bonded debt total of $35,221,500 (Dec. 31, 1921) the remainder will be $15,371,500, or at rate of $25,618 per mile. An authority of the affairs of the company says that some idea of the effect of purchase may be had by assuming immediate effect of sale payments and changing the Dec. 31 statement accordingly. This would then show:

ASSETS	
Cost of properties (600 miles)	*$39,712,566
Sinking fund	64,962
Other investments	431,565
Inventories	1,621,201
Cash and accounts receivable	1,902,009
Deferred charges	438,915
	$44,171,218
LIABILITIES	
Bonded debt (600 miles)	†$15,371,500

Reserves, etc.	1,848,082
Current liabilities	2,921,279
Capital outstanding	15,375,000
Surplus	8,141,665
	$44,171,218

*$59,562,000 less $19,850,000 city payment.
†$35,221,500 less $19,850,000 payment.

It is pointed out that additional factors in the city purchase contract are provisions that city pay 6 per cent on unpaid balances of purchase price and take over practically all the company's inventory of materials and supplies. Inasmuch as company's long term debt is largely financed at 4½ per cent it is estimated that the 6 per cent interest clause means an advantage of around $1,000,000. Sale of its inventory for city lines means half a million or more immediate income.

This balance sheet shows in a general way how the situation will stand in Detroit after the city lines of the Detroit United Railway have been taken over by the city. Like most other tabulations, however, the figures need some elaboration. They show clearly that fewer than 300 of the 900 miles of the company are located within the city of Detroit, but they give no idea of the extent of the rest of the system or of its value as a money maker. After all, it is the interurban properties of the company that really count. In addition to owning the city systems in Flint, Pontiac, Ann Arbor, Port Huron, and

Digitized by Google

one or two other fairly important Michigan towns, there are interurban lines tying all of these places with Detroit. All of these lines are also in the so-called automobile belt. This means a great deal from the money-making standpoint to the Detroit United Railway. It is to these lines that the Detroit United management will now turn all of its attention. With the management freed from the trials and tribulations which have gone with the running of the local lines in the city of Detroit, it is only reasonable to expect that the development of the interurban lines will be carried on to an extent that will make of them even much greater earners in the future than they ever have been in the past. This is saying a great deal, for the interurban lines of the Detroit United Railway have in times past been exceedingly prosperous, though not showing up as well under present competitive and slack business conditions.

This, then, is the record of some of the outstanding events in the controversy between the company and the city and of the negotiations which have led up to the purchase by the city.

As for the future. The idea of Mayor Couzens is that in the street railway the officials in public office in the city will have direct contact with the people through the municipal railway 450,000,000 times a year. Every citizen has something at stake. It is his idea that it is inconceivable that such contact would permit political wasters or plunderers to work. He is on record as saying:

"Municipal ownership is bound to be a success. Anything that is founded on public service will succeed. Our other utilities—light and water—have been successes. There is no reason to believe that street railways should not succeed, too."

There can be no blinking at the fact that Mayor Couzens will set about making municipal operation a success with as much determination as he set about to accomplish municipal ownership. Just how much he and his successors in office will be able to accomplish is something that will be answered only by the lapse of time.

As a subject "Jim" Couzens has been done to death. He is a constant source of copy to the daily newspapers, not much less so than Henry Ford. While his name will, of course, always be coupled with the closing fight in Detroit over the railway matter, still "Jim" Couzens, to ELECTRIC RAILWAY JOURNAL readers, is of interest principally as the vehicle through which the main moves were made in Detroit. It may even seem to some that he has been given too prominent a place in this account. The answer is that you can't very well write about municipal ownership in Detroit without saying a great deal about "Jim" Couzens. It would of course have been possible practically to eliminate Mr. Couzens from the picture, but that would in no way alter the stern reality that Detroit has gone to municipal ownership.

Cleveland Men Accept Cut

Submit to Wage Reduction Rather Than Run Risk of Having Entire Agreement Reopened

Conductors and motormen of the Cleveland (Ohio) Railway have voted to accept a wage reduction of 10 per cent, rather than to submit to arbitration the terms of an entirely new working agreement. The old agreement expired on May 1.

FIVE-CENT PAY REDUCTION

The vote reduces the men's wages from a scale of 55 cents an hour for new men, 58 cents for men with more than six month's service, and 60 cents an hour for men in the company's employ more than a year, to one which provides 50, 53 and 55 cents an hour for the respective classes.

As a result of the vote to accept the new scale, company officials hope to be able to place a 5-cent rate of fare into effect in Cleveland before the end of the year.

Acceptance of the wage reduction was a direct reversal of the stand of the men in a referendum two weeks ago when they voted against a reduction and for arbitration. After they learned that arbitration would probably include the submission of the closed shop clause to the arbiters, the protest of the men caused the officers of the union to decide to offer a second referendum.

At this second referendum the men took the wage cut by vote of 1,186 to 790.

The change in sentiment, it was apparent, was due to the fact that the men preferred to take a cut to arbitration of the question of an open or closed shop and all the other advantages heretofore held under their agreement. Under such a situation their right to organize would have been submitted to outsiders and in the event of an adverse decision on the closed shop question the union would have been left weakened.

CLOSED SHOP AT PRESENT

The present closed shop agreement provides arbitration of all disputes, but the company insisted arbitration of the wage question must include arbitration on all points.

John J. Stanley, president of the company, said:

> This wage reduction should result in an increase of some $30,000 a month in the company's interest fund, which determines what rate of fare shall be charged. We are hopeful that this, together with other economies already in effect, will make possible a return to a 5-cent fare in Cleveland some time during this year.

The new wage scale is retroactive to May 1.

Good Will and Confidence Pledged Georgia Company

The Atlanta Federation of Labor recently pledged to President Arkwright and his company, namely the Georgia Railway & Power Company, its best wishes and friendly aid in any manner that would be useful in furthering the projects proposed by the company. "Two Bells" under date of April 25 reprints the resolutions signed by the legislative committee of the Federation. Some of the high points in the resolution are as follows:

> An impression seems to prevail in the public mind that there is an inherent hostility against the company by labor. This body is big and broad enough to differ specifically with the company and all employers, and agree with them and be helpful as to others. Organized labor never thrived on malice or hatred.
>
> The public should be given to understand that the Federation is fully able to judge when and where the activities of this body is necessary either for or against the company.
>
> We realize that in the contractural relations entered into by the Georgia Railway & Power Company with its organized employees they recognize the right of collective bargaining and the right of organized labor to a voice in the fixing of rates of pay, hours of labor and other conditions of employment. We believe this policy has been a great benefit to the growth and prosperity of Atlanta.
>
> Your committee feels that the Georgia Railway & Power Company possess the confidence and esteem of this body and the good will and encouragement in its undertakings.
>
> This does not imply that as an oganization and as citizens the body is called on to agree with the company in all its projects, but it does mean that we judge each proposition on its merits and by our own understanding, in no wise formed by passion or prejudice or outside influence and opinion.

Finishing Touches Being Put to Grand Rapids Franchise

After many months of negotiations between the city and the Grand Rapids (Mich.) Railway a settlement seems in sight. Speed is necessary, however, in completing the agreement between the company and the city if the proposed franchise is to be submitted to the electors at the primary on Sept. 12 as planned. The city has only recently submitted to the company its draft of the proposed franchise. It is acceptable to the company in almost all provisions, it is announced.

Meetings will be held in the near future to iron out minor details upon which there seems to be some objection by the company. A representative of the employees as well as the one from the company and city attend these meetings.

The franchise, as proposed, will permit the company to charge a 10-cent cash fare, with seven tickets for 50 cents, until January, 1923. At that time a readjustment is proposed. If any surplus is made after the date of the passage of the franchise and before Jan. 1, 1923, over the return on the investment allowed by the city it will be turned into a surplus account to help in fare reduction.

The company has been operating without a franchise for many months. Ever since the franchise expired negotiations have been going on between the company and the city. The changing conditions, however, made it impossible to arrive at a decision as to fares. There was also a long discussion over the valuation of the property and for many months there was a deadlock. This question was finally settled and the city started work drafting the proposed franchise.

Wage Matters Not Finally Settled

Disputed points left over from the arbitration of the Springfield and the Worcester (Mass.) Consolidated Street Railway controversies over wages and working conditions have not yet been definitely settled. After supplemental hearings, James J. Storrow, the neutral arbitrator, advised that the Worcester contract be accepted as governing the various disputed points on both systems. When the men objected, on the ground that the Worcester contract had not been fully observed in practice, it was suggested that the established practice in Worcester be followed there and in Springfield, whereupon a dispute arose over what has actually constituted such practise. For the present the question is in abeyance, pending the company's formulation of a summer program, following which the men propose to give close scrutiny to the manner in which the company applies the rules supposed to follow Worcester procedure. However, the company has agreed to a request that more of the spare men be placed on regular runs, and also to the payment of time and half for overtime of the spare men working under certain conditions.

Proposes Unification of Railway Lines

Representative Richards recently introduced a bill for the consideration of the Massachusetts Legislature which will unify the electric railway lines in the metropolitan Boston district under the control of a Metropolitan Transit Commission. The proposed unification would bring under lease to the Boston Elevated the Hyde Park and West Roxbury divisions and also the Chelsea division of the Eastern Massachusetts Street Railway. The plan is advanced to work out the transportation problem of the Hyde Park and Revere Beach sections, which have confronted the trustees of the Elevated and the Eastern Massachusetts Street Railway for some time. Representative Richards has announced that there would be a single fare within the metropolitan transit district.

Mayor Curley is opposed to the bill, as, also, are the trustees of the Eastern Massachusetts Street Railway. The trustees claim the terms of the bill would dismember the properties of the company and would result in unfairness to riders and stockholders. Under the proposed bill the stockholders would have no voice in the matter.

Strike Ties Up Line

The lines of the Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio, are tied up by a strike of the trainmen. The company was prepared to resume service, but the first attempt to do so in East Liverpool resulted in a demonstration so hostile to the company that the effort to operate was discontinued at the request of Mayor Wilson. Workers imported from Cleveland and Toledo to replace the strikers were set upon by rioters and beaten up. The controversy appears to have arisen over the refusal of the company to deal with any but its own employees as individuals, but efforts made by the ELECTRIC RAILWAY JOURNAL to secure a statement for publication from official sources have proved unavailing. The contract between the company and its men expired on May 1.

Film Shows Commission's Relief Plan

Movie fans who flocked to the New York City Town Hall on Friday night, May 5, didn't see William S. Hart engage in any Wild West duel nor Douglas Fairbanks jump from one roof to another but saw a "reel" feat—Mr. S. Trapp Hanger traveling on the Interborough Transit Company during morning rush hours in an effort to reach his office. He was jarred, jostled and jammed so in the shuttle train operating between the east and west side of the city Forty-second Street that he beseeched Father Knickerbocker to come to the rescue. "Standing Room Only," the commission's motion picture, portrayed New York City's past, present and future transportation problems and developments. The solution to the present transportation problem was shown to be in the commission's plan which stood for New Construction, Consolidation, Reorganization, Honest Values and Public Ownership.

An informal debate was part of the program at the Town Hall, the participants being Murray Hulbert, president of the Board of Aldermen, Major-General O'Ryan, one of the commissioners, and Daniel L. Turner, chief engineer of the commission.

Mayor Addresses Railway Men

In a brief address before 300 officials and employees of the Connecticut Company at Hartford, on May 11, Mayor Richard J. Kinsella, said that he intended to confer in the near future with Lucius S. Storrs, president of the Connecticut Company, with respect to the local railway situation. Mr. Kinsella was elected on a platform calling for lower fares.

Nathaniel J. Scott reviewed his first year as manager of the Hartford division of the Connecticut Company.

Ralph Martin, traffic manager for the company, gave some interesting figures and data on the traffic checking system.

F. P. McKaig and H. Jackson Tippett, officials in the track and pavement construction department, outlined the work of this department.

Leslie Spraggon of the mechanical department stressed the need of shop efficiency.

Mr. Storrs said: "We must pull together to sell service to the public."

Joseph Berry, special counsel for the company, created great hilarity by a humorous recital of a typical busy day of J. K. Punderford, vice-president and general manager of the company.

News Notes

New Contract Made.—The Empire State Railroad Corporation, Syracuse, N. Y., has completed a new contract with its interurban men, shopmen, etc., which calls for a reduction varying from 2 cents an hour for trainmen to 5 per cent in various other departments. With the exception of wage rates and certain changes in overtime provisions, the new contract is the same as that for last year.

Mayor Opposed to Transit Plans.—Mayor Hylan of New York City has expressed his opposition to the plan of the Transit Commission to construct seven subways at a cost of $218,000,000. He announced that the city would soon make public a plan of its own for new construction. The Mayor is very much against private operation and said that the city would appropriate money for new subway lines only on the basis of city ownership and city operation.

Denies Electrification Reports.—Reports from the East that the Great Northern Railway is preparing for electrification of part of its Western lines were denied recently by President Ralph Budd. The Great Northern has been studying electrification for several years and officials have in mind, it is understood, the starting of electric trains through the Rocky Mountain district as the next major development. President Budd said that the Great Northern has no plans for electrification in the immediate future.

Lease Approved.—The Public Service Commission has approved the lease for the operation of the Frankford "L" by the Philadelphia (Pa.) Rapid Transit Company. This decision brings to an end negotiations which have been under way for a period of five years. The commission has reserved for itself the right to determine a reasonable rate of fare to be charged patrons of the line and also the character of the service. W. D. B. Ainey, chairman of the commission, announced that the fare question would be considered ultimately upon the basis of the pending valuation proceedings.

New Franchise in Galesburg.—A new railway franchise at Galesburg, Ill., between the city and the Galesburg Railway, Lighting & Power Company, was passed and accepted under date of March 14, 1922. It runs for twenty years, which is the limit in the State of Illinois. The grant provides for the operation of one-man cars. Service is not to be less than twenty minutes on any line and the company is not to be held for any paving which the city may do, excepting that its tracks when laid will be laid on a base to conform with base used by the city when street is paved. No compensation is to be paid the city other than regular taxes.

Financial and Corporate

Holders Urged to Accept

Protective Committee Sees This as Only Safe Way Out of Interborough Tangle

The protective committee representing the holders of the 4½ per cent collateral trust bonds of the Interborough-Metropolitan Company, New York, N. Y., has addressed a communication to holders of the bonds and of certificates of deposit, and also to holders of Interborough Rapid Transit Company stock urging upon them the conclusion that the best chance—perhaps the only chance—of saving the equity represented by Interborough stock, constituting principal security of Interborough-Metropolitan bonds, is the adoption of proposed Interborough-Manhattan plan of voluntary readjustment.

In pointing out that the plan effects a reduction of Manhattan dividend rental, reduces fixed charges on Interborough-Manhattan properties, accomplishes an extension or renewal of Interborough Rapid Transit 8 per cent gold notes aggregating $38,144,000, maturing Sept. 1, next, and provides for capital requirements of approximately $15,000,000, the committee states that unless some such plan is consummated, receivership is inevitable. Security holders are told that by fiscal year commencing July 1, 1925, earnings are estimated by officers of Interborough company to be at least sufficient to provide 4 per cent on Interborough stock. In addition, attention is called to the distinct value possessed by Interborough stock as a result of so-called "terminal payments" to which it will be entitled after retirement of first and refunding mortgage bonds. Following retirement, provided for through a sinking fund, entire earnings of city-owned subway system will accrue to system for eleven years intervening before expiration of operating contract with the city. Company preferential payments during this period would amount to $122,485,000, in addition to payments of $31,000,000 by the city for Interborough equipment.

The plan gives to holders of Interborough-Metropolitan 4½ per cent bonds and Interborough Rapid Transit Company stock the option.

(a) of purchasing, at their principal amount and accrued interest, new Interborough ten-year 6 per cent gold notes to the extent of 16 per cent of the principal amount of their bonds, or 32 per cent of the par value of their Interborough stock, respectively, and keeping all their bonds or stock, as the case may be; or

(b) of surrendering 60 per cent of their bonds or stock to an underwriting syndicate which has been formed to purchase such of the new notes as are not taken by said bondholders and stockholders (the notes purchased by said bondholders and stockholders and the surrendered bonds and stock, however, to be offered for subscription by holders of preferred and common stock of Interborough Consolidated Corporation).

The committee advises bondholders and stockholders to subscribe for their pro rata share of the new notes, thereby avoiding any sacrifice of their interest in the Interborough stock.

Since the preparation of the plan G. M. P. Murphy & Company, J. & W. Seligman & Company, Kidder, Peabody & Company and Guaranty Company, New York, as syndicate managers, have formed a syndicate which, for a cash commission to be paid by the Interborough Company, will underwrite the purchase as above provided.

The trust agreement under which Interborough stock is pledged to secure Interborough-Metropolitan 4½ per cent bonds is to be foreclosed and bondholders not assenting to the plan will receive only their pro rata share of the cash proceeds of such sale and of the sale of other unmortgaged assets of the Interborough Consolidated Corporation.

Will Contract for Safety Cars

Justice George E. Pierce in the Supreme Court at Buffalo has signed an order directing George Bullock, as receiver for the Buffalo & Lake Erie Traction Company, the Erie Electric Motor Company, the Erie City Passenger Railway, the Erie, Reed Park & Lake Side Street Railway and the Buffalo & Lackawanna Traction Company, to contract with the J. G. Brill Company, Philadelphia, for leasing on car trust agreements twenty-five one-man safety cars for operation by the Erie & Suburban Railway in the city of Erie, Pa. Mr. Bullock also controls this line by reason that all its capital stock is held by him as receiver for the other affiliated traction interests.

The agreement for the leasing of the cars and payment provides that the cars are to be single-truck, double-end, equipped with Birney safety motor car bodies complete with G.E. 264-A motor equipment, K-63 double-end control, G.E. air brakes, C.P.-25 compressors and Brill patented No. 79 E-I trucks.

The base rental to be paid is $159,492, at the rate of $6,379 per car, payable as follows; 25 per cent cash on shipment, the balance sight draft attached to bill of lading. The balance to be paid in sixty notes or lease warrants of the railway maturing monthly over a period of sixty months, with 6 per cent interest. The company must keep the property insured and the title vests in the Brill Company until payments have been completed.

$12,500,000 Issue Offered

Holding Company to Use Proceeds of Long-Term Issue to Retire Short-Term Paper

A contract has just been made by the Commonwealth Power, Railway & Light Company, New York, N. Y., which contemplates the sale of an issue of $12,500,000 twenty-five-year 6 per cent secured sinking fund gold bonds, the proceeds of which will be applied to the payment of banking indebtedness due Nov. 1, 1922, and convertible bonds due May 1, 1923. This provides for all indebtedness of the company except the serial notes maturing May 1, 1923-1924, and June 1, 1923-1924, amounting to $1,696,000, and other items aggregating $454,609, and outstanding scrip issued in lieu of cash dividends, maturing on Feb. 1, 1924, 1925, 1926 and 1927, amounting to $3,490,465.

In arranging this financing it was found desirable to group into one company the ownership of all the controlled companies engaged in the electric light, power and gas business, and to this end the Commonwealth Power Corporation has been organized to acquire the common stock of the Consumers Power Company, Central Illinois Light Company, Illinois Power Company, Southern Indiana Gas & Electric Company and the Springfield Light, Heat & Power Company, together with $5,318,500 of the preferred stocks of some of these companies, all of which stocks have been pledged as collateral to the $12,500,000 twenty-five-year bonds to be sold. All of the preferred and the common stock of Commonwealth Power Corporation come into the treasury of the Commonwealth Power, Railway & Light Company, either directly or through its subsidiary the Union Railway, Gas & Electric Company; so that the equity ownership of the Commonwealth Power, Railway & Light Company remains unimpaired.

George E. Hardy, president of the company, says that within a short time it is planned to submit to the stockholders of the company a plan for the conversion of their preferred stock and scrip into preferred stock of the Commonwealth Power Corporation. The details of this plan are now being considered, but it is understood that it will carry assurance that payment of dividends upon the preferred stock of the new company can be started.

As the plan now under contemplation provides for the retirement of a large amount of short-term indebtedness by the issuance of long-term obligations, it is expected that the value of the investment of the company in its subsidiaries will be materially improved. This, of course, should inure to the benefit of both the preferred and the common stocks of the Commonwealth Power, Railway & Light Company, so it is explained.

The new issue of $12,500,000 of Commonwealth Power Corporation 6 per cent bonds is being offered for subscription at 90 and interest to yield more than 6.80 per cent.

Details Being Arranged

Securities Deposited in Furtherance of Reorganization Agreement for American Cities Company

There have been thus far deposited with the National Power & Light Company, $555,900 of the securities of the American Cities Company for which new securities are to be issued by the holding company. The securities being deposited are the 5-6 per cent bonds of the American Cities Company.

Meanwhile the National Power & Light Company plans to apply to the New Orleans Stock Exchange to list $8,655,000 of its securities, which are to be exchanged for the 5-6 per cent bonds of the American Cities Company.

The Interstate Trust & Banking Company, New Orleans, has been named agent for the Central Union Trust Company, New York, trustee of the mortgage covering the new securities of the National Power & Light Company and the Hibernia Bank & Trust Company, New Orleans, has been made transfer agent for the preferred and common stock with the Canal-Commercial Trust & Savings Bank, New Orleans, as registrar.

J. K. Newman, chairman of the committee of five, representing the holders of the 5-6 per cent collateral trust bonds of the American Cities Company, under the bondholders' deposit agreement of Jan. 15, 1919, has issued a statement of date of May 1, 1922, to the depositors of the American Cities Company of the above securities, explaining the plan of the bondholders' committee for the reorganization of the American Cities Company and giving a brief statement of the new company and its subsidiaries, the Memphis Gas & Electric Company, the Memphis Street Railway, the Birmingham Railway & Light Company, the Little Rock Railway & Electric Company, the Knoxville Railway & Light Company and the Houston Railway & Light Company. The statement is issued from the office of Isidore Newman & Sons, 212 Carondelet Street, New Orleans.

C. C. Chappelle, representing the Chase National Bank, New York, reached New Orleans May 10 and was a visitor at the City Hall, where he conferred with Commissioner of Public Utilities Paul Maloney on matters affecting the reorganization of the New Orleans Railway & Light Company. It is more than likely that until this matter has been definitely settled Mr. Chappelle will be a frequent visitor to New Orleans.

Seeks to Finance Construction of Ferryboats

Plans for financing the construction of two steel hull electrically driven ferryboats of 3,000-passenger capacity were submitted recently to the Railroad Commission by the San Francisco-Oakland Terminal Railways. The company asks permission to appropriate $300,000 from its depreciation fund and to issue $600,000 face value of 7 per cent serial equipment trust notes to be secured by a pledge of the boats. Permission is further requested to set aside $5,000 a month out of the depreciation fund for a sinking redemption fund for the equipment trust notes. The company agrees that when the reorganization plan now under way is perfected it will reimburse the depreciation fund from the sale of first mortgage bonds. The new ferryboats are to take the place of the steamer *San Jose*, destroyed by fire on March 23, 1919, and one of the boats now in service. The business is declared to be rapidly increasing and the employment of additional ferryboats of larger carrying capacity is said to be necessary.

Petitions for Abandonment

Sault Ste. Marie, Mich., a city of 15,000 inhabitants at the site of the famous "Soo Canal," St. Mary's River, connecting Lake Superior and Lake Huron, is experiencing street railway difficulties that have found their way before the Public Utilities Commission.

Since the advent of the gasoline motor vehicle, electric railway lines at Sault Ste. Marie, one a three-mile single track system from the country club, on the east side of the city, to the suburb of Algonquin, on the west side, and a loop about the city, have steadily lost money. The climax came when the city commission called on the Sault Ste. Marie Traction Company to pay approximately $8,000 for paving between and on either side of the tracks, on the "loop system," where streets have been dug for laying a trunk sewer.

This, the company explained, it was unable to do, and cited losses of $16,000 since Jan. 1, 1921. The city was insistent, however, and the company carried to the state utilities body a petition for authority to cease operations. The state commission heard the plea, then issued an order that "unless the city charter is amended so as to permit the company to escape its share of paving costs, the company will cease operations on July 15."

The city attorney has ruled that a special election to decide such a question is not permissible, but that a special election to vote on the "daylight saving plan" may be called, and the charter amendment made a separate issue of the same election. This will probably be done.

There is an element of the population at Sault Ste. Marie which believes the day of the electric street railway in cities of less than 50,000, has passed and that a flexible motor bus service is the only solution. They are divided, however, on the question of public or private ownership of such system, and these questions will probably enter largely into the election.

The company announces that it will cease operations July 15, unless the electorate votes to amend the charter and themselves assume the burden of paving.

Tax Exemption Vote Soon

Believed That New Measure Will Come Up Soon in House of Representatives for Consideration

Despite efforts to delay the consideration of tax-exempt security legislation, the joint resolution recently approved by the ways and means committee will be brought to a vote in the House of Representatives in the near future. It is believed that the resolution will pass, but a hard fight is in prospect.

The principal arguments being advanced against the legislation are that it will make it much more difficult for states and cities to sell their securities and that it will increase the rate of interest that farmers will have to pay for loans.

Some members of the House who oppose the resolution go so far as to say that a constitutional amendment such as is proposed will reduce materially state participation in such matters as federal aid highways and practically will preclude municipal operation of public utilities.

On the other hand, those favoring the legislation contend that the issuance of tax-exempt securities establishes a privileged class which enjoys all the benefits of public expenditures but which pays no share of them.

At the close of 1921 there were at least $15,000,000,000 of tax-exempt securities in existence. In 1921 alone the amount was increased by more than $1,000,000,000. While the rate of increase in 1922 may not be as great as in recent years, it is declared to be obvious that these securities will be issued in constantly increasing quantities.

ADVOCATES CLAIM PRIVATELY-OWNED UTILITIES SUFFER MOST

While industry as a whole suffers because it is denied the use of large sums which can be invested more profitably in tax-free securities, the privately owned public utilities suffer most, friends of the resolution point out, because they cannot compete with publicly owned undertakings whose bonds are tax exempt.

A majority of the committee on ways and means voted to recommend the legislation and gave eight reasons why the issuance of tax-exempt securities should be condemned. As the committee sees it tax exemption does all of the following things:

1. Causes a great loss of revenue by permitting a large portion of property to escape taxation.
2. Violates the ability principle of taxation and discriminates unfairly between taxpayers.
3. Impedes private financing.
4. Discourages investment in new enterprises.
5. Encourages extravagances of governmental agencies.
6. Grants a private subsidy to certain interests.
7. Increases the rate of interest required for all enterprises not carried on by the government and thereby adds to the cost of living, because under it money is withdrawn from private enterprise.
8. Creates social unrest.

Digitized by Google

Another Offer Made to Become Company Stockholders

All employees of the Public Service Railway, Newark, N. J., who want to take advantage of another opportunity to get in on the "customer-ownership" plan can make application to their respective department heads. "All Together," the official publication of the railway at Camden, says that the Public Service Corporation, which operates the railway, gas and electric properties, has gained so many thousand customers as partners through the plan that it is making a brand new offer to help employees to become part owners on an easy payment plan. No initial payment on the stock will be required and a flat amount of only 75 cents per share a week or $3 per share a month will be deducted from the pay envelopes so that the stock will be paid for in two and one-half years. Eight per cent interest will be allowed on payments and the interest will be compounded quarterly.

Consolidation of Utilities at Columbus

Comprehensive plans for the consolidation of electric railway and gas utilities at Columbus, Ga., under the management of Stone & Webster, Inc., have been approved by stockholders of the Columbus Railroad, and if sanctioned by the Railroad Commission of Georgia will be put into effect in the near future. The Columbus Electric Company owns all the common stock of the Columbus Power Company, Columbus Railroad and of the Gas Light Company of Columbus. Recent legislation in Georgia has given to the railroad company, long engaged in the electric railway and retail electric light and power businesses, the right also to generate and furnish gas to consumers. It has long been apparent that it would be desirable to consolidate the subsidiary companies of the Columbus Electric Company in order that a flexible financial structure might be set up adequately to care for the expected growth of business, and such as to give the stockholders of the Columbus Electric Company direct ownership in the physical properties. The laws of the State confer the right to consolidate the power and the railroad companies, the market is regarded as favorable for long-term or permanent financing, and the time is looked upon as advantageous for financing $1,750,000 of 6 per cent coupon notes of the electric company, due July 1, 1922.

The plan contemplates the changing of the name of the Columbus Railroad to the Columbus Electric & Power Company and

(a) Acquisition by the new company of the properties of the Columbus Power Company, subject to $3,667,000 outstanding first mortgage bonds due in 1936, and assuming payment thereof.

(b) Acquisition by the new company of the properties of the Gas Light Company of Columbus.

(c) Issuing by the new company of first mortgage bonds and 7 per cent cumulative first preferred stock to cover the indebtedness of the Columbus Electric Company, including the 1,750,000 coupon notes maturing July 1, 1922; $758,000 collateral trust 5s to be called at 105 (requiring $795,900), floating indebtedness of $240,000, and $50,000 consolidation expenses estimated. Provision may be made, if found feasible by the directors of the new company, for converting the above preferred stock at the option of the holders into common stock.

(d) Issuing the new company's 7 per cent cumulative second preferred stock to be exchanged share for share for the outstanding 6 per cent cumulative preferred stock of the Columbus Electric Company and $228,700 of 6 per cent preferred stock of the Columbus Power Company, this being all of the latter's preferred stock not held by the Columbus Electric Company.

(e) Providing for an issuance aggregating $1,500,000 of common stock by the new company, to be distributed share for share for the present common stock of the Columbus Electric Company.

All notes and open accounts held by the Columbus Electric Company against its subsidiaries will be canceled.

The initial capitalization of the Columbus Electric & Power Company will total $10,095,700, of which $5,167,000 will be in bonds and the balance in stock. A considerable amount of duplication of corporate administration will be eliminated by the consolidation. Gross earnings of the combined properties for the twelve months ended Jan. 31 were $1,824,787.

Financial News Notes

Annual Meetings Held.—Annual meetings of the officers, directors and stockholders of the Michigan Railway and the Michigan United Railways were held recently at the general offices of the railway lines in Jackson. The old officers and directors of each company were re-elected.

Nine Months Income $116,043.—For the nine months ended March 31, 1922, the report of the New York Railways shows a net income of $116,043, compared with a deficit for the corresponding period a year ago of $380,360. Though the operating revenue was some $52,000 less than in the nine months ended March, 1921, the operating expenses decreased from $6,824,930 to $6,214,134 for the nine months ended March of this year.

Under Control of New Interests.—Day & Zimmermann, Inc., recently announced that through the purchase from Brown Brothers & Company of the controlling interest in the common stock of the York (Pa.) Railways the affairs and operation of the company will be brought under their supervision. No financing is contemplated at present. It is said that the deal involved 27,000 shares of stock held previously by Brown Brothers & Company.

Lake Shore Property Reports.—The Lake Shore Electric Railway, Cleveland, Ohio, reports gross earnings for 1921 of $2,080,980, against $2,699,342 for 1920. Operating expenses and taxes decreased from $2,037,417 in 1920 to $1,682,184 in 1921. The net surplus, however, fell considerably below that of 1920, the 1920 figure being $327,035 and the 1921 surplus being only $65,400. The number of passengers carried decreased from 7,687,946 in 1920 to 6,802,291 in 1921.

Wants to Issue Securities.—To finance needed improvements and extensions of its lines in Gary, Ind., the Gary Street Railway has filed a petition with the Indiana Public Service Commission asking for authority to issue additional securities. The company plans to issue a total of $130,000 of twenty-year 5 per cent first mortgage gold bonds. It is believed the improvements will cost not to exceed $103,000, but the larger bond issue is asked to care for the expense of selling the bonds at a discount which will make them yield 7 per cent to the purchasers.

Four Months Report Made.—For the four months ended April 30, 1922, the Philadelphia (Pa.) Rapid Transit Company reports a net income of $806,343, against $540,110 for the same period in 1921. The total passenger revenue for the period from January to April, 1922, inclusive, amounted to $13,486,680, a decrease of $431,508 over the same period in 1921. The total number of passengers showed a decrease of more than 6,000,000. In the 1921 period the number of passengers carried was 279,758,158, compared with 273,717,648 for the same period this year.

Purchase Announced.—Purchase of the city lighting and power plant of the Ohio Electric Railway, in Lima, Ohio, by the American Gas & Electric Company for a consideration said to be $1,000,000 was announced in Lima, on May 10, by the receiver of the Ohio Electric Railway, B. J. Jones. The deal was engineered by Drexel & Company, Philadelphia, acting for the bondholders. Reports are current in Lima that the American Gas & Electric Company also contemplates the purchase of the Lima city street car lines, which are at present operated by the Ohio Electric Company. The Lima plant has been supplying power for the city lines in Lima as well as furnishing city consumers with electricity for light and power.

Would Have Commission Value Line.—Contending that an appraisement by the owners of $26,500 is exorbitant, the Commission Council of Green Bay, Wis., has petitioned the Wisconsin Railroad Commission to have commission figures placed on the Bay Beach extension electric railway line. Two miles of track, an indeterminate franchise and some equipment comprise the total of the line's holdings. The city operates an amusement resort at the beach end of the line and last year leased from the owners and bought power. One mile of trackage is within the city limits and the Council contemplates devising some plan whereby the city can buy outright and either operate the line as a municipal project or release it to the Wisconsin Public Service Company. The line is owned by A. W. Priest, Appleton, Wis.

Traffic and Transportation

City Action Held Invalid

Shreveport Railways Compelled to Return to Five-Cent Fare on Legal Technicality

The Shreveport (La.) Railways has returned to a 5-cent fare. This is the result of a decision in the case of Long vs. the city of Shreveport in which a rehearing was denied from the ruling of the State Supreme Court, holding that the 6-cent fare measure had not been legally enacted. There was no denial by the court, however, of the right of the city to authorize an increase and readoption under a readvertisement. This the Council is proceeding to do.

It appears that back in 1920 the City Commission adopted an ordinance granting the Shreveport Railways the right to charge a 6-cent fare. The matter was presented to the public for a vote and the increase was passed upon favorably by the citizens. Having failed in his efforts to defeat the proposition at the election Mr. Long filed suit to annul the election, alleging that the proceedings of the Mayor and Council in calling the vote were not in accordance with the procedure prescribed for such action.

The District Judge sustained Mr. Long's contention. The railway appealed the case, agreeing to give rebate slips good for the extra cent in the event that the case finally went against it. This it has since been doing.

In the case of Long against the Shreveport Railways the court on final decree reversed the judgment of the lower court. That ruling was in favor of the plaintiff in so far as it annulled the election by the people, holding the election valid and all steps leading up to the election legal and binding, but the court did decree that the subsequent action of the Council in putting on passage the final ordinance carrying the election into effect was irregular for want of technical compliance with the charter of the city giving to Council the right to put the ordinance on passage to carry the will of the people into effect. The decree reads as follows:

> For the reasons assigned, it is ordered adjudged and decreed that the judgment appealed from be annulled and set aside in so far as it annuls said election, which is hereby decreed to be valid. In all other respects said judgment is affirmed save and except that the Mayor and City Council of Shreveport be permitted, if they see proper, to give said required notice and to proceed on the authority granted in said election as if they had not as yet finally passed said ordinance. It is further ordered that the appellee pay the costs of this appeal.

The rehearing upon this decree was refused on April 24. The Council is now proceeding to put the ordinance on final passage.

The Attorney General of the State of Louisiana has since filed with the District Court of Shreveport a petition asking that the Mayor and the Commission Council be restrained from adopting the ordinance putting into effect the 6-cent fare, claiming that the State Public Service Commission has jurisdiction over the question. The District Judge has heard arguments on both sides of the question and has taken the matter under advisement.

The question to be decided is whether the city of Shreveport had legal authority to grant franchises and exercise supervision and control over its public utilities prior to the adoption of the new constitution on July 1, 1921.

It is contended by the State's Attorney that without expressed specific authority granted by the State Legislature the city was without authority. That official says he can find no such authority granted to the city of Shreveport.

One-Man Cars Approved for Meriden

"It is the judgment of the commission that the one-man Birney safety car affords a higher degree of safety than the present heavier two-man car, which is unequipped with similar automatic safety device," says a decision of the Public Utilities Commission of Connecticut in denying a protest by city officials of Meriden against the contemplated use by the Connecticut Company of one-man cars on the Colony Street and East Main Street lines of the company in that city.

Mayor H. T. King protested that it would be dangerous to permit the use of the cars due to the fact that on East Main Street there is a long steep hill just a short distance from a grade crossing on the main line of the "New Haven" road.

The company claimed that one-man cars would be safer than the present two-man cars as the Birney cars are equipped with the latest safety devices. In addition the cost of operation would be materially lessened. During 1921 there was a loss of about $40,000 in Meriden and the receipts of the division thus far in 1922 have been running about 17 per cent less than in 1921.

The commission said that it was difficult to perceive of what particular usefulness an extra man would be on a car of which the motorman had lost control and that the safety devices with which the cars are equipped afford passengers every protection that human ingenuity could devise. With reference to the element of danger at the crossings of the steam railroad the commission pointed out that crossings are protected by gatemen who are present for twenty-four hours each day and that as a precaution against a car becoming stalled when on the railroad tracks, the company has provided at these crossings an electrified net with which the trolley pole would come in contact.

Increased Fares Authorized—Economies Being Effected

Permission to increase fares in the city of Springfield, Ohio, from 5 to 7 cents, with stops at every other street intersection within the corporate limits, has been granted to the Springfield & Washington Railway, South Charleston, Ohio, by the City Commission. The action was taken by the commission on application of the company which was recently reorganized. The company's application was given the support of the Springfield Chamber of Commerce and City Manager Edgar E. Parsons. Previously, the company's franchise had called for a 5-cent fare with stops at all street intersections.

The application is in line with the plans of the new owner of the traction line to place it on a paying basis. Prior to the reorganization, application had been filed with the State Utilities Commission for authority to abandon service. The company, however, was purchased by George D. Baker of Washington Courthouse, who withdrew the application to abandon and announced his intention of attempting to make the project pay.

Another move toward economy was the removal of the station from the center of the city, where the rental was more or less excessive, to a cheaper location. Bus routes were also established to serve as "feeders" and an agreement was reached with the Flag bus line of Washington Courthouse, whereby bus service to Springfield was discontinued. Under the agreement the buses now operate to South Charleston, where passengers for Springfield are transferred to the traction line.

Eight-Cent Fare Extended

The Public Service Commission of Missouri has issued an order extending for six months from May 18, the 8-cent fare charge by the Kansas City Railways. The company had displayed to the commission its earnings and estimated earnings, which showed about a million and a half excess over operating expenses but a deficit considering fixed charges, of about $293,000. The city representatives consented to an extension of six months for the 8-cent fare, but objected to a longer extension because of the possibility that costs of coal and operating expenses might decline by the time that the extension for six months had expired.

The commission approved advertising as a legitimate expense of utility operation, and explicitly instructed the company to use publicity methods for exploiting the sale of tickets and tokens at rates lower than 8 cents—tokens at two for 15 cents on cars, and tickets at five for 35 cents at many local points, where also books of 25 tickets are sold for $1.75.

More Fare Modifications

Connecticut Experiments to Continue—Commission Recommends Use of Buses

"The commission does not at this time deem it good public policy or warranted by the facts presented to make any general change in the rates outside of the test areas, but will retain jurisdiction over all pending cases for future determination." This is a statement contained in a letter sent on May 11 by the Connecticut Public Utilities Commission to president Lucius S. Storrs of the Connecticut Company.

"We feel, however," the letter states, "that a continuation of the tests with some modifications in both Norwalk and Bridgeport is justified and desirable in view of the results already shown."

The commission points out that petitions affecting rates are pending from Norwalk, Bridgeport, New Haven, Waterbury, New Britain and Hartford. In Norwalk and Bridgeport the present rates were put in under temporary order of the commission directing test periods subject to change as the commission may deem advisable.

Suggestion is made by way of further experiment in Norwalk until July 1 that 5-cent fares without transfer be established on all lines in that city. Weekly reports on this scheme are desired by the commission.

The commission also suggests installation of buses on lines not now paying which would cut the costs of operation.

The commission said in part:

The year 1920 resulted in an operating deficit for your company of $1,400,000, while the year 1921, which was the first period the 10-cent fare was in effect throughout an entire year, showed an income, after payment of operating expenses and of current taxes, but before payment of any return on the value of the property, of substantially $750,000. It is estimated that if the present rates of fare remain in effect, the income for 1922 after payment of operating costs but before payment of current taxes or any return on the value of the property, will be about $1,300,000.

The higher rates instituted by authority of the commission have resulted in increasing the company's revenue, but not sufficiently to allow a fair return on the value of the property as determined by the commission. It would be unfortunate so to readjust or reduce the rates of fare at this time as to put the company back in its previous condition, and at this writing conditions do not justify any extended experiment with rates of fare in new territory, especially as the State is now deriving benefit by reason of the payment of back taxes.

The commission does not at this time deem it good public policy or warranted by the facts presented, to make any general change in the rates outside of the test areas, but will retain jurisdiction over all pending cases for future determination. We feel, however, that a continuation of the tests, with some modifications in both Norwalk and Bridgeport, is justified and desirable in view of results already shown.

Norwalk, for a long term of years, has not been a paying division. In November, 1921, by order of the commission, there was established as an experiment or test, a short 5-cent zone on West Avenue, the result of which has shown a financial improvement over previous operations. All the lines in Norwalk are short and readily lend themselves to a short 5-cent zone system, although it is probable that the Dorland's Point line can never be successfully operated as a street railway line. The establishment of a 5-cent zone system, without transfer in Norwalk, would undoubtedly increase the riding and afford acceptable service to the great majority of the traveling public, although for a limited number going through more than two zones the rates would be increased. It is impossible, however, to make any equitable modification without creating a possible hardship upon a few, but the greatest good to the greatest number to a certain extent must have its influence.

The commission suggests by way of further experiment in Norwalk until July 1, 1922, and until further direction by the commission, that 5-cent fares, without transfer, be established on each of the lines in Norwalk.

If this suggestion is adopted by your company, the commission would desire weekly reports of the revenue received on each line, and as far as practicable a statement of revenues on the same lines during the preceding test period, and the period of last year, corresponding to the period of this experiment. The results shown by such an experiment should be of value in determining the advisibility of establishing shorter 5-cent zones on other lines of your system where it would be practicable.

At the hearing in Bridgeport in March, the Mayor of that city suggested that the present rates of fare be continued, but modified, to allow the present 10-cent fare riders the option of using tokens now enjoyed by the 10-cent fare riders throughout other parts of the State. The commission is of opinion that this is a reasonable suggestion and would recommend its adoption until July 1 and until further modification of the test rate. As in the case of Norwalk, the commission would desire your company to continue the submission of weekly reports.

As you are aware, there are certain lines on your system which are not now paying and never have paid expenses. The installation of buses on such lines would lessen the cost of operation and permit an extension of service to sections not now being served, and possibly produce additional revenue.

The commission would appreciae an acknowledgment of this communication with a statement of the company's attitude with reference thereto, particularly as to the adoption of the suggestions made herein.

Another City on Weekly Pass Plan

The $1 weekly pass plan was put into effect in Meadville, Pa., on May 1 on the lines of the Crawford County Railways operated under lease by the Northwestern Pennsylvania Railway. The returns from sales for the first week were 10 per cent over the receipts for the previous week. The tickets are sold in stores and banks as well as in the cars and office of the railway. There is no change in the ticket and cash rate, namely 10 cents cash, with six tickets for 50 cents. The weekly pass plan for Meadville was referred to in the ELECTRIC RAILWAY JOURNAL, issue of April 22.

City May Lower Fare by Enacting Ordinance

In an address before the Denver Bar Association on the regulation of public utility rates recently H. Robertson, attorney for the Denver (Col.) Tramway, said that the City Council may at any time enact an ordinance regulating the fare at a lower figure than 8 cents authorized by the decision of former Federal Judge Robert E. Lewis. He pointed out that if the Council and the city enact a fare that in the opinion of the tramway is confiscatory, the tramway will, as it has in the past, go into the courts and attempt to have the fare declared confiscatory. The burden of proving that a fare is confiscatory, Mr. Robertson said, always rests upon the tramway.

Mr. Robertson said the tramway's position in the recent fare litigation was that the city of Denver did not have the power to contract with a public utility with regard to rates and that the city could not enforce the 5-cent fare ordinance as a contract. A contract, he said, the courts would enforce regardless of whether the rates were confiscatory, but when the power of the city over rates is merely regulatory, he said, the courts are the final authority.

Transportation News Notes

Seven-Cent Fare to Continue.—Patrons of local lines of the Ohio Electric Railway will continue to pay a 7-cent fare for at least six months. The original grant of increased fare made two years ago was extended the fourth time by City Commissioner. Negotiations are under way for the sale of the property to eastern interests.

Six-Cent Fare Reduction.—The Gary (Ind.) Street Railway has received the permission of the Public Service Commission to reduce the fares from all parts of Gary to the Cudahy Chemical plant on Cline Avenue and the L. C. L. railroad yards on West Ninth Street. The present fare to the Cudahy plant and to the L. C. L. yards is 16 cents. The reduced fare will be 10 cents under a fifty-ride ticket plan, tickets will be good for ninety days.

Will Place Traffic Markers.—The Houston (Tex.) Electric Company will soon place iron cone-shaped traffic markers to designate the safety zones on all street corners in the downtown section of the city where street cars stop to discharge or take on passengers. Wooden platforms are now in use, but it has been found that these platforms are inadequate. The City Council has just approved a request from the company for authority to purchase 150 such traffic markers at a cost of $10 each.

Automobile Interference: The Cause.—From April 16 to 30, inclusive, there were 111 accidents on the Pacific Electric lines within the city limits of Los Angeles, according to a report filed on May 10 with the City Clerk by S. A. Bishop, general claim agent of the Pacific Electric Railway. The report showed that eighty-eight of these accidents were caused by collisions between street cars and automobiles, while most of the remaining accidents were attributable to women falling from street cars.

Temporary Lower Rates Asked.—With a view to stimulating traffic between Gary and Valparaiso, Ind., and between Valparaiso and the lakes surrounding it, the Gary and Valparaiso Interurban Railroad has filed an application with the Indiana Public Service Commission for permission to put in a lower schedule of rates beginning on Memorial Day and extending to Labor Day. The new rates will make the fare between the two cities 3 cents cheaper than the fare over the Pennsylvania Railroad for the same haul.

Personal Mention

L. T. Peck Retires as President

Continues With the Honolulu Rapid Transit & Land Company as Its Board Chairman

Announcement was recently made in far Hawaii by the Honolulu Rapid Transit & Land Company of the retirement after twenty-one years of valued service of L. T. Peck as president and his appointment as chairman of the board, with continuing oversight of the financial affairs of the company.

Mr. Peck was born in Brooklyn, N. Y., in 1860. He attended public and private schools there and in Milwaukee, where he was graduated from the high school. His first executive position was that of manager for eleven years of the company which established the Ohio Valley town of Kenova, in West Virginia, to which he gave its unique tri-state name.

As an outcome of a pleasure trip to the Hawaiian Islands in 1900, he became interested in the plans of the newly formed traction system in Honolulu. He returned there shortly from West Virginia, and was appointed treasurer of the company and chairman of the executive committee of its directorate. In 1904 he became its president.

MODERNIZES SYSTEM

From 1890 Honolulu had been served by an English tram company using antiquated mule-drawn cars upon 12 miles of lightly constructed single track. The fares varied from 5 to 15 cents, the main route being about 15 miles in length.

In 1903 the transit company bought out and scrapped the tram lines, substituting its own, which consist of more than 30 miles of track very substantially built and equipped and well-maintained.

Service has always been provided (with 5-cent fares and free universal transfers) which has been satisfactory to the community and generally regarded as exceptional by tourists from many lands who visit Hawaii at all seasons of the year. No strike has ever occurred.

Operating costs have been relatively high compared with those of mainland cities of like size, yet the patronage and economies have been such that dividends have been regularly paid for eighteen years, the annual rate after 1912 being 8 per cent, based for several years past on a capital stock issue of $2,000,000, which includes $892,500 representing earnings used for extensions. The company has no debt. Its bonds, issued in 1902 and 1903, were redeemed in 1917.

Years ago Mr. Peck invented the "zone" transfer ticket, which has invariably prevented irregular circuit riding on a single fare over the Honolulu system. It was described in the ELECTRIC RAILWAY JOURNAL of Oct. 20, 1907, page 857. He has attended several conventions of the American Electric Railway Association.

Under the title of "Honolulu Rapid Transit Company, Ltd.," the traction system is entering upon a new era of operation under a recently enacted "fair-return-on-fair-value" franchise which provides for control by the utility commission with constant right of purchase reserved to the municipality, and with right of amendment and repeal reserved to the Legislature of the Territory of Hawaii and to the United States Congress.

During his long connection with the rapid transit company, Mr. Peck has also been active in other business fields, in which he continues, especially as president of the First National Bank at Honolulu, which is the chief depository for the United States Government in Hawaii. During the war period he served as chairman of the Territorial Central Committee for the Liberty and Victory Loans.

L. T. PECK

Transition from Conductor to Physician

Conductors have many times become railway presidents; they have become newspaper editors; they have, upon occasion, become bank directors. John T. King, who officiates for the Minneapolis (Minn.) Street Railway, however, is almost a doctor. He has now only three years more in the medical college of the University of Minnesota, one year of interneship, and three years of special study in Europe before he is ready to start upon his career as a medical specialist in diseases of the blood. As if conductoring and attending college were insufficient to keep a real man busy, Mr. King attends night school where he studies shorthand so that he may take down his medical lectures more fully. Mr. King is married, and is buying a home in Minneapolis. He has already worked his way through high school.

And though Mr. King is chiefly interested in red corpuscles and in determining the correct amount of iron the blood should contain, he rings up each fare as if his sole concern in life were receiving the money, registering the passenger, and notifying the motorman to stop at the next block.

Dr. Winslow Directs Health Work of Safety Institute

The Safety Institute of America announces the appointment of Dr. Charles Edward Amory Winslow as health supervisor. He will have charge of the new work planned by the institute, which includes, in addition to the prevention of accidents, the study of influences which affect the health of industrial workers.

Dr. Winslow, who will supervise this new branch of the Safety Institute's work, has for many years been a conspicuous figure internationally in the field of health and sanitation. In addition to his connection with the institute, Dr. Winslow is at present professor of public health of the Yale School of Medicine, lecturer at Teachers' College of Columbia University, chairman of the New York State Commission on Ventilation and senior sanitarian of the United States Public Health Service Reserve.

Quarter Century of Service

Although the Louisville (Ky.) Railway has had some strikes in the past twenty-five years, it has a total of eighty-seven men who have been with it for a quarter of a century or more. Of this number six are conductors, twelve motormen; two colored janitors, fifteen trackmen; four carhouse foremen; eight office employees; seven power house employees; twenty shop employees; twelve inspectors. Jacob Fishbach ranks first in years of service. His employment dates back to 1868. Mr. Fishback is with the transportation department. The Louisville *Courier Journal* devoted an entire page in one of its issues to illustrations showing these various groups of old employees and one group of the six members of the Co-operative Welfare Association's general committee.

Farewell for Mr. Colton

J. W. Colton, new editor of *Aera*, the publication of the American Electric Railway Association, was the honor guest at a dinner at Hotel Heublein, Hartford, Conn. The hosts were his associates on the Hartford *Times*, on which he has been one of the editors. Mr. Colton assumes his new duties at once.

The Biggest Job of Its Kind in the World

Nearly Four Hundred Miles of Municipal Electric Railway at Detroit Now Under Management of Joseph S. Goodwin, Who Began His Career as a Trainman

JOSEPH H. GOODWIN has been chosen to manage the entire street railway service in Detroit, Mich. It was logical that he should have this post for he has had charge of the original system of 100 miles of municipal lines in Detroit since construction of the city's system was begun there. It may be only a coincidence—and it probably is—but "Joe" Goodwin is a man after Mayor "Jim" Couzens' own heart. Mr. Goodwin has come up from the bottom.

Started as Motorman

This man upon whom will now fall the responsibility for operating the largest system of municipal street railways in the world was a motorman back in 1895. Even now he is only 45 years old. But into those forty-five years has been packed a world of experience. If "Joe" Goodwin had not been progressive he would still be a motorman. He improved every job he ever held, and when he couldn't improve the job he was on, he got another job. He didn't always stick to the railway business either. And strange to say, he had made up his mind to quit the railway field altogether and had set the date for so doing, when a telegram from Detroit brought the first intimation that a new kind of opportunity in the railway field was to come to him and hold him.

All these years up to the time of his appointment to the Detroit post in 1920, Mr. Goodwin had been dreaming how he would run a railroad if the opportunity came to him to have the final say-so. And it did come to him with his appointment to the Detroit municipal railway. The sponsors for the municipal railway admitted they knew little or nothing about railroading. They picked a man for the job in whom they had confidence and they left him pretty much to himself to work out his own salvation. This was just what Mr. Goodwin wanted. It was an experience new to him in many respects, for although his reputation had been established as a worker and a handler of men, never before had the opportunity been presented to him to put into execution some of the ideas of management and men that had been developing with him since the days when he was on the front platform of a car himself.

Exponent of One-Man Car

A volume might be written on the trying experiences of the starting of operation of the original municipal railway system in Detroit, and if such a tome were composed it would be largely a eulogy of the accomplishments of this man Goodwin from New England. He was one of the first electric railway operators to realize the place of the one-man car as a transportation agency and also one of the first to recognize that transportation can be sold like any other commodity. His methods, particularly in selling transportation, were a revelation to Detroit.

Mr. Goodwin is an indefatigable worker. His physical energy knows practically no bounds. Best of all he is approachable. Here is where he shines with the rank and file among men. They know that "Joe" Goodwin knows, for they know that he has been through the mill. Like nearly all other men of his kind Mr. Goodwin goes direct to the heart of things. He reaches by intuition, if you will, in a few seconds a conclusion that others would arrive at only after going laboriously through the dull processes of ratiocination. Such a man is always a mystery to some. They appreciate his worth, but to them the talent by which he succeeds is apt to appear uncanny.

J. S. Goodwin

But it has been said that "Joe" Goodwin was a motorman. So he was. As previously related this was back in 1895. It was on a road in Massachusetts that he served first. Then Mr. Goodwin moved over into Rhode Island in the same kind of work. In 1901 Mr. Goodwin was still a motorman. This time he was with a road in Connecticut. When the opportunity came for advancement Mr. Goodwin was found ready and waiting. He became a dispatcher. Shortly thereafter the "Who's Who in the Railway World," as the JOURNAL'S biographical file of operating officials is known, records that Mr. Goodwin had become manager of the Hartford & Springfield Street Railway at Warehouse Point, Conn. In 1917 he was made manager of the lines of the Connecticut Company in Bridgeport. This has always been one of the most difficult of that company's properties to handle. This in brief is the record in railroading of the man now responsible for running the local lines in Detroit. His career does, however, include a period when he was engaged in commercial pursuits for a Boston firm with his headquarters at Hartford. It is a big undertaking, this managing all the Detroit lines that has been handed to Mr. Goodwin, but it may confidently be expected that Mr. Goodwin will make good at it. That is what "Joe" Goodwin has been doing all his life—making good. A large factor in that process has been his energetic aggressiveness and willingness in capitalizing the advantage of any new development in the art.

Nothing that will improve operating efficiency is being overlooked on the Detroit Municipal, for the whole organization is to a remarkable degree a unit with him in the single purpose of making the municipal system a success—a success as measured by the standards and equivalent requirements of private operation. Regardless of one's views on the wisdom of municipalization of the street railways of any community, one cannot but note with admiration the real accomplishment and service principles that reflect to Mr. Goodwin's lasting credit in Detroit.

The details of other organization assignments in connection with the operation of the municipal lines in Detroit are published elsewhere in this issue.

"It Isn't a System. It's a Man"

Thomas E. Mitten is the subject of a sketch by A. St. John in *Barron's* for May 15 in the department "Men in Wall Street's Eye." Nothing that is new to readers of the ELECTRIC RAILWAY JOURNAL is told by Mr. St. John about the career of the president of the Philadelphia Rapid Transit Company in electric railway work, but the sketch is very entertainingly done. For that matter, the barest facts about Mr. Mitten make entertaining reading.

Mr. St. John says that in view of Mr. Mitten's great success in Philadelphia the question naturally arises why his system cannot be put into effect elsewhere. Mr. St. John answers this by saying that Mr. Mitten himself believes that his success is due to a system workable anywhere, but, says the writer, this belief is not shared by everyone else. As evidence of this Mr. St. John cites the remark of one man when it was suggested to try the Mitten plan of management in another large city. This man's reply was: "It isn't a system. It's a man."

E. A. Butler Resigns

E. A. Butler, for the last two years trainmaster of the Interstate Public Service Company, Indianapolis, Ind., on its lines south of Seymour, has resigned. He will be succeeded by George D. McLean, who has been with the corporation for fifteen years, but on the north end. Mr. Butler plans to engage in business at Columbus. Mr. McLean will have his headquarters in New Albany.

Changes in General Electric Directorate

C. A. Coffin Retires as Chairman and Is Succeeded by O. D. Young—E. W. Rice, Jr., Succeeded as President by Gerard Swope

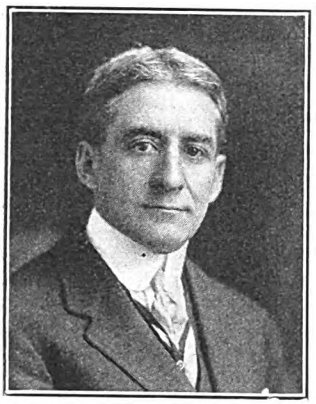
Following a meeting of the board of directors of the General Electric Company, held in New York on May 16, C. A. Coffin retired as chairman and was succeeded by Owen D. Young, long associated with the company as vice-president. The position of president was filled by the election of Gerard Swope, president of the International General Electric Company, succeeding E. W. Rice, Jr., who requested to be allowed to devote his entire energies to the further upbuilding of the scientific, engineering and technical phases of the company's work and who will become honorary chairman of the board of directors. Anson W. Burchard, for many year identified with the company as vice-president, with particular reference to public utilities and foreign investment, was elected vice-chairman of the board. J. R. Lovejoy, vice-president in charge of sales, was elected a director, as was also G. F. Morrison, vice-president.

Mr. Coffin, the retiring chairman of the board, was one of the organizers in the early eighties of the Thomson-Houston Electric Company, one of the predecessors of the General Electric Company. With several associates, for the most part business men of Lynn, Mass., he became interested forty years ago in the electrical inventions of Prof. Elihu Thomson and took a most active part in the direction of the company formed to develop these inventions. Upon the consolidation in 1891 of this company and the Edison General Electric Company to form the General Electric Company, Mr. Coffin became its president and continued in that office until June, 1913. In that year he retired to make place for E. W. Rice, Jr., and became chairman of the board.

E. W. Rice, Jr., who now has retired from the presidency, also came into the organization through the Thomson-Houston Electric Company, having been an assistant previously to Professor Thomson. He is also an inventor himself, having taken out more than 100 patents, and has given special attention to the engineering side of the work of the General Electric Company. His engineering ability and judgment enabled him to direct most successfully the engineering policy of the company. This is notably so in the case of the development of the tungsten lamp, steam turbine and a.c.-d.c. distribution. Mr. Rice was president of the A. I. E. E. in 1917-1918.

Mr. Young, the new chairman of the board, is a lawyer by profession. He was born in Van Hornesville, N. Y., on Oct. 27, 1874, and is a graduate of St. Lawrence University and Boston University Law School. He began the practice of law in Boston in 1896 and lectured on the subject of law in Boston University from 1897 to 1904. In addition to his interest in the General Electric Company he is chairman of the board of directors of the Radio Corporation of America, director of the Electric Bond & Share Corporation, Bankers' Trust Company and many other organizations. He was a member of the committee of one hundred of the American Electric Railway Association in 1919-20 and took an active part in its work.

Mr. Swope, the new president, has had both an engineering and commercial training. He was born in St. Louis, Mo., on Dec. 1, 1872, and received his elementary education in the local public schools and was graduated from the Massachusetts Institute of Technology in 1895. That fall he entered the employ of the Western Electric Company. Starting from the bottom in the shops at Chicago, where he was first assigned, he worked his way up department by department to an executive position. His first promotion was to the power apparatus engineering department as designing engineer. Next he organized and was first manager of the company's St. Louis house, opened in 1901. Four years later he was called back to Chicago and made manager of the power apparatus department. When in 1908 the company went out of the power apparatus field Mr. Swope was transferred to New York as general sales manager, and in 1913 he was elected vice-president. This connection he severed Jan. 1, 1919, to become president of the International General Electric Company.



GERARD SWOPE

OWEN D. YOUNG

E. W. RICE, JR.

E. P. WALLER

E. P. Waller Made Manager of Railway Department

E. P. Waller has recently been appointed manager of the railway department of the General Electric Company, of which department he has been assistant manager since 1912. J. G. Barry, who has heretofore held the two positions of general sales manager of the company and manager of the railway department, will devote his entire time to the work of the sales managership.

Mr. Waller was born in Martinsville, Va., and was graduated from the Virginia Polytechnic Institute in the class of 1900. Following his graduation he entered the testing department of the General Electric Company at its Schenectady Works. After two years in the testing department he joined the staff of the publication bureau, assisting in writing and editing bulletins, instruction books, technical letters, etc. When the *General Electric Review* was instituted he became associate editor. In the fall of 1903 Mr. Waller took up commercial railway work.

Mr. Waller has for many years been active in the committee work of the American Electric Railway Association and he is a member of the Engineers' Club of New York.

It Pays to Attend Auction Sales

One electric railway company in a large city has paid special attention to auction sales of material suitable for the stock room and repair shops. The advertisements relating to these sales are carefully watched in the head office, and if any sale looks promising the supperintendent of equipment or other competent officer who knows the value of materials attends the auction. Here are some of the prices paid during the last six months or so for some equipment:

Carbon steel drills up to ⅝ in. diameter, 30 cents a dozen; a 2⅛-in. high speed drill, which normally would cost $35, $5; some smaller drills which would cost about $6, 30 cents each; a miscellaneous lot of high-speed tool steel, 187 lb. for $3; lathe dogs of different sizes, 10 cents each; emery wheels of different sizes, 10 cents to $1 each; hack saw blades, which naturally would cost $3.50 a dozen, 14 cents a dozen; taps, from a half cent to 5 cents each; wood band saw, which normally would sell at about $300, $87.

Some Figures on Tin Production

For many years British Malaya contributed more than one-half of the world's tin supply, and today the Federated Malay States still hold first place as the largest individual producers, though the export has fallen from 50,837 tons in 1908 to 34,446 tons in 1921. The tin-ore exported from the hinterland is smelted in Penang and Singapore, and Straits tin takes the highest rank in the metal markets. Tin exports from the Straits Settlements ports to the four main importing countries are:

	1913 £	1918 £	1919 £	1920 £
United Kingdom	7,039,338	3,199,592	4,823,872	4,006,851
United States..	3,565,588	10,493,452	6,991,629	8,527,794
France...	519,129	1,773,173	700,342	843,663
British India and Burma.	372,772	428,664	596,802	649,635

In considering these figures, allowance must be made for the lack of shipping facilities to Europe and for other war influence.

The amount of tin exported from the various ports of the Straits Settlements for the years 1913 to 1920 inclusive averaged 61,709 tons per year.

Electrification Considered for National Railways of Mexico

Engineers are making a study of the practicability of electrifying two or more divisions of the National Railways of Mexico. It is stated that the power for the purpose of operating trains may be obtained from the plants of the Guanajuato Electric Light & Power Company and the Northern Power Company, which are situated in proximity to the two or more important divisions of the railroad system. There is a surplus of power available at these plants, but should it be found that the National Railways can obtain cheaper power by constructing its own hydro-electric plant this will be done. An abundance of water power is available at different localities adjacent to the divisions which are to be electrified.

$45,000 for Equipment

The International Transit Company, Sault Ste. Marie, Ont., has purchased five new modern cars at a cost approximately of $45,000. The cars will be placed in operation as soon as they arrive. They are equipped with the latest devices, are constructed of steel throughout and are furnished with air brakes and automatic steps.

Reports Equipment Will Come from U. S.

It is reported by an official of Harbin, Manchuria, that the contract for electrical equipment for the tramways of that city, including the power plant, has been awarded to the Hua Sheng Trading Company, representing an American firm. The amount involved is $2,270,000 gold. The above-mentioned company is composed of Chinese and American interests, and the equipment for this contract will come largely from the United States.

Houston Lines to Be Double-Tracked

The Houston (Tex.) Electric Company has placed orders for steel for improving its lines under the agreement with the city by which a sixteen-year extension to its franchise was granted, and 300 tons of steel rails are now en route, according to W. E. Wood, general manager. The steel will be used in relaying and extending the double-track line on North Main and Louisiana Streets and in relaying the Leeland line. Double tracking of the Harrisburg line will come next, Mr. Wood said. The company has been granted authority by the City Council to double track its line on West Alabama and Roseland Streets at a cost of $3,900 and also to double track the same line on Hawthorne Street from Tact to Audubon, at a cost of $3,800. Under the agreement of the traction company with the city by which the franchise was extended sixteen years approval of all expenditures must be given by the City Council.

Metal, Coal and Material Prices

Metals—New York	May 16, 1922
Copper, electrolytic, cents per lb.	13.25
Copper wire base, cents per lb.	14.75
Lead, cents per lb.	5.425
Zinc, cents per lb.	5.475
Tin, Straits, cents per lb.	30.625
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$6.75
Somerset mine run, Boston, net tons	3.50
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	4.125
Central, Ill., screenings, Chicago, net tons	....
Kansas screenings, Kansas City, net tons	2.625
Materials	
Rubber-covered wire, N. Y. cents per lb.	5.75
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$1.97
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	96.00
White lead, (100-lb. keg), N. Y., cents per lb.	12.25
Turpentine (bbl. lots), N.Y., cents per gal.	90.00

Rolling Stock

Department of Street Railways, Detroit, Mich., will probably purchase about 200 additional motor cars early this summer.

Springfield (Mass.) Street Railway is making over between twenty and thirty cars of the double-truck type into one-man cars.

Los Angeles (Cal.) Railway is planning to have the first twenty-five cars of the order of fifty of 1,200 type in operation for the Christmas holiday rush traffic. The new cars are practically the same type as the original twenty-five now in service. They will seat fifty-four passengers each, have an inclosed center section with opened sections at front and end. All the new cars will be equipped with multiple unit control. These cars are being built by the St. Louis Car Company and were mentioned in the issue of May 6.

The Buffalo & Lake Erie Traction Company, Erie, Pa., the Erie Electric Motor Company, the Erie City Passenger Railway, the Erie, Reed Park & Lake Side Street Railway and the Buffalo & Lackawanna Traction Company have been ordered to contract with the J. G. Brill Company for twenty-five one-man safety cars for operation by the Erie & Suburban Railway in the city of Erie, Pa. The agreement for the leasing of the cars and payment provides that the cars are to be single-truck, double-end, equipped with Birney safety motor car bodies complete with G. E. 264-A motor equipment, K-63 double end control, G. E. air brakes and safety devices, C. P.-25 compressors and Brill No. 79 E-1 trucks. Mention of this order is made elsewhere in this issue.

Track and Roadway

Grand Forks (N. D.) Street Railway expects to rebuild within the next three weeks 1 mile of single track in paved area with new 70 lb. International steel ties.

Eastern Massachusetts Street Railway, Boston, Mass., is considering the question of extending the tracks of the company through Brookings and French Streets, Lowell, Mass.

Hutchinson (Kan.) Interurban Railway within the next month will re-tie and pave 4,500 ft. of track. The work will be a rock ballast job with 2 in. of rock asphalt material for the finish surface.

Holyoke (Mass.) Street Railway may be asked to relieve congestion in a busy quarter. A petition is before the Holyoke Board of Public Works calling for relocation of the tracks in Main street from Dwight Street to Cross Street. It is asked that the tracks be moved 4 ft. to the east to give room for two vehicles to pass abreast.

Gary (Ind.) Street Railway is planning to reconstruct its tracks on Broad-

Digitized by Google

way from the Wabash Railroad to the north terminus at the steel mill gates. This track will be laid on steel ties in concrete and on 6-in. concrete foundation. It is also desired to build an extension on Ambridge Street north from Fifth Avenue to the gates of the American Bridge Company.

Millville (N. J.) Traction Company has been requested by the Borough Commissioners of Vineland to pave Landis Avenue or remove the tracks from that thoroughfare. The commission says that if this is not done it will take the matter up with the Board of Public Utility Commissioners. Business men of Vineland declare that they would rather have a uniformly paved avenue than the trolley tracks.

Cleveland (Ohio) Railway through its president, John J. Stanley, has announced that extensions are going forward. The company is building one of the extensions in the southwestern section of the city along Broadview Road and the other extension in the southeasterly section along Cedar Road. The extensions involve an expenditure of $200,000 and will add 2 miles of single track to the system.

Interborough Rapid Transit Company, New York, N. Y., through the Powers-Kennedy Contracting Corporation has started on the extension of the Queensboro subway from Grand Central Station to West Forty-first Street and Eighth Avenue. The contract was awarded for $3,867,138. The contractors have promised to rush the work and keep the streets clear of obstructions as far as possible.

Dallas (Tex.) Railway proposes that its next extension shall be a line out Lindsley Avenue through the East Side addition to connect with the Mount Auburn and Park View lines, according to W. M. Holland, president of the company. This line would traverse a section of the city now thickly populated and would afford car service to many residents now several blocks removed from the nearest line. The line would be about 1 mile long.

Tiffin, Fostoria & Eastern Electric Railway, Fostoria, Ohio.—The contract for the Columbus Avenue paving in Fostoria was awarded by the County Commissioners April 4. It provides for a 2-in. bituminous top on an 8-in. concrete base. The railway company will improve the street between rails of its track with stone with a tar or bituminous binding. Because the company's franchise in Fostoria is soon to expire and because of narrowed profits due to motor truck and motor bus competition, Fostoria and county officials agreed to permit the company to improve with stone.

Northwestern Ohio Railway & Power Company, Oak Harbor, Ohio, has secured the right of way south of Port Clinton, Ohio, for constructing about 2 miles of 22,000-volt transmission line. Work on this line will be started at once and when completed it will be possible to remove the present 22,000-volt line from Sixth Street, Port Clinton. Six miles of the overhead construction east from Port Clinton, Ohio, is being rebuilt, the 000 trolley wire being replaced by 0000 wire, which will greatly improve service in that section.

Utah Light & Traction Company, Salt Lake City, Utah, has begun its annual spring repair work on many of its tracks and the pavement coming under its control. Many important improvements are contemplated, including the re-laying of tracks in some sections and entire new roadbed construction in others. The company plans to use reinforced concrete slabs instead of laying paving blocks along the work. After the ties and steel have been laid the outside of the rail will be paved with cement slabs 4 ft. long and 18 in. wide. The inside slabs will be 1 ft. in width.

Connecticut Company, New Haven, Conn., is planning to tear up the tracks and bedding on Main Street, Middletown, and will put in a new bedding and replace the trackage. The cost will be in the neighborhood of $35,000 and the work will be done by the company's own work crew. The city of Middletown recently requested the Connecticut Company to put the line in proper condition before the city went ahead with the new reinforced concrete pavement on Main Street, for which the contract has been awarded at a cost of $135,000.

Power Houses, Shops and Buildings

Western Ohio Railway, Lima, Ohio, is adding 18 ft. to the 170-ft. smokestack of the generating station at St. Mary's.

Consolidated Gas, Electric Light & Power Company, Baltimore, Md., which supplies power for operating the cars of the United Railways & Electric Company, plans to extend its present substation in McClelland Alley. The contract for the electrical equipment has been awarded to the Westinghouse Electric & Manufacturing Company. It consists of a 16,000-amp., 25-cycle booster converter with an air blast transformer and switchboard. The converter will be installed in place of an 8,000-amp. unit which is at present in use.

Interstate Public Service Company, Indianapolis, Ind., operator of the Indianapolis & Louisville traction line, is planning to construct a freight terminal at Kentucky Avenue and South Street in Indianapolis, which will improve shipping facilities. The new terminal will be a one-story brick and steel structure with 420 ft. frontage on Kentucky Avenue. It will be 35 ft. wide and will cost about $90,000. Construction work will begin as soon as the contract is awarded. The aim, Harry Reid, president of the company, said, is to complete it as soon as possible so that congestion at the Market Street freight house can be relieved. Construction of the building will be under the supervision of the Interstate Terminal Realty Company, organized as a holding company, the capital stock of which is $90,000.

Professional Note

Arthur L. Mullergren, consulting engineer, formerly member of the firm of Benham & Mullergren, consulting engineers of Kansas City, announces the opening of offices at 555 Gates Building, Kansas City, Mo., and 1705 Equitable Trust Building, New York City, for a consulting engineer practice, specializing in electric light, power plants, etc. He will engage in the design and supervision of construction of such works and the making of investigations, reports, appraisals and handling rate cases.

Trade Notes

The J. G. Brill Company, Philadelphia, Pa., announces the resignation of W. M. Lycett as purchasing agent, effective May 15. B. O. Brill has been appointed as his successor.

Metal & Thermit Corporation, New York, N. Y., announces the removal of its Pittsburgh branch office from 1427 Western Avenue to 801-807 Hillsboro Street, Corliss Station, Pittsburgh, Pa.

C. W. E. Clarke, power engineer of Dwight P. Robinson & Company, addressed the American Society of Mechanical Engineers at the annual meeting at Atlanta on May 10 and 11 on boiler room performance and practice at the Colfax power station of the Duquesne Light Company.

The American Supply Company, Providence, R. I., has been appointed agent for the Providence district to represent the Quigley Furnace Specialties Company of New York, manufacturers of Hytempite. The Quigley products are warehoused in Providence for quick delivery to local points.

Westinghouse Electric & Manufacturing Company announces that in future copper coils only will be furnished for water-cooled transformers. These will be furnished at the same price as was previously charged for iron coils. The officials of the company consider the copper coils more durable than iron, and as these are to be furnished without increased cost to their customers a benefit of an average price reduction of about 4 per cent results.

New Advertising Literature

Poughkeepsie Paint Company, Inc., Poughkeepsie, N. Y., has issued a booklet describing the sanding filler "Filkote." The booklet also contains formulas for oil and japan fillers.

The J. G. Brill Company, Philadelphia, Pa., has recently issued Bulletin No. 259 descriptive of the Brill 77-E Truck and Bulletin No. 262 descriptive of the Brill No. 50-E Truck.

An Attractive Car Is an Efficient Salesman

A FIRST-CLASS salesman does not depend entirely upon correspondence to sell his product, but knows that it is highly desirable for him to come into personal contact with the customer. The rolling stock of an electric railway is one of the essential points of contact between the railway and the traveling public. The general appearance of both the interior and exterior of cars should, therefore, be kept in a condition pleasing to present or prospective riders. The chief engineer of one of the largest electric railway properties in this country recently remarked that he had found that a well-painted car, kept in good condition so as to eliminate noise, is so good an advertisement that it increases the riding sufficiently to pay for the additional expense necessary to keep it in this condition. Unfortunately, it has seemed necessary during the past few years, in the interest of economy, to curtail painting programs. Only such cars have been selected for painting as were in the greatest need and a great amount of temporary painting has been done. This has interfered with the sales appeal of the cars.

Now, the painting of cars and the keeping of the paint in an attractive condition is an important factor in producing a pleasing appearance. Experience has shown, also, that paint can be maintained in good condition more economically by touching up and revarnishing at frequent intervals, rather than by burning off and repainting at long intervals. It is encouraging to note, therefore, that painting schedules are again being restored and arranged so as to interlock with the overhauling schedules of the car equipment.

Canadian Association Convention Affords Opportunity for Co-operation

THE eighteenth annual convention of the Canadian Electric Railway Association, which will be held at Quebec beginning June 1, should be attractive to railway men from the United States as well as those from the Dominion. That this is appreciated is shown by the scheduling of the meeting of the executive committee of the American Association at Montreal on May 31 and the probable meeting of the committee on way matters of the American Electric Railway Engineering Association at Quebec during the convention. At least one paper on the program will be presented by a man from the southern side of the border, and a number of United States manufacturers will have exhibits.

There has been for many years a strong feeling of fellowship between the Canadian electric railway men and the "Americans," as residents of the United States are often erroneously termed because of the lack of a convenient abbreviation for "resident of the United States." Operating men have crossed the border, to and fro, in the exchange of executive talent between the two countries. The bond of mutual respect and experience was strengthened by the Ottawa convention last year. It will be further strengthened at Quebec. In commemoration of the coming convention, this paper has gathered in one issue timely information regarding several Canadian properties, from Vancouver on the west to Sydney, 3,000 miles away on the east. This is appropriate not only on account of the convention, but because Canadian electric railways have been active sources of news in this field recently. The changing from the left-hand to the right-hand rule of the road in British Columbia, the taking over of the Toronto system by the municipality, the practically complete destruction by fire of the Levis County Railway's equipment, the return-current controversy in Winnipeg and the activities of "Hydro" in Ontario are typical items. There ought to be no lack of topics of interest at the Quebec meeting.

The choice of Quebec for this year's meeting is fortunate. The historic association and the uniqueness of the site and layout of the city furnish attractions of no mean strength. The visitors will also find in operation a prosperous and progressive railway system which is meeting local transportation needs under unusual topographical difficulties.

Proposal for a Higher Degree of Financial Accountability

WILLIAM Z. RIPLEY, professor of political economy at Harvard, in an article in the *North American Review* on the steam railroad situation, suggests that bondholders ought to have some share in the management, at least as regards those companies near bankruptcy. Of course it is easy to marshal against such a proposal a summary of the limitation of the rights of bondholders, to say that the bondholder has advanced money on certain conditions and that if these are fulfilled he has no other moral or legal claims upon the property, and then dismiss the matter from further consideration. But that doesn't dispose of the matter altogether.

Just at this time the way does not seem easy to a realization of the suggestion of the professor, but who can say that the proposal of today may not be the accepted fact of tomorrow? On this ground alone the proposal deserves attention. If the plan is economically sound it should not be difficult to bring it about. Loans are constantly maturing and being replaced by new ones, and the possible purchaser of the new issue, as a lender, could insist on any provisions which seemed to him better to secure his loan.

In the light of experience within the last ten years it does not seem unreasonable to say there has already been a tendency in this direction. Thus, in the case of the Interborough Rapid Transit Company, something like this occurred when the bankers acting for the lenders of

Digitized by Google

the money laid down conditions about the payment of dividends while the loan was outstanding. In general, the feeling is not uncommon among bondholders in the utility field that the bankers who float bond issues should look out for their interests when they are in peril.

One critic of the professor's proposal declared that application of the plan would be followed by a revolution in finance because the greater part of business is conducted on a basis of about 80 per cent credit to 20 per cent cash. This argument proves too much. It is, of course, true that the risks which the stockholders assume are those that bondholders seek to avoid, though they do not always succeed in doing so. Moreover, where does the argument lead that the very carefulness that makes the investor a bondholder rather than a stockholder unfits the bondholder for the rôle of owner or part owner? The history of not a few reorganizations would seem to prove that the conservatism of bondholders who through foreclosure and reorganization have been converted unwillingly, perhaps, into owners has made them most successful in this rôle.

There is, perhaps, no keener student of the financial problems of the railroads than is Professor Ripley. His latest proposal may seem academic, but the suggestion should not be discussed with quite the air of abandon that some of the commentators upon it have assumed.

How the Distance Fare Differentiates the Passengers

NO LATER than our issue of Dec. 10, 1921, it was noted how a differential fare, such as the unlimited-ride weekly pass, gave a clue to the variety of customers served by an electric railway. The article also showed their degree of tenacity in using the service of the railway—or at least in paying for the privilege of using that service whether they actually used it or not. Now comes another confirmation of the value of any fare system which differentiates the passengers. This time it is from London, where they use the zone system.

It appears that at a recent meeting of the governing committee of the London County Council Tramways General Manager A. L. C. Fell produced some interesting figures to prove why the minimum fare, for which a ride of 1.2 miles was given, should be reduced to a penny instead of the inconvenient 1½ pence, a multiple coin fare, which is now in effect. The reason for the interest in this class of passenger fares lay in the fact that for the twelve weeks ended Sept. 28, 1920 and 1921 respectively, the number of passengers paying fares of 3 pence and upward showed an increase while the lower fare passengers dropped off. Translated into terms of distance, this meant there had been a loss in all grades of short-haul passengers, within the 1½ and 2 pence distances for which a maximum ride of 1.8 miles was permissible. On account of this showing the Tramways Council agreed to reduce fares by lengthening the stages. The penny stage was increased from 0.6 to 1.2 miles, the 2 pence stage from 1.8 to 2.4 miles and the 3 pence stage increased from 3.0 to 3.6 miles. This plan entirely eliminated the unwieldly and awkward multiple coin 1½ pence fare. The new fares became effective last December, and significantly enough the motor buses operating in the tramway are also followed suit.

Such news dealing with surface car travel is of more than passing interest even if it comes from the zone systems of London, for it shows clearly what every electric railway operator does not yet, but nevertheless should, understand, namely, that their patrons are made up not only of necessity riders but also of persons who are not compelled to ride. The latter are predominantly persons who can walk if they choose and each manager ought to have plans under way contemplating turning these walkers into riders. If he fails to cater to them, these people who constitute the cream of the traffic so to speak, and whose fares may mean the difference between a loss and a profit, he is selling his service on the basis of the minimum needs of the community instead of making it of the maximum benefit. No industry can be successful until some of its output is bought without compulsion.

Will Seattle Be Forced to Quit?

MUNICIPAL ownership and operation of the local railway at Seattle is the rock on which the ship of political ambitions is being wrecked in that city. In quick succession, since municipal ownership became a fact there, that city has had three Mayors—Ole Hanson, Hugh Caldwell and now B. J. Brown. Mr. Caldwell started out well to wrestle with the legacy which Mr. Hanson handed down to him, but he didn't get very far. As soon as he had been installed as Mayor, Mr. Caldwell employed a special investigator to inquire into the railway matter. The grand jury also took up the subject. The inquiry by the jury did not disclose any evidence that any one connected with the city administration had profited financially by the purchase transaction, but the jury did say that the Mayor and the Council had been slack in conducting the negotiations. As a result the Mayor recommended that the City Council take the steps necessary to secure relief from a contract which the jury considered to be incapable of performance according to its terms.

The unfeeling Council, however, took no action on this except to pass a resolution not to levy taxes for the support of the railway. It had ideas of its own with respect to the matter. The most important of these was that a 10-cent cash fare and an 8⅓-cent ticket rate would result in an income during 1921 of $6,704,642. At the close of the year, however, the receipts were from $300,000 to $400,000 short of this amount. The Council also thought that there would be $1,060,000 on hand last March toward the annual payment of the interest and the principal on the purchase price. On its prediction with respect to this amount the Council proved to be wrong by $500,000.

Mr. Caldwell says there can be no hope for a reduction in fare except by a revision of the terms of the contract by which the city took over the local lines. This is how the outgoing official sees it. The incoming Mayor, however, is for the 5-cent fare. He says the matter of a return to the 5-cent fare is one of the first problems that he will tackle when he assumes office. There the pretty situation stands.

Seattle certainly let itself in for a peck of trouble when it took over the local railway. Mayor-elect Brown may succeed where Mayor Caldwell has failed, but it seems more likely that the situation will eventually result, as Mr. Caldwell has predicted, in the turning back of the system to the original owners or the appointment of a receiver through failure of the city to live up to the terms of the purchase contract.

PANORAMIC VIEW OF QUEBEC CITY FROM THE RIVER

Quebec's Railways and Their Power Supply

Growth of Local Transportation Has More than Kept Pace with that of Population—In Twenty-five Years, While Population Has Doubled, Car-Mileage Has More than Quadrupled, Number of Passengers Carried Has Sextupled and Gross Earnings Have Octupled

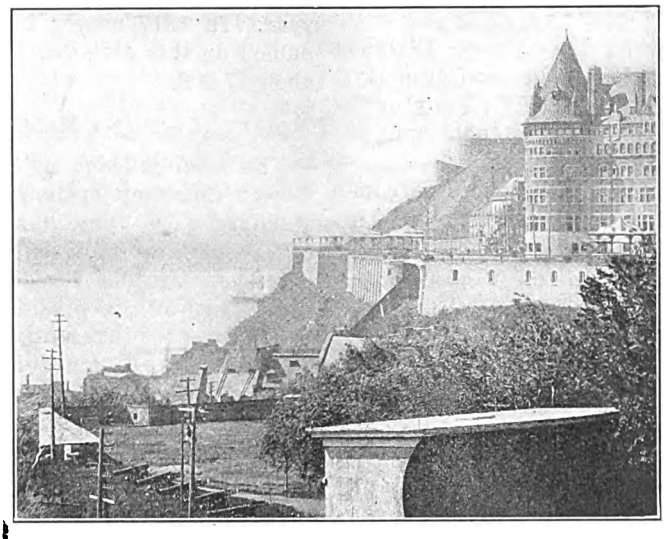
THE city of Quebec is the seat of government of the Canadian province of the same name and it is now well into the fourth century of its history. It was founded, in fact, the year after the Jamestown colony in Virginia; that is, in 1608. The founder was Samuel de Champlain, the explorer, after whom Lake Champlain was named.

The physical characteristics of Quebec have an important bearing on the local electric railway situation, for the city is built on two levels, known respectively as Upper Town and Lower Town. The city is situated on the eastern end of a narrow promontory which is bounded to the southward by the River St. Lawrence and to the northward by the valley of the St. Charles. The cliffs on the St. Lawrence side run up the river for many miles and average between 200 and 300 ft. in height.

The earliest buildings of Quebec were constructed along the narrow shore at the foot of Cape Diamond and gradually extended to what is now Lower Town. In many places in this section parts of the river bed have been reclaimed. Winding roads cut out of rock, and flights of steps, lead from Lower to Upper Town.

Quebec claims the distinction of being the only walled city in North America and it is probably the one which has preserved most closely the impress of its founder.

Electric railway service in and about Quebec is furnished by the Quebec Railway, Light & Power Company, which is owned and controlled through total ownership of stock by the Quebec Railway, Light, Heat & Power Company, Ltd., of which E. A. Robert was recently elected president.*



THE CITADEL AND BEYOND, WITH THE CHATEAU FRONTENAC AT THE RIGHT

The Quebec Railway, Light & Power Company comprises three divisions: (1) the City Division, operating the street railway lines in the city; (2) the Montmorency Division, operating a line of railway, both electric and steam, along the river between Quebec City and St.

Joachim, which connects at the latter point with an exclusively steam-operated railroad known as the Quebec & Saguenay Railway, now forming a part of the Canadian National Railways, and (3) the Power Division, which supplies electric power for residential and commercial purposes in the city and surrounding district.

MORE THAN FIFTEEN MILLION PASSENGERS NOW CARRIED YEARLY

The city street railway, then the Quebec District Railway and now the City Division of the local property, commenced operations on July 20, 1897.* Its growth is clearly indicated in the accompanying table and its present extent in the map of the city lines.

The Montmorency Division is a suburban line comprising about 30 miles of track. It serves a thickly settled community along the river and handles a large volume of freight business. Its connection at St. Joachim with the Canadian National Railways is an important factor in its business.

This division transports somewhat more than one-seventh the number of passengers the City Division does, the annual peak of about 2,270,000 having been reached in 1920. The number fell slightly under 2,200,000 last year. In 1917 nearly 10,000 carloads of freight were hauled on this division, the number for last year being about 7,500.

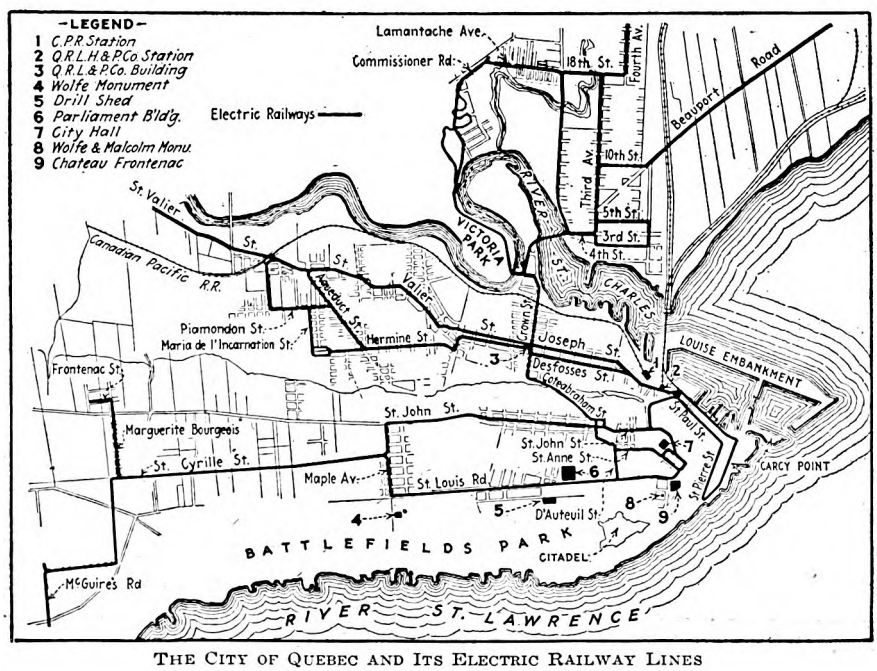
COMPANY MADE A PROFIT LAST YEAR

The total mileage of the Quebec Railway, Light & Power Company system is about 78 and its track is standard gage. One hundred and fifty motor and 220 other cars are employed in its service. Ten new pay-enter cars are due for delivery at about this time. In the report of the president to the board of directors recently issued and covering the year ended Dec. 31, 1921, the gross earnings were shown to be $2,757,836, an increase of $203,424 over the preceding year. The year's surplus was $87,513, as compared with a deficit of $33,172 for 1920. The present surplus is $684,413.

As the power and electric railway developments in Quebec have been closely related, a brief summary of them will indicate how the present organization has been evolved.

Back in 1884 there was a small electric lighting steam plant with two "T-H" dynamos located in an old military barracks beneath the fortification walls near St. John's Gate. It belonged to the Quebec & Levis Electric Company. The following year a hydraulic plant, under a head of about 130 ft., was installed at Montmorency Falls, 7 miles below the city. At first the lighting circuits contained only

*Readers of this paper will be interested in the account of the two horse railways, previously operating respectively in Upper Town and Lower Town, which appeared in the STREET RAILWAY JOURNAL "Souvenir Edition," October, 1895.



THE CITY OF QUEBEC AND ITS ELECTRIC RAILWAY LINES

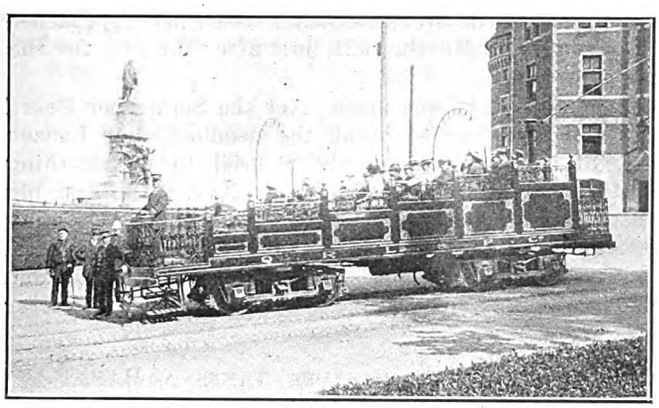
Digitized by Google

arc lamps, but in 1888 incandescent lamps were supplied with alternating current transmitted at 1,000 volts and distributed at 52 volts.

In 1893 the company became the Montmorency Electric Power Company, which in 1894 built a modern hydraulic plant, with a 6-ft. flume furnishing 170 ft. head. This was the plant that furnished power to the Quebec District Railway through motor-generators in a substation in Quebec. The flume was next carried to the brink of the falls, increasing the head to 190 ft., and a 300-ft. concrete dam was built.

An Early Steam Railroad Electrification

Next, in 1898, the power company, the District Railway and the Quebec, Montmorency & Charlevoix Railway (a steam road) were amalgamated under the name of the Quebec Railway, Light & Power Company.



A "Seeing-Quebec" Car Leaving the Chateau. Note the Grade of the Street on Which the Car Stands

The steam road was soon after (in 1900) electrified from Quebec as far as St. Anne de Beaupré, with consequent further enlargement of the Montmorency power plant. A 200-kw. motor-generator set was installed at St. Anne de Beaupré, 14 miles from the power plant.

Developments now came thick and fast. In 1907 a further development was made at the Natural Steps on the Montmorency River about a half mile above the Montmorency Falls plant, giving a capacity of 1,500-kw. Two years later the transmission was changed from two-phase to three-phase and at 23,000 volts. Scott-connected transformers were installed at Montmorency and Quebec to interconnect the transmission and distribution lines.

In 1909 a merger was formed of the Quebec Jacques Cartier Water Power Company, the Frontenac Gas Company, the Canadian Electric Light Company (of Levis, P.Q.,) the Quebec Gas Company and the Quebec Railway, Light & Power Company, forming the present parent company known as the Quebec Railway, Light, Heat & Power Company, Ltd.

River, at Valcartier, with two three-phase generators of a capacity of 750 kw. each. Transmission to Quebec is at 23,000 volts, and there is a steam auxiliary plant in the city comprising three 350-kw. generators.

The Canadian Electric Light Company has a power development on the Chaudiere River, near Charny, with two 750-kw. and one 1,000-kw. three-phase generators, developing power at 11,000 volts, and transmitting 9 miles to a substation in Levis. The Levis and Quebec substations are connected by means of submarine cables across the St. Lawrence River.

From the Levis substation power is supplied to operate the Levis County Railway,* the Louise Dry Dock, and all electric requirements on the South Shore.

The Laurentian Power Company of Seven Falls, P.Q., also supplies electric energy to the Quebec Railway, Light, Heat & Power Company, Ltd., under contract. Seven Falls is approximately 35 miles from the city of Quebec.

Snow Removal Allowances the Stumbling Block

Rehabilitation of Levis County (Quebec) Railway Held Up Pending Agreement as to Amounts to Be Paid by Municipalities Served

BY H. E. WEYMEN
Manager Levis County Railway, Levis, Que.

THE editors of this paper have asked me to explain the developments on our property since the disastrous fire which occurred Feb. 21, 1921, and which wiped out our carhouse, shops and all of our equipment and rolling stock excepting four Birney and two converted one-man cars.† The succeeding events were as follows:

After the fire we were able to give only a partial service. This was on a twenty-minute headway on the Lauzon division and the up-town division and one of three-quarters of an hour or one and one-half hours on the Quebec Bridge division. The long headway occurred when one car was undergoing repair.

As all of our six cars were required to give even this limited service, we had no spares,

With the help of a newspaper campaign we prepared the way for a general meeting of the four municipalities and the Levis Board of Trade. The Board of Trade took the question up itself and appointed a committee to study the tramway question.

Although the company's loss was fully covered by insurance, as measured in terms of the cost of the property, this insurance was not sufficient to replace the loss at the present-day prices and it meant an investment of an additional $100,000 over and above the insurance money to make good the loss.

The company found itself unable to obtain this additional money unless there was some prospect of revising the franchise conditions under which it was operating. Two municipalities, St. Romuald and Lauzon, were opposed to any changes and would not even give us a hearing. However, the Levis Board of Trade finally invited all parties to a general meeting, which was held at Levis on April 6, 1921, at which the exact situation of the company was explained by Dr. Louis Herdt, consulting engineer, and other directors of the company.

The main point of the discussion was the cost of snow removal in winter, which is too heavy for the company to bear.‡ After this meeting, and allowing time for the situation to be discussed by the municipalities, a further meeting was called in July, at which each of the four municipalities made its offer. Three offered the company less than it had been receiving excepting the effect of a revised fare. The city of Levis only increased the allowance for snow removal.

The company, of course, was unable to finance the fire loss on these terms and the whole matter came to a deadlock. Another meeting was called in September by the Board of Trade and its committee, as a result of which a second delegation approached the Premier of the province, asking his assistance, supplementing the efforts of the first delegation which had approached the Premier in March, 1921, just after the fire, for the same purpose.

Repeated effort was made after the September Board of Trade meeting to break the deadlock, but Lauzon and St. Romuald absolutely refused to do anything further. In consequence, when on Nov. 9 the first big snowstorm arrived, the company was obliged to store its cars in a temporary shed for the winter. A local garage operated two buses from Levis Ferry to Lauzon, but on the remainder of the system no service whatever was given.

PROVINCIAL LEGISLATURE TAKES A HAND

In February, 1922, another delegation waited on the Premier asking him to do something to break the deadlock, and in consequence the Legislature passed a law giving the Public Service Commission jurisdiction. In the meanwhile, the city of Levis made another attempt to get the other municipalities to make an offer which would be acceptable to the company. This again fell through and late in March the city of Levis passed a resolution making a certain offer to the company which, if refused, would be referred to the Public Service Commission, together with the propositions of the other municipalities for arbitration and a judgment. Lauzon immediately took action in the civil court to cancel the company's franchise and force it to remove its track and equipment. In the meanwhile, the new law came into effect and the company agreed with the city of Levis to refer the whole matter conjointly to the commission with a request to it to bring the other municipalities into line. The case came before the commission on April 26, when Lauzon and St. Romuald opposed the jurisdiction of the commission. The commission, however, maintained that it had jurisdiction and the hearing of the case went on. Lauzon, on finding that the commission had jurisdiction, withdrew its action on condition that the company pay the costs of the action before the civil court. St. Romuald, however, refused to acknowledge the jurisdiction and took an injunction against the commission to stop the hearing. This, however, on the following day was refused and the case continued and finally closed on May 4. The company had Dr. Herdt as its expert, together with Professor Burr of McGill University. Judgment was reserved by the commission, but one is expected by the end of this month.

*An article on the Levis County Railway appears on this page.
†See issues of this paper for Feb. 26, 1921, page 429, and March 5, 1921, page 460.

‡In an illustrated article in the issue of this paper for April 3, 1920, page 699, Mr. Weymen explained the snow conditions involved in a Levis winter.

Does a Small Company Need a Safety Supervisor?

Manager of Nova Scotia Property Says that the Essential Requirement for Successful Accident Reduction Is Conviction of Its Importance on the Part of the Executive

BY C. C. CURTIS
Manager Cape Breton Electric Company, Ltd., Sydney, N. S.

THE manager of an electric railway who does not have a keen, genuine and personal interest in the safety work of his organization is not only missing a lot of fun but is seriously reducing the overall efficiency of his men, and is probably wasting, in settlement of claims, money which might better be spent for the constructive purpose of preventing accidents. He is also neglecting an opportunity of getting in closer touch with his fellow-workers, learning their points of view and drawing out many who have the welfare of the company always at heart, but who too often do not find an opportunity of demonstrating this fact.

It seems inconceivable that there should be public utility managers left of those who only a few years ago apparently felt that a claim agent capable of driving a hard bargain was far superior to a claim agent intent on preventing accidents.

Probably the old type is extinct; in any event, let's assume that every one nowadays believes in preventive measures and would like to have a "safety first" organization functioning at all times. How is it to be done? Must a small company have a safety supervisor and an elaborate plan, or is there some simple way which will produce results? My only answer is to describe briefly one scheme which has worked, not the best we are free to admit, not perfect in all its details, but simple, inexpensive and workable.

A SIMPLE ORGANIZATION ONLY IS NEEDED

The Cape Breton Electric Company, Ltd., under Stone & Webster management since its incorporation in 1902, operates a street railway in the city of Sydney and through the towns of Glace Bay, Dominion, North Sydney and Sydney Mines, serving a total population of about 60,000. Included in the system is an interurban line between Sydney and Glace Bay, a distance of 14 miles. Two ferryboats are operated across the harbor between Sydney and North Sydney, a distance of 5 miles. The company distributes light and power in all these cities and towns except Glace Bay, where there has been a municipal plant for twenty years.

A little more than three years ago, after considerable thought and discussion as to the best way of organizing for safety, we decided that the only way was to go ahead and see what would happen. It was felt that fire prevention was in many ways so closely related to accident prevention that it should be included in our scheme, and experience has shown that it makes our work more interesting, and the results are extremely gratifying.

A central safety committee was appointed, consisting of the superintendent and assistant superintendent of the railway department, the master mechanic, the inspectors and foremen, the assistant treasurer, the light and power superintendent, the superintendent of distribution, the chief engineer of the power station, the line foreman, the meter foreman, the superintendent of the ferry department and a few others from all departments.

For the first year or more meetings of this central committee were held weekly, since then bi-weekly. The personnel changes slightly from time to time, but superintendents and foremen are always kept on the committee.

A clerk in the manager's office acts as secretary, keeps minutes of all proceedings and looks after the distribution of safety literature and copy for our

CAPE BRETON ELECTRIC COMPANY, LIMITED

Minutes of Safety Meeting of Night Trainmen—Sydney & Glace Bay Division

April 4, 1922.

Meeting opened in Sydney Lobby at 9.30 a.m. on Monday, April 3, by reading of minutes of previous meeting, which were approved as read. Mr. Bulley comments as follows: Last car to reach Henry Street should pull up far enought so that the rear end would be beyond the front end of the waiting car. Passengers alighting would then see car on other track before they started to cross the tracks. Complaints about cars should be reported on in and out sheets and if nothing is done then it should be taken up with Inspector. If he doesn't attend to it bring it up in Safety Meeting.

N. Munroe—Car 6 was not coasting Friday. H. J. McNeil—Doors on car 52 not fixed. M. McKenzie—Roof on car 203 still leaking in vestibule. Switch at Ashby Corner not plugged and car split it once in a while. The tongue is slightly bent. This will be attended to. Mr. Bulley referred to the newspaper report of a woman falling in a water hole at Ashby Corner. She fell in the puddle of water covering the sewer in front of McDougall's Store. This sewer is blocked and has been reported to the City Engineer. H. J. McNeil knows about it.

P. C. Leonard, nothing.

J. McKinnon—Water has made a rut along side of car rails on Prince Street. Autos run down this rut and do not attempt to turn out until the car is very near. They then find it is almost impossible to get out of the track. Mr. Bulley suggested that in cases like that the motorman take a few seconds to explain to driver how dangerous a practise it is to drive so close. This might help out in several cases.

Mr. Bulley read an article from a magazine comparing the stopping distances of street cars and automobiles.

J. A. McPherson, nothing; M. McKenzie, nothing. H. J. McNeil—New poles on Townsend Street above George should have stop marks repainted. Since doors of all cars are only open on one side of street the marks should be painted on left hand side coming from the Esplanade.

R. Richards—Hanger straps should be placed in small cars, Several missing.

J. A. McDonald—Sanders not working on all Bay cars. On some it does not throw on rails.

N. Munroe, nothing; P. Diggins, nothing.

H. Strickland—The Glace Bay crossing diamond is pretty rough.

A. Cameron—Gave an illustration where he opened ventilators as car was hot and some passengers thanked him. When collecting fares further down the car one passenger complained of cold so he had to close them. Mr. Bulley read an article from a magazine on Statler Hotel rules. A. Cameron brought up the delay caused by trainmen having to carry lantern, stool, headlight and tool box from one car to another when changing. If permanent places were made for lantern and tool box on each car then time would be saved. This will be looked into. Meeting adjourned at 10:55 a.m.

(Signed) E. O. SMITH

SAMPLE SAFETY COMMITTEE MEETING MINUTES

Digitized by Google

general newspaper advertising, which includes a considerable amount of "safety first" propaganda.

The manager acts as chairman of all meetings unless unavoidably absent. At each meeting minutes of the previous meeting are read and approved, then anything left over is discussed and, if possible, disposed of. After that suggestions are called for and fully discussed. Recent accidents or near accidents are studied for the purpose of preventing similar ones in the future, and always the thought is stressed that most accidents and fires are preventable if only proper precautions are taken in advance. Each man is encouraged to think for himself and to put the principles which he learns into practice, not only in his daily work but in his home life as well.

Accident prevention and fire prevention are the principal topics discussed, but no other subject is barred when time permits. An opportunity is thus offered for all men present to learn something more than they otherwise would concerning the conduct of our business. An atmosphere of frankness prevails and all the cards are laid on the table. If wage reductions are necessary the reason therefore is clearly explained and our financial reports are studied like accident reports.

Aside from the central committee, each superintendent acts as chairman of a local safety committee, consisting of all the men in his department. Meetings are likewise held bi-weekly at such hours as will be convenient for the majority of the men. Trainmen, trackmen and carhouse men meet in this way and each becomes familiar with the problems of the other.

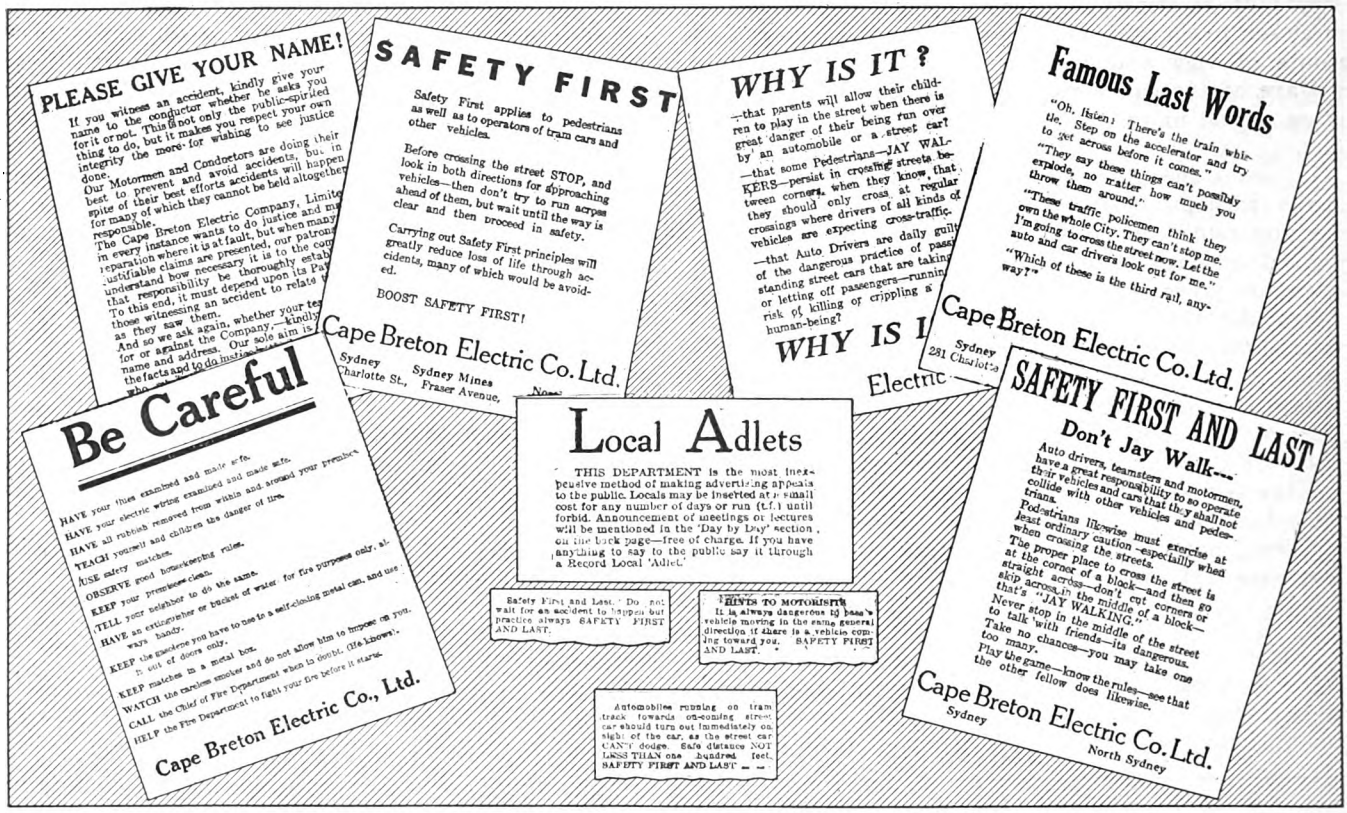
Recommendations made by the local committees are brought before the central committee for discussion and decision, but very often action has already been taken by the superintendent and no formal decision by the central committee or manager is necessary.

The idea is continually kept in mind that results are what we seek, and superintendents have ample authority to put into effect desirable suggestions without delay, provided of course that the expense is not prohibitive.

The time spent by men in attendance at meetings is at the company's expense except in the case of monthly men attending meetings held outside working hours, and such meetings are not frequent.

All Available Material Is Utilized

Our company is a member of such organizations as the American Electric Railway Association, the Canadian Electric Railway Association, the National Electric Light Association, the Canadian Electrical Association, the National Safety Council, the Canadian National Safety League, the National Fire Prevention Association, the Nova Scotia Accident Prevention Association, and the Society for Electrical Development, Inc. Through these organizations all kinds of material for the study of accident and fire prevention is constantly at hand and full use is made thereof.



SAMPLE ADVERTISEMENTS USED BY LOCAL RAILWAY IN SYDNEY, N. S.

Safety bulletin boards are placed at five or six main points on our property and bulletins prepared by the National Safety Council and the Canadian National Safety League are posted regularly so they may be seen by all who pass.

Safety calendars furnished by the National Safety Council have been purchased for the past three years and distributed to all our own men, as well as the schools in Sydney districts, public buildings, etc.

Material obtained from the National Fire Prevention Association is likewise given wide distribution among employees of our own company, and often sent out to the general public. About a year and a half ago we ordered from the National Fire Prevention Association

Digitized by Google

illustrated leaflets entitled "Dwelling House Hazards," "The Evil Wooden Shingle," "Clean your Chimneys! Reduce Fire Waste! Save Fuel," "Chimney or Flues (A fable for Builders)," etc. These were distributed to employees and a bulletin was addressed to them by the manager. Last Christmas a considerable number of copies of an illustrated leaflet entitled "Holiday Fire Warning for the Home," and another gayly decorated poster—"Keep the Fire Demon Away," both prepared by the National Fire Prevention Association, were likewise distributed to employees and many outsiders. All this work we consider not only effective in preventing fires and educating our own men, as well as the general public, but it helps to give us a reputation for being progressive and public spirited.

Co-operation is extended to schools, police, fire departments, health departments, fire insurance companies and any other agencies which may be active in connection with special drives, such as are put on during "Clean-Up Week," "Fire Prevention Week," "No Accident Week," etc.

Our advertising space in three daily newspapers is devoted from time to time to educational work along accident and fire prevention lines. Display "ads" on the subject of general safety and fire prevention are run rather frequently, and "readers" such as "Hints to Motorists—Slow down and proceed cautiously when passing street corners, schools and bridges—Safety First and Last!" are interspersed with "readers" designed to encourage people to ride on the street cars.

First-aid work has not been neglected either, and frequent demonstrations have been made of the prone-pressure method of resuscitation. A year ago some ten or twelve of our men took the St. John ambulance course, consisting of six or seven lectures on first aid by a qualified physician, and most of them passed the resultant examination without trouble.

A weekly fire inspection is made of all our property, including power houses, substations, carhouse, yards, etc., and reports are turned in promptly.

In conclusion, this prevention work pays, and it's not difficult. A safety supervisor is not indispensable to a small company, but what is indispensable is a firm and never changing belief on the part of the manager that accident and fire prevention are a part of the day's work.

New Power Distribution Center for Montreal

Cote Street Substation, Recently Constructed at Load Center of Tramways System, Will Serve as Power Distribution Headquarters—Rotary Converters Used Rather than Motor-Generator Sets Installed in Several Other Substations of the System

FOR five years or more the Montreal Tramways has had in process a general remodeling of its power distribution system. This has taken the form of a comprehensive layout of the system as a whole, following the plan of a ring transmission with radial mains, the placing of a large part of the mains and feeders in underground conduits, the relocation and remodeling of the substations and equipment and the building of new substations to supply the increase in demand as well as to subdivide the power supply to prevent undue concentration.

The principal supply of power for the tramways is water power, but a reserve supply is maintained, mainly by means of the Hochelaga plant remodeled in 1918.

The development of the power distribution of the tramways up to and including 1918 was covered in a series of articles in this paper as follows: A general article on the system as a whole, Jan. 12, 1918, page 72; the conduit lines and substations, with particular reference to the St. Denis and Pointe aux Trembles substations, March 9, 1918, page 449, and the remodeling of the Hochelaga power plant, June 8, 1918, page 1085. In the March 9 article reference was made to a proposed Cote Street substation, regarding which no details had at that time been decided. This substation has since been designed, constructed and put into commission, being located at the center of gravity of the city load. It is more than a substation, because its location, both with respect to the tramways' main offices and the center of the load, brought about a decision to make it the headquarters of the power and distribution department, and the load-dispatching center of the system.

The station is not large, as substations go, the engineers having decided to limit its capacity to 8,000 kw. to avoid any large concentration of return current in one locality. The station also is manually operated, but the rotary converter equipment was designated to use flash barriers and other improvements added elsewhere particularly to facilitate automatic operation. In this case the extras were included as an additional precaution against flashovers.

This additional precaution was considered necessary because the station operates in parallel with others on the direct-current side and is supplied on the alternating-current side from several different sources. One supply is from the Hochelaga plant, which is operated in parallel with the system of the Montreal Public Service Corporation. Power is received also from the system of the Montreal Light, Heat & Power Company.

Flexibility Characterizes the Distribution System

The cutting in of the new substation involved a rearrangement of mains as indicated in Fig. 2. This diagram includes the essentials of the 13,200-volt switching facilities at Cote Street. The plan shows that one bus is assigned to the Hochelaga power plant, with which connection is made by four mains. Another bus takes care of the two mains from St. Denis substation. A third provides connection with the William Street power plant, and the fourth is a transfer bus with which connection is made from the lines of the Montreal Light, Heat & Power Company.

This substation is so designed that the high-tension system can be sectionalized. It can also be operated "selective."

A more detailed plan of the substation wiring is given in Fig. 1. This diagram can be visualized by means of the general substation plan, Fig. 4, and the

THIS PICTURE WAS TAKEN BEFORE ROTARY NO. 3 WAS INSTALLED IN THE COTE STREET SUBSTATION

cross-section, Fig. 6, as well as the photographs which are reproduced. For convenience of reference the type and sizes of the various pieces of electrical apparatus are given in the plan in Figs. 1 and 4.

The space within the building is subdivided in such a way as to facilitate supervision of the equipment and to give a general appearance of spaciousness. The rotary converters are on the main-floor level, supported on substantial concrete columns. Four 2,000-kw. six-phase General Electric rotaries are installed. The control switchboards are on vertical panels on the main floor, the direct-current board on one side, the alternating-current board on the other and convenient to the high-tension switching equipment, and the house service board at one end.

One side of the main floor is partitioned off for the high-tension bus compartments, the roof of this section forming a gallery where the high-tension circuit breakers are located. In the basement below the bus compartment is the high-tension cable room, and adjacent to this is the long transformer room stretching the length of the rotary room above.

The cells and barriers in the high-tension bus compartment are of reinforced concrete, the three flat busbars of one circuit being mounted one over the other in separate runs. The space above these conduits is occupied with vertical compartments for the disconnect switches, connections to the circuit breakers, cross connections between buses, etc.

The feature of the bus arrangement is that it is possible to connect any distributing bus to either of the two main buses by means of selector disconnecting switches (double-throw switches) and the bus tie oil circuit breakers.

The rotary-transformer oil circuit breakers are directly connected to either of the two main buses by means of the selector disconnecting switches. Current transformers are placed between barriers, so as to give extra security. Asbestos cell doors are used throughout the bus compartments.

BUS AND TRANSFORMER ROOMS ARE LONG AND NARROW

The high-tension cable room, running along one side of the basement, is provided with cable entrances at each end. The risers from the cables to the oil circuit breakers are tapped in through lever disconnecting switches separated by asbestos barriers.

On one side of the cable room, against the transformer room, are the oil and water pipes for the banks

THE LOW-TENSION CABLES ARE RACKED OVERHEAD IN THE TRANSFORMER COMPARTMENT

of transformers located close by on the other side of the partition.

The transformer room is provided with a longitudinal track on which rolls a transfer truck for the transportation of a transformer to one end of the room, where it can be raised through a hatch by the main generator-room crane. The transformers are mounted on wheels and roll on cross-tracks to their respective places.

VARIED POWER REQUIREMENTS HARMONIZED ON THE SWITCHBOARDS

The main high-tension control switchboard contains the following panels: Four three-phase two-circuit incoming line and feeder panels, one three-phase two-circuit incoming line and bus tie panel, two three-phase two-circuit transformers and six-phase rotary panels, one three-phase two-circuit incoming line and bus tie panel, three three-phase two-circuit transformers and six-phase rotary panels, one three-phase two-circuit incoming line and feeder panel, and four six-phase rotary converter starting panels.

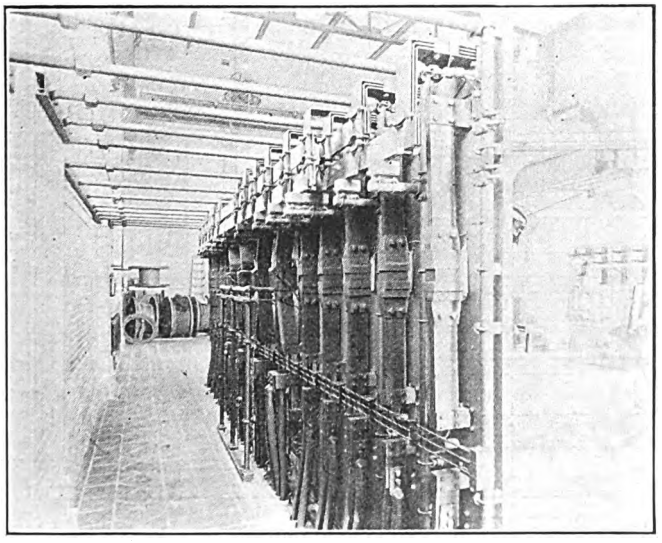
This high-tension switchboard controls five oil circuit breakers in incoming feeders from the Hochelaga power house and four oil circuit breakers for the incoming feeders from the central plant of the Montreal Light, Heat & Power Company, six oil circuit breakers for outgoing feeders to various stations of the Montreal Tramways, one oil circuit breaker for house service feeders, and four oil circuit breakers for the four banks of rotary converter transformers.

The incoming feeders are protected with reverse power relays, while the outgoing feeders and the rotary converter transformer circuits are protected by induction-type time-limit overload relays.

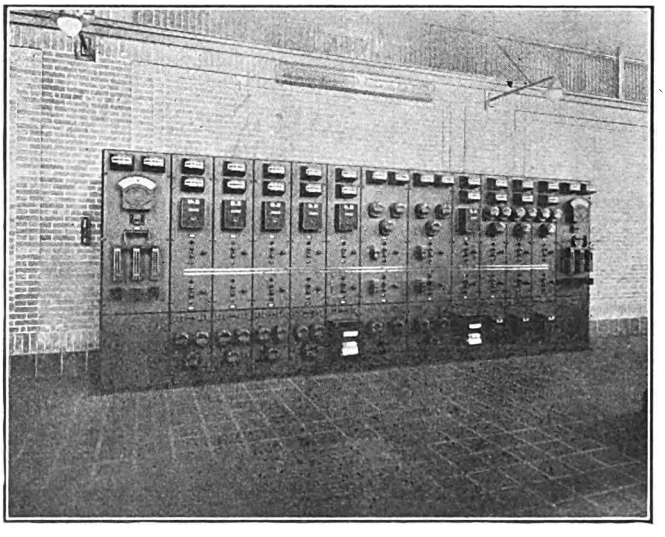
The rotary-converter transformer panels have an additional protection in a low-voltage release, which trips the high-tension oil circuit breaker and the rotary direct-current circuit breaker simultaneously, preventing a possible feed-back into the rotary and the direct-current system, which might cause overspeed.

To safeguard the rotaries against over-speed, they are, in addition, provided with speed-limit devices, and the rotary direct-current circuit breakers are provided with reverse-current relays.

This switchboard is equipped with mimic bus, showing at a glance the high-tension switching arrangement. All high-tension oil circuit breakers are remote-controlled, being of the familiar parallel-pot motor-operated type, excepting one oil circuit breaker controlling the house service, which is hand-operated.



ACCESSIBILITY IS A FEATURE OF THE DIRECT-CURRENT SWITCHBOARD



ON THE MAIN A.C. SWITCHBOARD A MINIATURE BUS REPRESENTS EACH ACTUAL BUS

Digitized by Google

Digitized by Google

The direct-current railway switchboard consists of four rotary and ten feeder panels.

On the rotary panels are single-pole Reversite air circuit breakers, with overload shunt trip and bell-ringing attachments; ammeters, control switches for operating the remote-control equalizer air circuit breakers; field rheostat control handwheels; single-pole, quick-break knife switches; d.c. watt-hour meters; reactive volt-ampere indicators and two-point potential receptacles.

All feeder panels are equipped with plain overload 750-volt, 3,000-amp. air circuit breakers and the usual auxiliaries. The d.c. board is a single-polarity board, with all framework insulated from ground. The positive bus is mounted immediately behind the board and is of the "hollow" type for good radiation. All bus copper is painted black for the same purpose.

All Negative Switching Is Done in Basement

Taking up now the direct-current circuits, and referring to Fig. 6, it will be noted that the main basement is directly under the rotary room. It contains the remote-controlled equalizer circuit breaker panels, the negative switch panels, the negative bus, the equalizer bus and the general direct-current 600-volt cable layout.

The negative cables connecting to the negative bus are provided with shunts, making it possible to read the current of the individual negative cables.

They are also provided with pressure wires, so that it is possible to determine the drop in the cables from the point where they are tapped to the rail.

The positive cables are racked along one wall (the north wall) and leave the station through a duct entrance at the east end of the basement where they enter the municipal underground duct system.

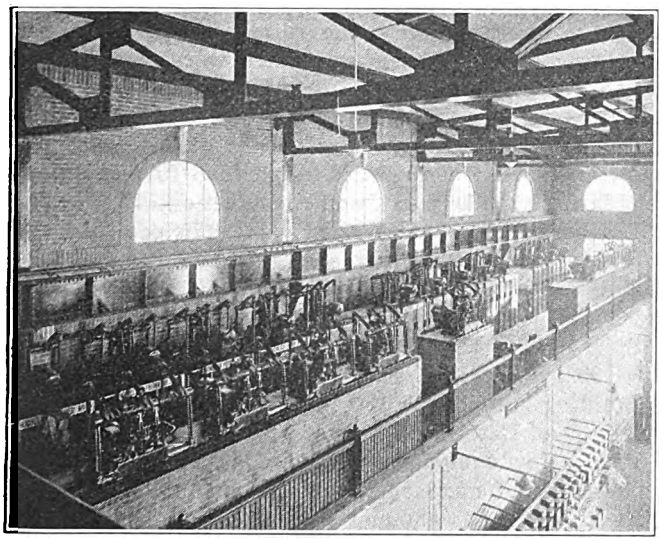
The arrangement of the equalizer remote-controlled air circuit breakers in the basement directly under the rotaries, and controlled from the direct-current rotary panels, gives the shortest possible equalizing connection between the rotaries and has the additional advantage of removing the breakers from the operating floor.

In all of the direct-current cable work between rotaries, switchboards and potheads on direct-current positive feeders, insulated cables with flameproof covering were used.

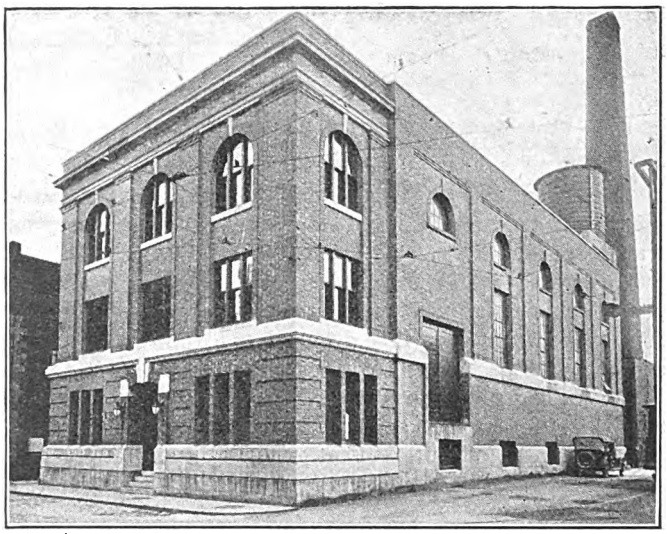
A part of the main basement is partitioned off as a battery room, to house the storage batteries used in connection with the remote-control switches, etc., and another small basement room is provided for the house service transformers.

Station House Service Is Liberal

The substation is well equipped with apparatus for house service. A bank of three 50-kva., single-phase, 60-cycle transformers lower the voltage from 12,100 to 2,200, and there is a bank of three 25-kva., single-phase 60-cycle transformers, which lower it further from 2,200 to 550 for miscellaneous power purposes about the station. Two 10-kva., single-phase transformers take power at 2,200 volts and deliver it at 220 or 110 volts for station lighting. Two 10-hp., three-phase, 550-volt induction motors drive centrifugal water pumps, and one three-phase, 550-volt induction motor drives an air compressor for service in blowing out electrical machinery in the plant. A 10-hp., three-phase, 550-volt induction motor direct-connected to a direct-current generator furnishes power for charging the 60-cell, 120-amp.-hr. storage battery.



A Birdseye View of the Circuit Breaker Gallery, A.C. Control Board Just Visible in Foreground



Montreal Tramways' Latest Substation Located on Cote Street

The house service switchboard from which the above equipment is controlled is located, as previously mentioned, at one end of the converter room, where it is directly over the house service transformer room.

Cote Street Station Is Latest Step in Local Power Distribution Development

In what has been said above, no attempt was made to catalog the various pieces of equipment which go to make up the station. As will have been noted, most of the apparatus is of standard types. The substation has been described in detail because it marks the latest in the evolution of substation design on the Montreal Tramways system.

From the architectural and structural standpoints, the building conforms with the tramways' standards. While the surroundings of the building were not such as to dictate special attention to appearance, the street front possesses the same architectural dignity as characterizes other recent substations of the company.

On account of the character of the ground on which the substation had to be placed, it was necessary to rest its foundation on piles. Of these more than 200 were used, reinforced concrete piles being selected on account

Digitized by Google

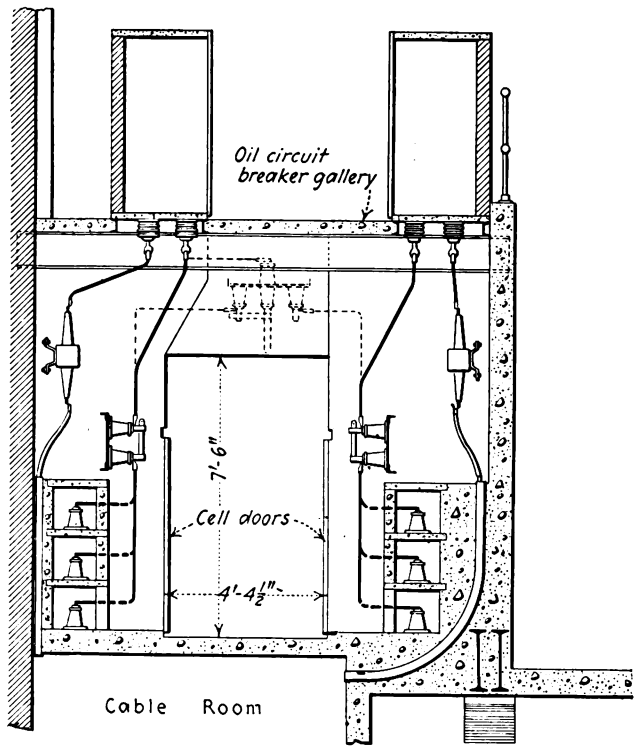


FIG. 5—CROSS-SECTION THROUGH BUS COMPARTMENT, SHOWING BUSBARS, DOUBLE-THROW TRANSFER SWITCH, ETC.

of their durability. To prevent leakage into the basement all concrete work below the surface line was waterproofed.

To provide water for cooling and other general purposes, an artesian well was drilled 1,005 ft. deep. From this water is pumped into a 13,000-gal. tank on the roof of the building.

The lighting of the station was given special attention, in the conviction that a well-lighted station is economical to operate. For general illumination two rows of 500-watt tungsten lamp fixtures were placed under the roof trusses and 100-watt lamps were hung on brackets around the walls of the rotary converter room. Throughout other parts of the building the lighting is on the same liberal scale.

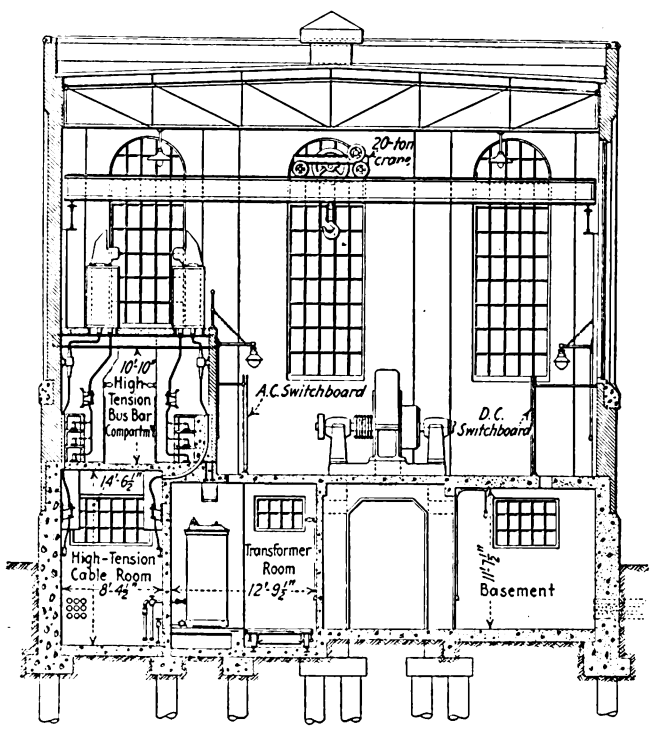

FIG. 6—CROSS-SECTION THROUGH PRINCIPAL ROOMS AND COMPARTMENTS OF SUBSTATION

The front of the building is occupied by offices already mentioned, and there is an additional office partitioned off from the main generating room for the load dispatcher. In this provision has been made for a private telephone exchange by means of which all the stations of the Montreal Tramways will be connected to the Cote Street substation by means of several private telephone lines.

In conclusion a word regarding costs will be in order. The total cost exclusive of site was about $779,000. Of this the building cost $191,000, the machinery and its installation $317,000 and the underground conduits and cables, with their installation, $271,000.

Internal Revenue Rules on Replacement

THE Internal Revenue Bureau has determined ratios of estimated post-war cost of replacement for use by taxpayers in computing claims for tentative allowance for amortization. The ratios are given in percentages based on the prices which were prevailing in June 30, 1916, as follows:

Ratios for computing estimated post-war cost of replacement of buildings, vessels, cars, tanks, blast furnaces, open-hearth furnaces, annealing furnaces, electric furnaces, coke ovens and construction of all kinds:

Lumber—hard, 240 per cent; soft, 175 per cent.

Structural steel, 60 per cent.

Building materials, other than lumber and structural steel, 225 per cent.

Steel (other than structural steel), and steel products, 90 per cent.

Building equipment, 150 per cent.

Labor, all classes, 160 per cent.

Ratios for computing estimated post-war costs of replacement of machinery and equipment:

Electrical machinery and equipment, 130 per cent.

Engines, turbines, compressors and similar facilities, 175 per cent.

Pumps, 135 per cent.

Boilers, 160 per cent.

Transmission equipment—shafting, pulleys, hangers, etc., 135 per cent; belting, 100 per cent.

Machine tools and small tools (machine tools are considered as that class of metal working machinery which can be used on both cast iron and steel), 130 per cent.

Woodworking machinery, 155 per cent.

Textile machinery, 155 per cent.

All other machinery, including cranes: machinery the cost of which did not exceed 10 cents per pound as of June 30, 1916, 120 per cent; machinery the cost of which did exceed 10 cents per pound as of June 30, 1916, 130 per cent.

Office furniture and equipment, 125 per cent.

Last month the Berlin Elevated Railway completed its first twenty-five years of service. Operation was begun April 13, 1897. To commemorate its twenty-fifth birthday the company has published a small but attractively illustrated pamphlet giving views of various stations and other interesting points along the line, with a map of the system.

MOTOR CAR AND TRAILER TRAINS ARE PART OF NEW TORONTO EQUIPMENT

Toronto's Progressive Rolling Stock

The Toronto Transportation Commission Has Added 250 New Cars to Its Passenger Rolling Stock and Has Remodeled More than 350 Other Cars

SINCE the Toronto Transportation Commission took over the operation of the lines formerly operated by the Toronto Railway Company, Sept. 1 last, it has received 190 new steel frame double-truck P.A.Y.P. type of motor cars and also sixty steel frame center-entrance double-door trailers. Bids have recently been requested for an additional 100 motor cars and 100 trailers. As yet the order for their construction has not been placed. Of the cars now in service, 140 motor cars and all of the trailers were built by the Canadian Car & Foundry Company. The Canadian Brill Company built fifty motor cars at its Preston works.

The motor cars seat fifty-eight and weigh 49,000 lb. approximately. The general dimensions and seating arrangement are shown in the accompanying illustrations. The trailers seat sixty-one and weigh 28,000 lb.

In the construction of the Canadian Car & Foundry Company cars steel center sills run the full length of the car bodies and the other members of the underframe are also of steel. The cars are provided with double floors, the lower floor being of 1-in. tongued and grooved white pine. The upper flooring is of ⅜-in. hard wood and between the two floors is a liberal coating of heavy lead and felt paper. Floor strips ½ in. x 1 in. are laid in the aisle between the cross seats. The trucks are Canadian Car & Foundry Company design with 4½ in. axles. The wheels used on the motor cars are 30-in. C.I and those on the trailers 22-in. C.I. Of the 140 motor cars built by the Canadian Car & Foundry Company, 100 are equipped with Westinghouse 533 T 4 motors, four motors per car. Forty are equipped with D K 83-A English Electric Company's motors. The cars equipped with English Electric Company motors have Q-2 form G controllers with a line switch contact. All motor and trail cars are built for single end operation.

The fifty cars built by the Brill Company are equipped with Canadian General Electric 241 B interpole ventilated 50-hp. motors and K 35 X A controllers with ratchet switch and General Electric line breakers type DB 976-A-7. Cincinnati Tool Steel Gear & Pinion Company's helical gears and pinions are used on all motor cars except those having Westinghouse motors. These are equipped with Nuttall helical gearing.

The English Electric Company's equipment consists

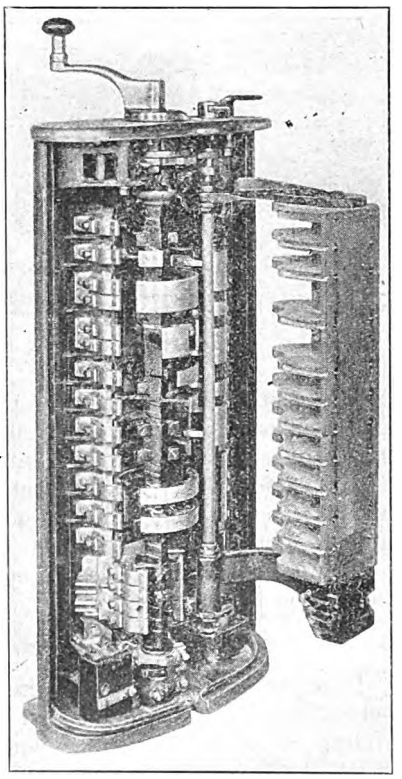
of four D.K.83-A, 55-hp., 600-volt, 640 r.p.m., series interpole, ventilated motors per car, one type "Q-2" form G controller, with magnetic shield blowout and slip ring switch, and one type H form Q resistance, consisting of six eleven-grid boxes for suspension under the car. The motors, which are of the four-pole series interpole type, are self-ventilated by a fan mounted on the armature shaft at the pinion end. This produces a dual flow of air through the machine, one current passing through the armature core and the other along the surface of the armature and through the field coils, thereby securing a very considerable reduction in the ultimate temperature rise. The frame is of the box type, the motor leads being brought out on the suspension bar side, the two armature leads at the commutator end and the two field leads at the pinion end. This arrangement proves very advantageous for double-truck cars. Among other desirable features to be found in the motor is the type of brush-holder, which is provided with a serrated clamping face, thereby securing rigidity and making it quite impossible for the holder to slip down onto the commutator. The interpole and main field coils are secured against movement by the insertion of a flat spring between the coil and the frame. The coil is protected from the spring by a light steel tray. The motor is designed in such a way that it is possible to drop it straight out of the truck without disturbing the wheels and axle.



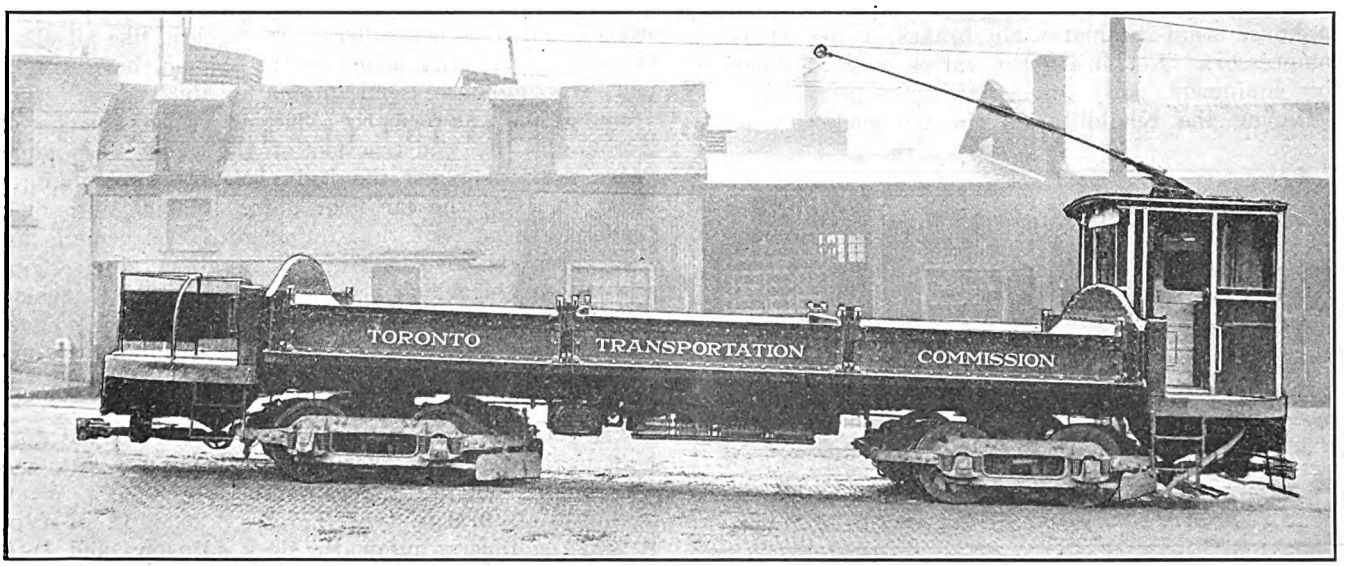
CONTROLLER WITH MAGNETIC SHIELD BLOWOUT, TYPE Q-2 FORM G

The gears were supplied by the Tool Steel Gear and Pinion Company of Cincinnati and are of the helical type, having a 7½-deg. angle. The gear cases are of the pressed steel type, are practically free from any riveting or welding and weigh complete 90 lb.

The controllers are for use with a four-motor equipment and are supplied with the "Zweigbergk" magnetic shield blowout coil to take care of any arcing that may possibly take place. The main power circuit is protected by a line switch with suitable overload devices, which is placed under the car, and the operation of this switch is provided for in a slip ring contact placed in the base of the controller.

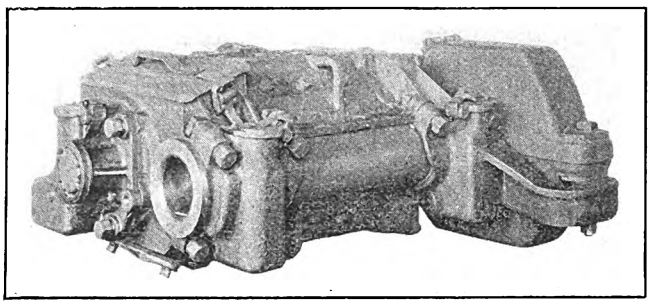
The method of motor cut-out is new to the American continent and is taken care of by a crank projecting outside the back of the controller. This crank is moved by using the reverse key, which is not removable unless the controller is in the "off" position, and an upward movement of the crank lowers the controller reverse drum and cuts out Nos. 1 and 3 motors, and inversely a downward movement cuts out Nos. 2 and 4. The motors cut out are shown on a dial plate. This method, of course, obviates the necessity of opening up the controller with consequent time lost and possible risk of burning and electric shock; also, when the motors are cut out the controller is designed to give the full series-parallel effect, virtually making the car into a two-machine unit.

In contrast to the usual practice with the four-motor controllers, four series and four parallel steps are provided, the even acceleration being provided for in the grading of the resistance, which is divided into five steps. The blowout coil is short circuited on the fourth and eighth notches, these being the two running positions where the blowout coil has no useful work to do. The controllers supplied on this particular contract are not fitted with any notching device on the main power drum, any excessive motor currents being provided for in the main line switch, but it is of interest to note that this feature can be quickly and easily fitted by making a slight addition to the power drum star wheel and the power drum handle, and when provided it is impossible to move the power drum through the eight notches in less than four seconds.

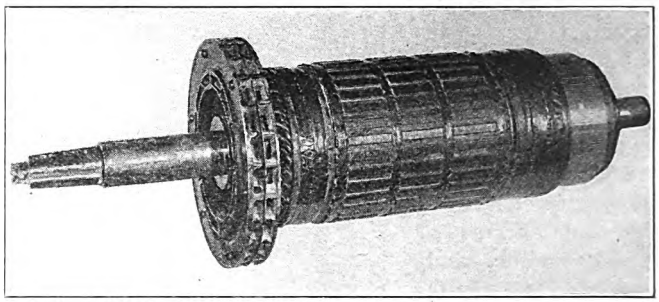


TYPE OF DUMP CAR RECENTLY ADDED TO EQUIPMENT

Digitized by Google



SERIES INTERPOLE VENTILATED MOTOR TYPE D K 83-A



ARMATURE FOR D K 83-A MOTOR

The resistance is of the "under-the-car" type and consists of six boxes, each box having eleven cast-iron grids. All grids are of the same pattern, thus reducing the number of different sizes of spares that must of necessity be stocked.

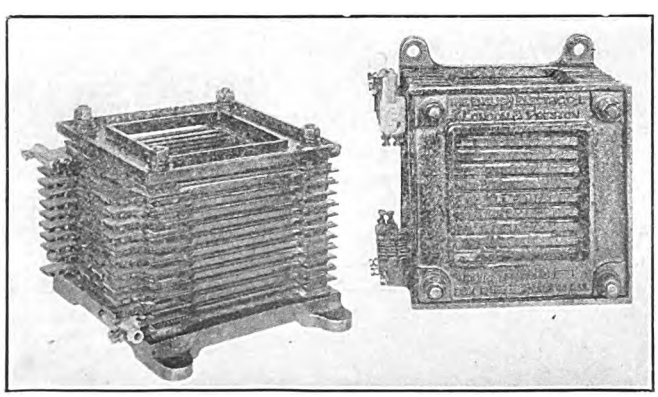
The door control and safety features of the National Pneumatic Company, which have been so widely adopted by a number of the larger electric railways in the United States, are installed on these cars and have proved of great advantage in operation.

Both motor cars and trailers are provided with Nichols Lintern indicating tail lights. A green light indication is given whenever power is being applied to the motors and a red light indication when coasting or braking operations are taking place or when the car is not moving. The red light receives its ground through a controller contact in the off position with both the English Electric Company and General Electric Company's equipment, but on the Westinghouse equipments the red light is grounded on the No. 4 armature lead. Tomlinson automatic air and electric couplers are used. Other equipment includes Peter Smith heaters type 2-P.O., which obtain air through the side of the car; Electric Service Supplies Company route and destination signs; Ohio Brass Company's headlights; air sanders; and drum switch for light connections between motor and trail cars; 140 sets Earll No. 10 catchers; H. B. life guards, and all motor cars have Nuttall U. S. 13 D trolley stands.

CAR REHABILITATION

Last winter 350 double-truck prepayment type cars were completely rehabilitated and the Maggan storage air brake system was removed and replaced by Westinghouse semi-automatic air brakes, using D H 16 compressors. K-1 emergency valves were also part of this equipment.

During the rehabilitation the old coal stoves formerly located in the center of the front end inside the bulkhead were removed and Peter Smith heaters of the same capacity as in the new cars were installed on the front platforms. With this rehabilitated rolling stock and the new motor cars and trailers, the company is able to put out on the street for rush-hour purposes a considerably better class of equipment than has ever been used in the city.



GRID RESISTOR FRAMES, TYPE H, FORM Q

SERVICE EQUIPMENT

In order to carry out the extensive program of track rehabilitation the commission has added additional rolling stock to its service equipment. Three differential dump cars with three pockets each and two crane cars for hauling and placing of rail and special work were added and eight additional differential dump cars have just been delivered. The differential dumping cars are mounted on Curtis D 2 trucks taken from old passenger cars and the work of mounting the bodies on them was done in the car shops. These cars are single-end equipments and have K 35 controllers, T.T.C. resistances and Westinghouse D H compressors and 4 G.E. 80 motors. They are also equipped with Tomlinson couplers and air-sanding apparatus.

The tilting body is divided into three compartments, each with its own side doors, so that different kinds of material may be hauled at the same time. The contents of the compartments, or a part of each compartment, may be discharged at different points, or the entire load discharged automatically at once. The material may be distributed along the track as desired by opening one door at a time and tilting the body gradually.

The crane cars previously mentioned are mounted on Diamond A frame trucks and also have 4 G.E. 80 motors and K 35 controllers. These cars, like all other motor cars recently added to the system, have single-end Westinghouse semi-automatic air brakes. The frame of one was formerly a flat car used by the city of Toronto in the construction of the Civic lines some years previously and the body bolsters were changed so as to lower the car floor 6 in. Watson automatic fenders are part of the equipment. The commission has purchased five McGuire Cummings single-truck snow sweepers, which are equipped with T.T.C. resistances, G.E. 80 motors and K controllers. These sweepers are provided with wings for leveling the snow which is thrown up by the sweepers alongside the tracks.

The commission has also had five steel-frame flat cars built in these shops. These cars are equipped with K-6 controllers, G.E. 80 motors, T.T.C. resistances, Westinghouse air brakes, type S.M.E.; 8 in. x 12 in. type S brake cylinders, automatic slack adjusters and D H 16 compressors.

Four Months of Right-Hand Operation

A Review of the Effects of Changing the Rule of the Road from Left to Right-Hand Operation on the British Columbia Electric Railway

BY W. G. MURRIN
Assistant General Manager British Columbia Electric Railway, Vancouver, B. C.

IN AN article which appeared in the ELECTRIC RAILWAY JOURNAL of Nov. 19, 1921, page 894, I gave an outline of the problems which confronted my company in regard to the change of the rule of the road from left to right-hand operation in accordance with the highway act, amendment act of 1920, of British Columbia.

Below I give a short résumé of the procedure in actually making this change, of the progress to date toward completing the work and of accident record, in so far as the company is concerned, during the first four months of right-hand operation.

A day or two previous to Dec. 31, 1921 (Jan. 1, 1922, at 6 a.m. being date and time set for change), practically all city cars had passed through our Vancouver shops, where changes, alterations and additions such as installation of temporary steps on right-hand rear side of cars, cutting an opening in right-hand rear end for entrance and exit purposes, installation of right front-end exit door and steps, etc., had to be made. As each car came into the carhouse on the night of Dec. 31 or early the next morning the right-hand rear and side were removed and the gates on the rear left-hand side were made fast. The front exit door on the left-hand side of the car was made fast and the temporarily installed right-hand front door was released for operation. This door for some time following Jan. 1 was not mechanically operated.

By 10 a.m. Jan. 1 all cars had received attention and were made suitable for operating temporarily. The car service on New Year's Day was affected but slightly by the change-over, and on the following days the regular services were maintained.

As all cars had by this time been temporarily changed over, our next step was to board up temporarily the opening on the left-hand rear end of the cars for protection of passengers and conductors from the elements, the weather at this time being particularly cold. This was accomplished by fitting in the temporary side removed from the right rear end of the car. This job finished, the installation of mechanically operated gates was next taken in hand. This in itself was a big undertaking. This work, together with installing mechanism to operate the front exit door by the motorman, has recently been completed and our attention is now being directed to the removal of the front vestibule bulkheads and the reinstallation of one with a door from the main body of car into the vestibule on the right-hand side of car. At present passengers leave the main body of the car by the door on the left-hand side of the front bulkhead, pass behind the motorman, and leave by the door on the right of car. For the vestibule changes which are now being made it is necessary completely to remove the present bulkhead, change the location of certain uprights and car wiring and reinstall a new partition. It will readily be seen that with twenty different types of cars in operation a tremendous amount of work is involved in this change and I estimate it will take a number of months to complete this portion of the work.

All the change-over work to date has been carried out without interference with the maintenance of our regular car service and in completing the work this factor is not being overlooked.

The accompanying table will indicate the effect the change-over from left to right-hand operation has had in respect to certain classes of accidents as compared with the same four months in the two preceding years.

ACCIDENT DATA—BRITISH COLUMBIA ELECTRIC RAILWAY, JANUARY-APRIL

	Passengers	1920	1921	1922
1	Boarding and alighting	62	78	129
2	Due to operation of car	103	38	38
	Collisions			
3	With pedestrians	25	26	47
4	With autos	253	213	231
5	With rigs	33	14	20
6	With street cars	16	9	11
	Totals	492	378	476

Of the figures in the table only those items numbered 1 and 3, for 1922, appear to require an explanation from me. Boarding and alighting accidents, numbered 1 in the above statement, for 1922 show a decided increase over the two preceding years and this is directly attributable to the cars operating during the greater portion of the four-month period in question, Jan. 1 to April 30, without rear entrance and exit gates. Now that all cars are equipped, a decided decline in number of accidents of this class is noticeable.

Accidents to pedestrians, numbered 3 in the table, are not so serious as at first glance they might appear. While the number of accidents in this period for 1922 shows a decided increase over same period for 1920 and 1921, not one of the forty-seven accidents was of a serious nature. All were more or less trivial and the increase can be attributed directly to the rule-of-the-road change.

We anticipated the possibility of the occurrence of serious accidents following the change-over and, with a view to offsetting this exigency, an elaborate advertising campaign covering various angles regarding the change to be made was carried on by my company for some weeks preceding Jan. 1, 1922, and there is no question in my mind but that this campaign accomplished its purpose and resulted in the extremely low accident record shown herein.

Saving a Second on Each Stop

IN A RECENT address given by him at the Institute of Transport, London, J. K. Bruce, traffic manager of the London County Council Tramways, referred to the saving on the London County Council Tramway system of one second at every stop. He declares that this would represent a total saving each day of 220 hours. This saving would enable approximately 2,000 additional car-miles to be run each day, without increase in the number of operators or number of cars. Put in another way, the same number of car-miles could be run each day with seventeen fewer cars. A saving of seventeen cars at £2,000 a year each would mean a reduction in operation cost of £34,000 a year. In addition to this saving to the owners of the tramway system there would be a very important saving to the traveling public as well as a reduction in street congestion.

Pertinent Points from the N.E.L.A. Convention

Happenings of Interest to Electric Railway Men Included Reports on Public Relations, Budget Control, Customer Ownership and Prime Movers—Operating Figures on Milwaukee Powdered Coal Station Presented

THE National Electric Light Association held its forty-fifth convention at Atlantic City from May 15 to May 19 inclusive. The convention was one of the best attended the association has ever had, there being a registration well in excess of 3,000. Throughout the whole convention there was a note of optimism, which apeared to be of fundamental soundness and not of mere Atlantic City manufacture.

There was a general feeling, concretely expressed by President M. R. Bump in his presidential address, that utilities can look forward confidently to a broad investment market which would justify proceeding with plans for necessary extension and rehabilitation.

This sentiment was also reflected by Carl D. Jackson, who spoke on "Some Post-War Problems of the Utilities." His address will be presented in abstract in an early issue.

Invested Insurance Funds Represent Public Ownership

Haley Fiske of the Metropolitan Life Insurance Company told of the large amount of public utility securities in which the people of the country who are saving their money in life insurance companies have a direct interest through the investment of these funds in such securities. Of the total insurance activities in the country—some 79,000,000 or more policies, representing probably policies on more than 50,000,000 lives—he pointed out that this meant that half of the people in the United States must be directly interested in the investment of funds in the utilities. In this way the public of the United States actually does own the utilities of the country, and this fact should be brought home very clearly to the public through publicity and educational work.

On the other hand, Mr. Fiske pointed out that the reason these securities were good investment for the funds made up of the savings of the public as a whole was that the officials of the insurance companies who had the responsibility of investing these funds expected good conservative management from the utilities. This meant that the funds would be safely invested and build up that reserve which is necessary to take care of the paying of obligations when life insurance benefits become due.

Mr. Fiske's address, as well as that of Mr. Jackson, was ordered printed and distributed to the membership of the N.E.L.A.

Secretary Hoover

It had been expected that Secretary Hoover would be present, but, on account of the emergency situation in the coal strike, he was detained in Washington. He did address the convention, however, by long-distance, loud-speaking telephone on Friday morning and expressed regret at his inability to be present. He stated his firm belief in the establishment of super-power systems for the production of electrical energy. Mr. Hoover said he was detained in Washington because of the urgency of the coal situation, but he felt that he had served the electrical industry better there than he would have served it had he attended the meeting.

Attorney-General Daugherty

Also unable to be present at the convention, although he had planned to do so, was Attorney-General Henry M. Daugherty. He was represented by an Assistant Attorney-General, Judge Holland, who presented Mr. Daugherty's address. The Attorney-General came out strongly against government ownership of any kind and said: "Regardless of class, color or means, more money belonging to the people is invested in utilities than in anything else. This is the character of public ownership, I am frank to say, of which I am in favor. I am not in favor of political form of governmental or municipal ownership. The electric light and power companies of the country are publicly owned, for they have more than 1,600,000 security holders among the citizens of this country. That is true public ownership, with the incentive of private development, investment and management, under sane public regulation, and it is preferable to political ownership and political management, which always follow where the municipality or the government owns the public utility."

Public Relations Most Important

Martin J. Insull of Chicago, chairman of the Public Relations Section, in reviewing the year's work of the section, stated that as between finance and public relations he is of the opinion that the latter is the more important in the public utility business, because people with money to invest are not attracted to a business to which the public is antagonistic. He said that it cannot be impressed too strongly on executives that the education of employees in the fundamental economics of the business is a very important part of their duty not only to their individual company but to the industry. Mr. Insull continued: "Public relations as an association activity has only had a distinct place for the past few years, therefore the surface has only been scratched, but the results so far obtained do indicate the great possibilities of this work in placing the industry in its proper position in the public mind."

Budget Control as Aid to Management

In a paper on "Budget Control" Louis F. Musil, treasurer of the Cities Service Company, New York, pointed out that "the budget is too often used only to act as a check on dollars, and because of that reason its administration in many cases has been passed to that man or group of men who were able to check dollars very well, but on whom no recognized responsibility is vested for concurrence in or initiation of policies or programs which make it necessary for the dollars to be checked." Mr. Musil argued for budget procedure not only as a means of economical expenditure, both of operating and capital funds, but also as a means of developing executives and as a means for existing executives to select those men who show executive ability as they plan work ahead on a budgeting scheme. Mr. Musil presented six fundamentals which he said should be incorporated in any budgeting system.

These are:

1. The executive must recognize that his function is to create and enforce policies rather than to work out the problems resulting from such policies. If the expected results of policies laid down are predicted and mutually accepted, there will be little question in determining their merit or in determining the changes that may be necessary.

2. The executive must have knowledge of the control which is exercised by every individual in his organization to whom he subdivides responsibility. He must give evidence as to his knowledge of that control or the lack of that control and reward all individuals accordingly.

3. Individual merit can better be gaged by comparing a man's results with an accepted estimate by him of his future performance than by comparing his results with the results of some other individual.

4. It is therefore necessary for each individual in the order of his responsibility to recognize the necessity of adopting some common system of estimating the possibilities ahead of him.

5. Each individual must recognize the necessity of making his own estimate of what he is going to do and how he is going to do it before he or his associates or his executives can concede his

Digitized by Google

qualifications or expect a full measure of results.

6. Each individual must further recognize that, through such a system, by the constant comparison of results with expectations, the leaks resulting from human omission and human judgment can most effectively be minimized.

SAVINGS BANKS AND CUSTOMER OWNERSHIP

M. S. Sloan, chairman of the committee on relations with savings banks, reported that already twelve states permitted investment of savings or trust funds in utility securities and the effort now is to obtain similar action in other states. Mr. Sloan presented statistics which showed the advantage of public utility investment for this purpose and indicated that these statistics were being presented in various states.

John F. Gilchrist, as chairman of the committee on customer ownership, made a very strong report urging continued and greater activity in this line. The committee has definitely concluded that customer ownership is not to be looked upon as a war measure destined to fade out with the return of normal conditions, but from a financing standpoint alone will become more and more important each year in the future.

The committee indicated that more than 200 electric light companies are engaged in the sale of securities to customers, and, from the eighty-four reporting, it showed that approximately 570,000 shares had been sold during the year. The ratio of total stockholders to total customers for all of the companies is 1 to 17. The average purchase for all companies is about seven shares per stockholder. The selling cost per share was as high as $9 in one instance, but the average for the thirty-five companies was $4.30. One large company was able to reduce its selling cost to $1 per share in the last year. Other companies got down as low as 94 cents and 70 cents.

W. S. Murray, who in a recent report had shown the high actual cost of government-owned utility service in Ontario, was called upon by the Hamilton (Ont.) *Spectator* to retract his statement. Mr. Murray said he had nothing to add to or subtract from the conclusion he sent through.

PUBLIC POLICY COMMITTEE SUPPORTS COMMISSION REGULATION

The public policy committee, S. Z. Mitchell, Electric Bond & Share Company, chairman, reported on general policies of the association and of the industry. "As an industry, it has been our fixed policy to co-operate with the various public utility commissions to the end that regulation should be established on such a sound and equitable basis as to commend itself alike to the utilities and the public whom they serve." While recognizing the fairness of the commission to the electrical industry as a general proposition, the committee realizes that commission control is still in a developmental stage, and says: "We should therefore in this formative period of regulations help evolve a system as perfect as possible."

The public policy committee also gave strong support to the work of the various state bureaus of public information and credited these bureaus with having accomplished a real change in the attitude toward public utilities in those states where they have worked.

INDUCTIVE INTERFERENCE AGREEMENT

One of the outstanding features of the convention was the discussion on inductive interference, on which subject after considerable work the National Electric Light Association, representing the central-station industry, and the Bell Telephone Company, representing the telephone industry, have agreed upon a basis of co-operation to eliminate inductive interference difficulties in the future in so far as practicable. These inductive interference principles have been published as a special pamphlet and may be secured from either the National Electric Light Association headquarters or the American Telephone & Telegraph Company.

VALUABLE PRIME MOVERS REPORT

As usual, the prime movers report attracted great attention. This report is a book in itself, and presents data and analysis on the performance of a large number of large turbines. Experience with Diesel engines, powdered fuel and oil fired boiler plants also is included as a part of the year's work. Other information contained is that regarding improvement in turbine details, maintaining heat balance, tendency in steam pressures and superheat, prevention of clinker adhesion, water softening and lubrication. In general, the committee points out that station equipment has become virtually standardized except in details.

In the discussion on this report, one thing of interest was the statement by Mr. Anderson of the Milwaukee Electric Railway & Light Company with reference to the experience with powdered fuel in that company's Lakeside Station. A description of this plant was given in the April 15 issue of ELECTRIC RAILWAY JOURNAL, page 633.

Mr. Anderson said that if members are willing to accept the fact which he presented, they would no longer question the advisability of installing powdered fuel. The plant has been operating for fourteen months, one-half the time with one 20,000-kw. unit installed and the remainder of the time with 40,000-kw. in equipment installed. During that time 200,000,000 kw.-hr. has been generated without interruptions. Since operating conditions have not been adjusted to the point where the guaranteed turbine water rate has been obtained, and since continuous fuel composition has not been obtained, the most favorable economy and operating results have not been secured so far. Nevertheless, with coal varying from 9,000 to 13,500 B.t.u. and 15 per cent ash, and with a night load only 30 per cent of the day load, the following results have been obtained. Station water rate, 12.7 lb. per kilowatt-hour; steam for auxiliaries (allowing for banking of boilers), 2.4 per cent; boiler efficiency, 84.2 to 85.9 per cent (during steaming periods); over-all plant efficiency, 83.2 to 84.48 per cent; B.t.u. per kilowatt-hour (net), 19,097, and thermal efficiency (net), 17.88 per cent. When more normal conditions are obtained, Mr. Anderson feels confident that a thermal efficiency of 19.2 per cent and a boiler and economizer efficiency of 88 per cent will be obtained. From the tests which have been made he has come to the conclusion that the coal must be dried to contain not more than 7 or 8 per cent moisture, since anything in excess of this amount will cause irregular feeding of the fuel and increase the cost of conveying it. With a unit coal costing $28.78 per 1,000,000 B.t.u. and a unit labor cost of 62.5 cents per man-hour, a total operating expense of 0.5053 cent per kilowatt-hour has been obtained. These figures also can be improved, he declared, when operating conditions become more normal.

Since it was necessary to do considerable pioneering in constructing this plant, it cost more than one should cost now that more experience is available. Mr. Anderson declared that if a plant were construeted now it could probably be built for 10 per cent less than the Lakeside plant. Answering some comments which have been raised regarding trouble with ash issuing from smokestacks of powdered-fuel installations, Mr. Anderson pointed out that 70 per cent of the ash is being removed at Lakeside before it enters the stacks by utilizing washers in the breeching back of the boilers.

The electrical apparatus committee devoted most of its attention to breaker rating and to the automatic substation. This report pointed out that in the central station field the high cost of control equipment operated against the installation of automatic direct-current substations, but that the automatic alternating-current transformer station was coming into wide use.

The accountants showed great interest in the development of budgeting to include construction, operation, materials and supplies and cash requirements from the dual angles of forecast and control.

The American Electric Railway Association was represented at the convention by Executive Secretary J. W. Welsh, by the Director of the Advertising Section, Labert St. Clair, and by the chairman of the exhibit committee of the October, 1922, convention, E. J. Blair of Chicago.

OFFICERS ELECTED

Officers elected for the ensuing year in the N. E. L. A. include Frank W. Smith, vice-president of the United Electric Light & Power Company, New

York, as president of the association, and Walter H. Johnson, Philadelphia; Franklin A. Griffith, Portland, Ore.; J. E. Davidson, Omaha, and R. F. Pack, Minneapolis, as vice-presidents.

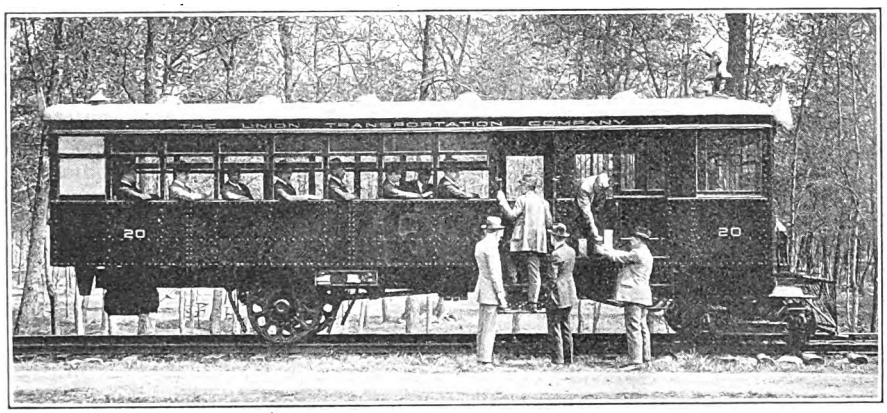
Gasoline Rail Car at Short-Line Convention

This New Type of Car Has Body Extending Over the Engine and Only One Speed Reverse

RAILROAD officials were given the opportunity a few days ago of inspecting the new White rail coach, which was run over the Pennsylvania Railroad from Philadelphia to Washington, a distance of 136 miles. The car made the run to Washington for the annual meeting of the American Short Line Railroad Association. It made daily runs during the convention over the tracks of the Washington & Old Dominion Railway, carrying as passengers representatives of the short-line railroads in attendance at the meeting.

While a number of short-line railroads have been operating gasoline rail cars for several years, it is only recently that the gasoline car has come to attract wide attention of railroad men, not only operators of short-line railways, but officials of some of the country's largest transportation systems.

The rail car driven to Washington



WHITE FORTY-ONE-PASSENGER RAIL CAR WITH BRILL BODY AND FITTINGS. NOW IN SERVICE OF NEW JERSEY SHORT LINE RAILROAD

was built for the Union Transportation Company and is now operating over the company's 25 miles of track, between Pemberton and Hightstown, N. J. A twenty-nine-passenger rail car was placed in service several months ago, and its operation proved so successful that a second car of larger capacity was purchased.

The larger car—the one used on the demonstration run—has a seating capacity of forty-one and a baggage compartment directly in the rear of the driver, who controls the car from the right-hand side. The Brill body, which is of semi-steel construction, extends over the engine of a specially designed White rail car chassis. There is a four-wheel pivotal truck in front and two wheels in the rear. It is governed to a speed of 33 m.p.h. Only one speed is provided in reverse, giving a speed of 9 m.p.h.

The trips over the Great Falls division of the Washington & Old Dominion Railway were considered a severe test for the car as the road is a succession of grades and curves, the grades running as high as 3½ to 4 per cent and the curves to 10 deg., with a frequent combination of both grade and curve. The grades were negotiated with ease, and a fair speed was maintained even on the most severe ascents. To demonstrate its reserve power the car was brought to a stop when midway up a grade and again started. It accelerated readily and continued to top of grades without difficulty. This was true in both forward and reverse speeds.

The principal dimensions of the forty-one-passenger car are as follows:

Length over all	33 ft. 10⅜ in.
Width over all	9 ft. 6 in.
Height, rail to top of ventilators, unloaded	11 ft. 1 in.
Wheelbase, total	22 ft. 5 in.
Wheelbase, pivotal truck	4 ft. 0 in.
Weight complete	21,500 lb.

Developments in Gasoline Rail Cars

THE May 19 meeting of the New York Railroad Club was devoted to a discussion of recent developments in gasoline-driven rail cars, with sidelights on the use of gasoline, electric and storage-battery types of equipment, for short-haul and branch-line service.

W. L. Bean, executive assistant New York, New Haven & Hartford Railroad, delivered the principal address of the evening. He told of his road's experience with three thirty-five passenger Mack rail cars put into service early this year. He advocated the lightweight car with two wheels on the rear end; these should have rear wheels of 36 to 40 in. in diameter, with some form of shock absorber.

Railroad men, said Mr. Bean, should not expect that a light car will have power enough to pull trailers, but he did advocate the development of a larger car, to seat fifty to sixty people, with baggage area of 100 sq.ft. This should operate at 40 to 45 m.p.h. in either direction. Other speakers also favored the larger car, using a type of engine not yet developed, with six cylinders and about 110-hp. capacity. Such a prime mover would require the development of a new transmission and rear axle, since none heavy enough is now available.

In discussing future construction, Mr. Bean said the rail cars should operate at high speed obtained on down grade without vibration and should have double ignition and greater cooling service than is now motor-truck practice. The difficulty in operating signal apparatus, due to the electrical resistance of the roller bearings used in the rear wheels, was mentioned and it was predicted that future construction might involve wheels pressed onto the rear axle.

F. S. Gallagher, engineer of rolling stock for the New York Central Railroad, told about his experiences, back in 1891, in developing gasoline rail cars for the Pullman Company. The first passenger cars used on rails had four wheels, he said, and this was increased to eight to secure better weight distribution. It will be hard to convince railroad men that the six-wheel type will operate satisfactorily.

C. E. R. A. Committee Appointments

PRESIDENT Samuel W. Greenland of the Central Electric Railway Association has announced the following committee appointments for the current year:

Auditing—A. R. Baxter, Indianapolis & Cincinnati Traction Company, Indianapolis, Ind., chairman; J. S. Clark, V. R. Shick and L. W. Vanbilker.

Annual Transportation — H. A. Nicholl, Union Traction Company of Indiana, Anderson, Ind., chairman; F. A. Healey, G. K. Jeffries, W. S. Rodger and F. W. Coen.

Constitution and By-Laws—Charles L. Henry, Indianapolis & Cincinnati Traction Company, Indianapolis, Ind., chairman; F. R. Coates, C. N. Wilcoxon, F. D. Carpenter and A. C. Blinn.

Finance—C. J. Munton, Fort Wayne & Northwestern Railway, Kendallville, Ind., chairman; G. T. Seeley, J. F. Collins, J. C. McClure and Robert I. Todd.

Hotel and Arrangements—S. D. Hutchins, Westinghouse Traction Brake Company, Columbus, Ohio, chairman; Harry L. Brown, John Benham, James H. Drew and C. Dorticos.

National Safety Council — T. A. Ferneding, Dayton, Springfield & Xenia Southern Railway, Dayton, Ohio, chairman; E. Smith, E. M. Walker, F. A. Bundy and P. H. Palmer.

Publicity—H. J. Kenfield, *Electric Traction*, Chicago, chairman; Harry L. Brown and C. J. Laney.

Resolutions—Joseph A. McGowan, Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., chairman; R. A. Crume, J. F. Starkey, Walter Shroyer and G. Muhlhausen.

Rules Governing Interchange of Equipment—C. S. Keever, Union Traction Company of Indiana, Anderson,

Digitized by Google

Ind., chairman; E. B. Gunn, H. Bullen, G. K. Jeffries and C. C. Fast.

Education and Training of Employees—H. C. DeCamp, City Railway, Dayton, Ohio, chairman; A. Swartz and Samuel Riddle.

Uniform Charges for Repairs to Interchanged Equipment—A. W. Redderson, Indiana Service Corporation, Fort Wayne, Ind., chairman; P. V. C. See, R. C. Taylor, M. Ackerman, J. F. Elward and B. J. Jones.

Program—J. P. Barnes, Louisville Railway, Louisville, Ky., chairman; H. C. DeCamp, J. C. Schade, Samuel Riddle and L. G. Parker.

Supply Men—M. B. Lambert, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., chairman; C. C. Creighton, J. A. Donahey, E. C. Folsom, W. D. Hamer, C. T. Dehorn, H. H. Buckman, S. W. Crawford, E. J. Smith, E. S. Sawtelle, G. L. Kippenberger, James C. Jameson and Robert J. Deneen.

Electric Railway Express—F. D. Norviel, Union Traction Company of Indiana, Anderson, Ind., chairman; J. A. Greenland and R. R. Smith.

Transportation—Bert Weedon, Interstate Public Service Company, Indianapolis, Ind., chairman; James S. Clark, Henry Gebhart, W. S. Whitney, C. O. Sullivan, J. H. Pound and R. A. Crume.

New England Club Honors Mr. Foster

THE regular May meeting of the New England Street Railway Club was held on May 25 in Manchester, N. H., in honor of E. C. Foster, the president of the local traction and light system, who had on that day completed fifty years of service in the street railway industry. Nearly 250 members attended the meeting and day's entertainment.

The day closed with a testimonial banquet at which Gov. Albert O. Brown of New Hampshire; A. W. Phinney on behalf of the city of Manchester; Henry C. Page, Worcester; Edward Dana, Boston, and P. F. Sullivan, Boston, spoke of the life work of Mr. Foster and of his unfailing record in never having labor troubles on any of his properties.

The remainder of the program may be summarized as follows: The party met at 11 o'clock at the Traction street carhouse, where four special cars and two Mack motor buses took them to Pine Island Park for a ride and inspection trip. A buffet lunch was served at noon upon the return of the party from the park trip. In the afternoon there was a formal meeting at Lake Massabesic, at which five new members were voted in and a highly interesting paper was presented by F. E. Webster, vice-president Massachusetts Northeastern Street Railway, on the history of street railways and power development in New Hampshire from the time of the first horse car line to date.

A musical comedy entitled "Oh! Boy Jackie" was staged after the meeting by the men employees of the company, and their wives and sweethearts took the feminine rôles. During the evening banquet they also rendered songs and did much to enliven the meeting. Following the show the party again boarded the cars and went to the Brook Street power station, the principal high-tension substation in the city. After leaving this station they went direct to the banquet hall.

American Association News

Convention Exhibits Committee Appointments and Planning

THE committee on exhibits held a meeting in Chicago on May 4 to give consideration to the numerous detail arrangements to be made in connection with the planning of the exhibition, provision of meeting rooms for the convention, etc. Those in attendance were Chairman E. J. Blair, H. H. Adams, C. H. Jones, Roy Holden, J. C. McQuiston, Fred Dell, L. W. Shugg, R. B. Fisher, L. E. Gould and Mr. Bowmen, representing the Chicago Association of Commerce.

After discussing various problems that came up in connection with holding the convention on the great Municipal Pier, such as provision of various kinds of power, air, space for noisy units, space for cars, etc., it was concluded that there were no insurmountable difficulties and that the pier offered facilities which will perhaps result in the most attractive and successful exhibition ever held by the association. After an all-day meeting, including an inspection of the pier, the committee was quite enthusiastic as to the outlook.

It was decided that the minimum space will measure 10 ft. x 20 ft. and that the price of space shall not be in excess of $1 per square foot, the understanding being that as soon as definite estimates of expenses have been prepared the charge will be fixed as much below $1 as is practicable, as the association desires that the manufacturers have space at actual cost. It was decided to provide meeting rooms at the outer end of the exhibit hall so that all delegates will pass through the exhibits in going to and from sessions.

A decision was also reached that it is desirable to operate a restaurant on the pier during the week of the convention and that it should be of just as high grade as is practicable. Space and equipment will be available for this purpose in the middle of the north pier house opposite the exhibit hall, the committee having decided that the south pier house would be better suited for various reasons for the use of the convention.

Exhibits Director Appointed

Extensive study and planning for the convention has been actively pressed by chairman Blair since the committee meeting with the result that a more satisfactory arrangement with the pier authorities has been obtained and a director of exhibits appointed. For this important task C. W. Kelly was selected. Mr. Kelly is secretary-treasurer and director of exhibits of the National Railway Appliance Association. He is already well organized, with an office in Chicago, to handle the full details of the October convention. His long experience in arranging large exhibits of railway materials gives him a thorough understanding of the many ramifications of the work and the committee believes that his service will be of the highest value.

Personnel of Committee

The appointments on the committee on exhibits are as follows: E. J. Blair, chairman, assistant to president Chicago Elevated Railways; W. J. Cummings, McGuire-Cummings Manufacturing Company; Charles H. Jones, Chicago, North Shore & Milwaukee Railroad; H. H. Adams, Chicago Surface Lines; J. C. McQuiston, Westinghouse companies; L. W. Shugg, General Electric Company; R. B. Fisher, Buda Company; W. J. Walsh, Galena-Signal Oil Company; and R. R. Holden, Hagerman Castle Corporation.

Letter to the Claims Association

CECIL G. RICE, president American Electric Railway Claims Association, is sending a series of letters to the members of that organization to apprise them of its work. The sixth in the series was issued on May 13 and reads as follows:

Once upon a time I was touring. It was not my machine. We know we were headed in the right direction, but were not positive we were on the right road.

That's my situation with Claims Association progress. I know where we're going, in spite of everything, but I'd sort of like to have YOU say a few words about the road we're traveling.

Let's see whither we have been going, according to my diary:

April 13—Many commented on this letter. It made them think better of themselves and let the "boss' know we were able to sit up and take nourishment. *Acra* published it.

April 20—Everybody likes the "Code." They realize it is an analysis of their present practice clearly stated. "Dignifies Claims Work."

April 24—It was a "dud." I asked for suggestions and surveys. Guess it was too long or too heavy, for replies have been few.

May 4—Worked hard on that outline of association plans. Some comments. Not many. ELECTRIC RAILWAY JOURNAL published it.

May 13—This is it. Better slow up now until we find out where we stand. Thirteen is lucky. I complete thirteen years of service July 1, 1922.

Here's the point. When touring we sure would have been glad if some one had said: "Buddy, if you're going to Chicago you're headed right," or "You'd better turn off if you want to get there by Oct. 2, because this road is closed."

The same goes for my midnight oil work for the Claims Association. I'd like to know what YOU think about our speed and direction. Are we on the right road? If you have already written me something nice, forget this. If not, shoot me a letter of criticism or commendation, either one. Don't be stingy. Say it out loud. Do it now.

The big idea is to get you to catch up with those four letters because I've written another little book. It's going to stir you up. The "boss" will sit up and take notice too. I am expecting you will want to write me about it sure. "How a Claim Should be Adjusted" is the title of the new book.

It may not be what you expect, but you'll like it all right. Do you want a copy?

Good luck to you until I hear from you or you hear from me.

Wild and Fantastic

Philadelphia Rapid Transit's $290,000,000 Valuation Claim So Characterized by City's Expert

Robert M. Feustel, valuation expert for the city of Philadelphia, forwarded to City Solicitor Smyth on May 23 a letter embodying his views on the railway matter there. The letter was accompanied by the city's figures on the valuation of the Philadelphia Rapid Transit Company. Mr. Feustel held forth city ownership of the entire transit system in Philadelphia as a possible solution of an impossible situation.

Mr. Feustel's letter would indicate that the city does not expect a valuation sufficiently large to enable the company to pay underlying company rentals as well as P. R. T. dividends. The position of the company was set forth in lucid language by Mr. Feustel as one that held no hope for the future in that no valuation figure that could reasonably be fixed by the commission would afford a return sufficient to enable the company to attract the inflow of fresh capital which is necessary for it to keep pace with the growth of the city.

Mr. Feustel rejects the company's valuation claim of more than $290,000,000 as "wild and fantastic," and urges that the recent experience of the city in the Frankford elevated negotiations be not repeated.

As an alternative, he suggests that the city take the company in as its partner in transit business, so that the city could construct high-speed lines as well as provide the money for surface extensions that the company is unable to raise. Mr. Feustel says in part:

> This company has built scarcely a mile of extensions in the last ten years. During this decade, the population has grown by 300,000, and the total passengers carried has increased 80 per cent. The drain upon its resources, caused by its burdensome fixed charges in the form of guaranteed rentals and bond interest, has been in the past and will continue to be the real reason for this company's failure to keep pace with the growth of the city. By absorbing so high a proportion of net earnings as to render the company's financial condition markedly unsound, these guaranteed rentals have made it impossible to attract that constant inflow of fresh capital which a large utility system must have to enable it to make extensions and betterments.
>
> Without attempting to forecast the nature of a judicial determination of value by the commission and the courts, it is significant to point out that before P. R. T. can establish its present stock issue on a 6 per cent basis and continue to meet its underlying obligations, it would have to receive a return of at least 8 per cent on a valuation of at least $150,000,000, a valuation $30,000,000 more than it would cost to reproduce the property today in its present physical condition, and $20,000,000 more than the cumulative investment from 1854 to date, including superseded horse car, cable and early electric lines. Unless the commission departs from its established practice of allowing a 7 per cent return the rate base must be increased to $172,000,000 to produce the $12,000,000 net return required.
>
> Again, disregarding the wild and fantastic claim for valuation put in evidence by the company's witnesses, it is of even greater significance that the company's latest official pronouncement on the transit problem of Philadelphia is based on the tacit assumption that the future holds forth no promise of any revenues sufficient to enable the company to attract new private capital into its system. The company's prediction that only public money will furnish future extensions in Philadelphia traction system, whether of high-speed or of surface lines, may be taken as a frank admission that under its present financial setup, no valuation that could reasonably be fixed by the commission would afford a return sufficient to enable the company to meet the necessities of the growth of Philadelphia.
>
> How the necessary public money should be obtained is an important problem; but this is, after all, not the most vital part of the transportation problem. Whether the funds are raised by borrowing or by assessment of local benefits, they will be raised if and when they are needed. But before they are raised a satisfactory answer should be received to the question: "What treatment will be accorded the necessary public money which is contributed toward the construction of an adequate transportation system in Philadelphia?"
>
> It is not the purpose of this letter to formulate such an answer. It is sufficient to say that the facts in the report transmitted herewith must be the foundation upon which any effective partnership between the city and the company is reared. In general it may be said that two courses are open to the city. The first is to acquire the ownership of the entire existing system and add to it the units deemed necessary. The second is to share with the present owners the proceeds of the joint system which will result from the city's money contribution.

His report accompanying this letter contains 259 printed pages with many tables and charts. The following table appears in the book and is entitled "The Basis for a Fair Valuation":

REPRODUCTION FIGURES	
No. 1—Company's estimated cost of reproduction new based on prices as of date of closing of inventory June 30, 1919	$290,729,742
No. 2—Check of company's cost of reproduction new based on prices as of date of closing of inventory June 30, 1919	187,553,326
No. 3—Check of company's estimated cost of reproduction new based on prices of June 30, 1919, after deducting depreciation which has actually taken place	147,339,822
No. 4—Cost of reproduction new based on latest prices available—first quarter of 1922	147,870,575
No. 5—Cost of reproduction new based on prices of the first quarter of 1922, after deducting depreciation which has actually taken place	116,504,042
INVESTMENT FIGURES

No. 7—Cumulative total investment or historical cost as of June 30, 1919, including horse car, cable and early electric lines	128,835,370
No. 8—Cumulative total investment or historical cost as of June 30, 1919, after deducting superseded property	109,568,007
No. 9—Original cost new of the present existing property	108,784,068
No. 10—Original cost new of the present existing property, after deducting depreciation which has actually taken place	89,024,521

Dispute Over Paving Settled

Diplomacy has won the day in the threatened stoppage of electric railway transportation at Muscatine, Ia., for at a conference between President B. J. Denman of the Muscatine city lines and the Councilmen meeting in special session the terms of the railway were accepted and the demands of the city withdrawn.

The city had insisted on a repaving program which would have entailed an expense of $50,000 on the company. The program called for relaying of track and paving with brick on several streets. The company offered a substitute program of paving between rails with macadam, paving street intersections with brick or asphalt to harmonize with the city paving and the re-equipment of certain lines with better, but not new rails. The city refused to accept this offer at first and the railway finally declared it would suspend operations and tear up the rails, dismantling the railway plant in case the $50,000 expenditure was insisted on. The railway officials set the date for a final show-down at May 20.

Citizens of Muscatine rose up in arms when the possibility of losing the railway system became known. Their protests to the City Council resulted in the calling of a special meeting to which President Denman of the traction lines was invited. The company's offer as outlined in a letter to the Councilmen a few weeks previous was accepted unanimously.

$150,000 for Extensions

Differences between the city of Dallas, Tex., and the Dallas Railway, which resulted in a public hearing before the City Commission on a proposal to restore the 5-cent fare, have been amicably settled, and the railway will continue to charge a 6-cent fare on all its lines. The matter was finally disposed of when the officials of the company, through Judge W. M. Holland, president, gave the City Commission formal notice that the stockholders were ready to repay into the company's treasury $111,400. The city claimed that this sum had been wrongfully applied to the payment of dividends. It will now be made available for betterments and additions to the company's lines, such expenditures to be added to the value of the company's properties.

It is announced that in addition to the $111,400 returned to the company's treasury by its stockholders, the excess earnings during April will bring the sum available at this time for extensions and betterments to nearly $150,000.

Bacharach Bill a Menace

Measure Is Unlikely to Pass, but It Attracts Much Attention as a Dangerous Symptom

Another hearing was held on the Bacharach bill before the House judiciary committee in Washington on May 23. This measure, which proposes to limit the power of federal courts in injunction proceedings, is not expected to become a law in the nea future, but great interest is shown in the measure, and the hearings are well attended by many who believe the bill is a dangerous and improper one. The hearing of May 23 was stopped by the demand for the presence of members of the House on the floor to answer to roll calls, and another hearing was set for June 8.

The chief witness at last Tuesday's hearing was Alfred P. Thom, general counsel of the National Association of Railway Managers, who appeared in opposition to the measure. He took the position that the proposed bill was unconstitutional in that it would emasculate the equity powers of the Federal courts, rendering them incapable of granting relief.

ONLY ONE PROPONENT HEARD

The only proponent to be heard in behalf of the bill was S. A. Ettleson, Corporation Counsel of the city of Chicago. He related experiences of the city government of Chicago with the traction company there, and said the enactment of the Bacharach bill would save the citizens of Chicago $60,000 a day. Corporation Counsel Ettleson stated that the traction company and the city of Chicago had effected a settlement of their disputes in 1917, the traction company accepting an ordinance for a 5-cent fare, and for the payment to the city of a portion of the gross receipts. In violation of its contract, he claimed, the traction company applied to the Illinois Public Service Commission for an increase in fare because of war conditions, and was given an advance of 1 cent, then 2 cents, and finally 3 cents. The city of Chicago appealed to the State courts, the witness said, and the case finally reached the State Supreme Court, which sustained the commission. An appeal to the United States Supreme Court was then taken, but without redress, as that court sustained the lower courts. Thereupon the elimination of the Public Utilities Commission became an issue at the next election on the ticket headed by Governor Small. It was the understanding that a State Commerce Commission would be appointed in place of the utilities commission and that the new commission would reverse the decision of the former body, the witness said.

When Gov. Small appointed the commission the city of Chicago appealed for a reduction in traction fares and after hearing extending over four months, and the taking of 4,000 pages of testimony, the railway fare of Chicago was fixed at 5 cents. The company then appealed to the federal courts, and was granted an injunction which is still in force. It was contended by the Corporation Counsel that by the enactment of the Bacharach bill the State Commerce Commission would no longer be hampered by the Federal Courts in carrying out the wishes of the people.

The State Bar Association of Ohio was represented by F. E. Eagleson, of Columbus, who contended that the bill if passed would deprive the Federal courts of fundamental jurisdiction. Mr. Eagleson paid his respects to Mayor Hylan of New York, stating that his Honor's testimony was unworthy of consideration, and that his intimations that justice was perverted behind the scenes showed him to be unfit to be a judge and unworthy of the high honors bestowed upon him by the City of New York.

Mayor Curley Attacked

Thomas Carens writing in the Boston *Herald*, for May 18, says that by practically unanimous vote the Massachusetts House of Representatives the day before consigned to oblivion all the attempts by Mayor James M. Curley and others to bring about a repeal of the Boston Elevated Railway public control act of 1918, or to attack its validity. Mr. Carens says that this action followed the most brilliant speech of the present session, delivered by Speaker Benjamin Loring Young from his old place on the floor, and in which he bluntly charged that Curley's whole course during the session has not been in the interests of the car-riding public, but of the "same old gang" which brought the Boston Elevated to the verge of bankruptcy in 1918 and which would jump at the chance to take it back in its present rehabilitated condition.

Reduction of Three Cents an Hour Announced

The Colorado Springs & Interurban Railway, Colorado Springs, Col., has made an arrangement with its employees whereby a uniform reduction of 3 cents per hour in the rate of pay will take effect on June 1 next. For the train service in cents per hour the scale will be as follows:

	One-Man Cars	Two-Man Cars
First three months.....	52	45
Second nine months.....	55	48
After one year.....	57	50

Wage Agreement Reached

The New Orleans Railway & Light Company and the Amalgamated Association, have reached an agreement as to the scale of wages which is to obtain during the ensuing year, beginning June 1, 1922. The pay is to be 45, 47 and 51 cents an hour, according to length of time in the service, as is now being paid under the existing pay agreement. Judge Foster approved the agreement as presented by Receiver O'Keefe on May 17.

Utilities Not Insured Against Loss by Commission

"The Public Service Commission does not insure a utility against loss. If poor business judgment has been exercised in the management of a property, the public should not suffer thereby. Neither should future rate payers be called upon to reimburse the company for losses sustained by insufficient rates granted to past consumers of the company."

The ruling was made by the Public Service Commission of New York on May 22 in an order issued to the Western New York Utilities, Inc., of Medina, directing that it return to electric rates charged the public in Albion, Barker, Lynonville, Medina and other places and fourteen towns in Orleans, Niagara and Monroe counties prior to Feb. 23, 1921, when the company increased its rates. The present rates are to be set aside June 1 and the former rates charged are to prevail for a year and thereafter until changed by the commission. The average reduction is about 15 per cent.

Men Vote on Wage Reduction

Employees of the Connecticut Company in all cities where the company operates have voted this week on the wage reduction proposition, and while the figures have not been compiled for tabulation it is a known fact that at least 90 per cent, if not more, have voted against the decrease proposed by the company. At present most of the regular trolley men work nine hours a day and at the 55-cent wage scale prevailing for employees of more than a year's standing they receive an average of about $4.95 a day. If the company's scale of 50 cents an hour were accepted it would mean a reduction to $4.50.

A year ago trolley men were receiving a wage scale of 54 to 60 cents an hour based on length of service. Under the decision of an arbitration board of three members a reduction of 8½ per cent was agreed on, and the present scale provides 47 cents an hour for the first three months, 51 cents for the next nine months and the maximum of 55 cents for employees of over a year's experience.

New Scale in Effect

An agreement has been reached covering the rate of wages to be paid employees of the Auburn & Syracuse Electric Railroad, Auburn, N. Y., for the year beginning May 1, 1922. The following scale in cents per hour is in effect:

Operators of one-man cars:
- First six months 41
- Second six months 43
- Thereafter 46½

Interurban:
- Passenger trainmen 46½
- Freight and express 48¾

To employees other than the above who are members of the Amalgamated Association of Street and Electric Railway Employees of America, wages were reduced 3½ per cent from the rates in effect up to May 1, 1922.

Federal Charter Refused

Present Fares at Vancouver May Be Extended Until New Commision Functions

The petition of the British Columbia Electric Railway, Vancouver, B. C., for a federal charter, which would have the effect of taking the railway out of provincial and civic control, was refused by the railway committee of the private bills committee of the Dominion parliament on May 2. This action followed opposition by the provincial government, the city of Vancouver and the Union of Canadian municipalities, which foresaw similar moves elsewhere should the application succeed.

The government of the province of British Columbia has in the meantime agreed to the appointment of some kind of commission which would pass upon the present problems of the British Columbia Electric Railway or which would form a permanent public utilities commission. All the cities and municipalities affected with the exception of the city of Vancouver have agreed to extend the present fares until such committee functions, which cannot be until the next session of the provincial house which takes place next autumn or winter.

The position in Vancouver and surrounding district is that the present rates of fare, which were extended from time to time by agreement, stop on June 30 next unless another extension is granted. The fare in Vancouver would then revert from 6 cents to the 5 cents stipulated in the franchise. The company intimates that it cannot operate on a 5-cent fare.

Last year foreseeing this difficulty as well as the necessity for obtaining stability if new capital was to be obtained, the company proposed a new franchise with the cities and districts affected but negotiations failed. As an alternative to the Dominion charter, it proposed a retention of the present fares for a number of years and this may now be the solution.

The company is faced with requests for a number of extensions to its railway lines, the necessity for building new power plants at a cost of $10,000,000 and the need for extending its gas distribution system, all of which need new capital.

Further Action Taken in Taxpayers' Suit

Mayor Hugh M. Caldwell, of Seattle, Wash., has taken the first steps to relieve the general tax fund of all liability in connection with the administration, maintenance and operation on the municipal railway. This action is in compliance with the State Supreme Court's recent decision in the "Fourteen" taxpayers suit. After conference with the other city officials, Mayor Caldwell announced that he would at once recommend to the City Council that the legal, accounting and purchasing work of the railway system be segregated from the work of tax-supported departments, and hereafter paid out of the railway revenues. Heretofore, the corporation counsel's office had cared for all the railway legal business involving the employment of a considerable number of assistants and claim agents. Numerous employees of the city comptroller's office have given all their time to railway accounting, and the general railway purchasing has all passed through the regular city purchasing agent. These offices are all maintained by general taxation, and under the Supreme Court decision, no money so raised can be used for the railway.

Bill for Transit District Deferred

The George Louis Richards bill, reported in the ELECTRIC RAILWAY JOURNAL issue of May 20, which would create a Metropolitan Transit District for Boston and take two divisions from the Eastern Massachusetts Street Railway and add them to the Boston Elevated so as to have a unified system within a single-fare area, will not be passed by the Massachusetts Legislature this year. The legislative committee on street railways has decided to redraft the measure so as to submit the street railway provisions in it to the State Department of Public Utilities for a study and a report to the next Legislature.

While the Boston Elevated favored the original bill the Eastern Massachusetts opposed it, but the opposition is not to the general idea of a unified system. If the Eastern Massachusetts is assured of adequate compensation for the division it is called upon to give up it will approve the plan. Taking the property by the right of eminent domain would place the valuation in the hands of the courts, and probably be acceptable to the company.

Will Draft Ordinance for Interurban Operation

It has been agreed upon by officials of the Grand Rapids, Grand Haven & Muskegon Railway, Grand Rapids, Mich., and Chairman Gallmeyer of the special railway committee of the City Council that, so far as the operation of interurban cars over city tracks is concerned, an ordinance should be drafted by each side looking toward relief in the congestion caused by the interurban cars in Monroe Avenue. These drafts will be the basis of an ordinance which will be presented to the City Commission.

This matter has been before the City Commission unofficially several times. The railway has no franchise from the city, having operated for several years under a rental contract with the Grand Rapids Railway. This contract terminated about a year ago, and the street railway officials declined to renew it, on the ground that it interfered with the city cars to such an extent as to make the operation of the interurbans undesirable at any price. It also claimed that the great weight of the interurban cars caused more depreciation to the street railway equipment than the amount of the rentals. The interurban company brought suit in the Circuit Court to enjoin the city railway from ousting it. This suit still is pending, but negotiations are under way to settle it out of court. City Commissioners are unanimous that interurban cars cannot be permitted to continue operations in the downtown business streets.

Ordinance Restraining Jitneys Upheld

The Fourth Court of Civil Appeals at San Antonio, Tex., has reversed the decision of Judge Robert B. Minor in the Seventy-Fifth District Court in the "jitney" case and has ordered the temporary injunction granted by Judge Minor dissolved. This temporary injunction restrained the city officials from enforcing the provisions of the jitney ordinance, which restricted the operation of the jitneys in San Antonio to certain lines and forced them to operate on a fixed and previously announced schedule.

The ordinance rerouting the jitneys was passed by the city on Dec. 1, 1921, and was twice amended by the city, the last time on Jan. 30, 1922. It directed the removal of jitneys from all the principal downtown streets and rerouted lines through the residential district in such manner that they would nowhere be in competition with the electric railway lines. The ordinance was enacted as a compromise agreement with the traction company in return for reduction in passenger fares. With the dissolution of the injunction granted by Judge Minor the city is now enforcing the terms of the ordinance.

Frank R. Williams, chief counsel for the jitney men, announced that the jitneys would fight the ordinance through the court of last resort. No notice of appeal has yet been filed. Meantime the city is enforcing the ordinace.

Schenectady Situation Threatening

John H. Reardon, the International officer who is in charge of the situation in Schenectady, N. Y., went to Detroit to confer with W. D. Mahon, International President of the Amalgamated Association. On the return of Mr. Reardon, a meeting of the Schenectady division will be called, and it is declared probable the crisis will be precipitated on a motion for a vote of confidence in the present officials, who are confident of support. In this connection it will be recalled that James F. Hamilton, president of the Schenectady Railway, has refused to deal with the union on a new agreement while the present officers are in charge of its affairs.

Since May 1 the Schenectady men have been working without a contract and as a result the company has not taken up any question with the union officials. This is taken as an indication by many employees that the organization is not functioning, and has caused many to lapse in dues.

Chicago to Vote on Rapid Transit Plan

Voters of Chicago will have a chance next November to decide whether they are to have subways, if recommendations of a subcommittee of the Chicago City Council are approved. This plan was adopted on May 19 at a meeting where the presidents of the surface and the elevated lines reported that they had no new proposal for transportation improvement to offer. The subcommittee then directed its engineers and lawyers to prepare plans and an ordinance to be submitted to the Council.

The city has more than $30,000,000 available in the traction fund and it is intended to use this for an independent subway system if an agreement cannot be made with the existing companies. The city administration is opposed to making an arrangement with the companies and while the Aldermen are more friendly it has been impossible up to the present to get on a common basis.

The chairman of the Council committee, Alderman Schwartz, is anxious to have his own plan favored. This calls for the issuance of a form of security to purchase the existing lines and it is not likely that this will be considered favorably until the value of the certificates has been proved by a test case in the Supreme Court.

Receivers Freed from Custody

Receivers Huff and Lee of the Steinway Railway won a victory over District Attorney Dana Wallace, who tried to prevent them from charging a separate fare on the Steinway lines. The lines, until the receivership, were a part of the New York & Queens County Railway. The receivers were freed from custody when Justice Cropsey in the Queens Supreme Court, Long Island City, sustained the writ of habeas corpus. He said in his finding that there was no obligation upon the receivers to operate the lines so that a 5-cent fare would be continued over the New York & Queens system and suggested that the Transit Commission could fix a joint fare, but this question had not been brought into the argument.

"The Reason Why" for Extension on a Scientific Basis

Maps of the Twin Cities are made by the Twin City Rapid Transit Company, Minneapolis Minn., showing every structure in either city, and each fall these maps will be brought up to date by addition of structures erected or started up to September. Buildings of each year will be distinguished by different colors. These maps will be the basis of the Minneapolis Street Railway or the St. Paul City Railway toward applications or demands for extensions of the lines in any part of either city.

Needs in other ways may be studied from this street railway map just as well as the needs of more or new street car services, such as school houses and parks. They will show the trend of growth and the character of this growth, whether in residences, apartments, duplexes, or industries. H. W. Ralph, superintendent of schedules, and his assistant, Peter Skurdasvold, have been working on the maps since last September, and only the loop district sections are unfinished. The reason for working on outskirts first is that there is where the demand comes first for extensions of lines. Decision as to extensions of trolley lines will hereafter be on a purely scientific basis.

Mr. Ralph said that heretofore it had been necessary to guess at such important matters as to growth and need for line extensions, but that now in defining to the authorities its attitude toward various requests for service extensions of all kinds, even to preparation of streets for trackless trolleys, the company would find the maps invaluable.

Regulate Buses or Lose Trolley!

Electric railways must cease operation if jitneys and buses are allowed to go unregulated, in the opinion of Alfred Fischer, director of the Public Utility Information Bureau, Ann Arbor, who has published two articles on the "plight of Michigan's electric lines" in the Detroit *Saturday Night*.

The proper relation between the two systems of transportation is for the bus to act as a feeder in thinly developed districts. This Mr. Fischer makes quite clear. He explains that the first agitation for bus regulation has demanded that the buses shall be operated by trolley companies. He differentiates between city bus service and the intercity bus service, and he points out that excessive taxation of the truck operators will be unfair. Legislation must equalize the burdens of the common carrier paying taxes to the state for a private right of way and his competitor who operates over highways maintained by the state.

The final solution of the ownership or control of transportation means will be based on good service at cost to cover the expense of giving that service. Those who can give the service best will win. This, Mr. Fischer feels, is the moral to gain from the competition of the bus, the discussion as to public ownership and the problems still facing the railways.

Seeks to Hasten Hearing

The Supreme Court has been requested to advance for hearing the case of Henry F. Mueller and others vs. Samuel W. Adler, on appeal from the District Court for the Eastern District of Missouri, involving the United Railways of St. Louis. Mr. Adler, a mortgage bondholder, filed a suit for a receivership and enforcement of a lien against the company, alleging that the railway had acted contrary to its covenants in its deed of trust. Under this bill a receiver was appointed, who is still acting.

News Notes

Must Continue Service.—The Public Utilities Commission has ordered the Indiana, Columbus & Eastern Traction Company, Springfield, Ohio, to continue operation of its Columbus-Orient, and Lima-Defiance branches until Sept. 1, when the case will be reopened for further argument.

One-Mile Municipal Line Privately Operated.—The Minneapolis (Minn.) Street Railway will operate a municipally owned trolley line for the benefit of residents between the Columbia Heights Street car line and the city's water filtration plant, more than a mile distant and in an adjoining county. The company will furnish a motorman and the power and will assume all liability. Only one car will be required and a 5-cent fare for the round trip is planned. The car and the track are furnished by the city, which will pay the company $4,000 a year and will take on no liability insurance. Service is to begin on May 1. The line has been utilized to haul materials to and from the water plant.

Sioux City Line Presents Alternatives.—A fare increase or a wage cut is the solution to the present problem of the Sioux City (Ia.) Service Company, which the president, R. J. Dunham, offered to city officials and representatives of the employees. Mr. Dunham said that the debt of the company is half the value of the property, and that the net loss during the year ending Dec. 31, 1921, was $35,262. The amount of the suggested wage cut was not stated, but Mr. Dunham said that a decrease or increase of 1 cent an hour means a loss or gain to the company of $8,500. In the last two years, according to officials of the city, the fare has been increased from 5 cents to 7 cents, with four tokens for 25 cents, and the city has ruled the jitneys from the streets.

Traction-Highway Line Under Road Commission.—The Indiana Highway Commission is about to become the owner of a stretch of interurban railroad—only a few hundred feet in length, to be sure, but none the less a railroad. The "line" is a stretch of track across the traction-highway bridge at Terre Haute, now owned by Vigo County. The bridge is used by the Terre Haute-Paris line of the Terre Haute, Indianapolis & Eastern Traction Company and was built by Vigo County. The interurban company pays an annual rental for using the bridge. Now that the highway commission has taken into the state system the road on which the bridge is located, it is necessary also to take over the trackage. The commission will send an engineer soon to confer with county authorities on the purchase price.

Financial and Corporate

North Shore Line Earnings Increase

During the calendar year 1921, the Chicago, North Shore & Milwaukee Railroad showed an increase in gross earnings of $307,137. This record was made in spite of a decrease in amount of traffic of approximately 9 per cent due to the unfavorable business conditions, which were especially pronounced in the manufacturing cities of Kenosha, Racine and Milwaukee. The increase in gross earnings is attributed mainly to the change in intrastate rates in Illinois and Wisconsin which became effective on July 14, 1921.

CONSOLIDATED INCOME STATEMENT, CHICAGO, NORTH SHORE & MILWAUKEE RAILROAD
(Including Milwaukee City Lines)

	1916	1917	1918	1919	1920	1921
Operating revenue	$1,157,191	$1,751,373	$2,899,975	$3,237,921	$4,193,869	$4,507,366
Operating expense	714,887	1,114,512	1,856,038	2,319,464	3,229,048	3,440,761
Net revenue	$442,304	$636,861	$1,043,937	$918,457	$964,621	$1,066,605
Taxes	66,038	95,680	185,822	163,101	151,746	225,844
Operating income	$376,266	$541,181	$858,115	$755,356	$812,875	$840,761
Non-operating income	6,208	4,858	9,470	17,879	10,332	11,972
Gross income	$382,474	$546,039	$867,585	$773 235	$823 707	$852,733
Fixed charges	237,966	266,580	332,506	341,396	390,196	463,013
Net income	$144,478	$279,459	$535,079	$431 839	$433,011	$389,720

In the annual report prepared by President Britton I. Budd, a decrease in net income of $43,291 is laid to the operation of the first six months. During this time operating costs were abnormally high and could not be overcome during the remainder of the year notwithstanding an increase in rates as already mentioned and a general decrease in wages and salaries effective on June 16.

The amount expended for capital requirements during the year was $591,683. During the year the company issued and sold $500,000 of fifteen-year, 7 per cent sinking fund collateral notes secured by first mortgage bonds. On June 15, 1921, $260,000 of serial notes fell due and were paid. The company also paid during the year $72,000 of equipment notes and $71,000 of the ten-year and fifteen-year sinking fund notes through the sinking fund.

Mention is made that work has begun on the construction of a new brick passenger station at Kenosha which will be ready for use this spring. A new brick passenger station at Indian Hill is also under construction.

During the year, employee accidents were reduced approximately 17 per cent, and accidents resulting in injury to the public or damage to public property decreased approximately 24 per cent. Collisions with vehicles, collisions between cars and derailments were reduced 33 per cent, as compared with the previous year. These results were accomplished through the various channels of the safety organization which held more than 100 safety meetings of employees, distributed literature and conducted periodical inspections of equipment and properties.

The comparative income account for the years 1920 and 1921 and a consolidated income statement for the past six years are presented in the accompanying tables.

COMPARATIVE INCOME ACCOUNT FOR 1921 AND 1920 CHICAGO, NORTH SHORE & MILWAUKEE RAILROAD

	1921	1920	Increase or Decrease
Operating Revenue:			
Passenger revenue	$3,980,879	$3,686,631	$294,248
Freight and express	477,898	471,496	6,401
Miscellaneous revenue	42,029	35,542	6,487
Total	$4,500,806	$4,193,669	$307,136
Operating expenses:			
Way and structures	$491,160	$373,331	$117,830
Equipment	352,358	311,912	40,445
Conducting transportation	1,377,462	1,461,226	83,764*
Power	458,302	432,020	26,282
Traffic	100,972	65,833	35,140
General and miscellaneous	660,507	584,725	75,782
Total	$3,440,761	$3,229,047	$211,713

* Decrease.

$10,000,000 Freed by Court

By a decision of the United States Supreme Court on May 15 that the New York statutory gas rates of 80 cents were confiscatory during the calendar years 1919 and 1920 the seven gas companies allied with the Consolidated Gas Company receive approximately $10,000,000 which had been impounded pending the outcome of the rate cases.

The decision just rendered was delivered in cases appealed by the State and county authorities from the decision of the United States District Court of New York City that the rates were confiscatory. Appellants contended that the Consolidated decision was not binding in the other cases in that it covered cost conditions in 1918 and eight months of 1919, while the other cases presented different conditions in the last four months of 1919 and throughout 1920.

The questions passed upon in the original decision of the court in this case were referred to in an editorial in the ELECTRIC RAILWAY JOURNAL for March 11, 1922.

Plan for Sale and Reorganization Approved
